Rising prices, by lessening the worth of every deferred payment, of every investment that is in the nature of a loan, aid debtors at the expense of creditors and so dishearten thrift. By increasing the uncertainty of every investment, they discourage saving. For the same reason they inevitably foster speculation, aid the promotion of wildcat schemes of every variety, develop the conditions that end in crisis and panic. Their period is marked by mushroom growth of unbridled extravagance, with blatant display of waste and folly. While a few gain, the many suffer. Because salaries or fees do not rise as fast as expenses, men ordinarily intelligent and fair become exasperated and unreasonable, and look to the ballot box for revenge against their troubles. Political upheaval follows, with rash changes that usually do more harm than good, because not based on reason. The universal discontent gives morbid vigor to envy and jealousy, sets class against class, breeds passion and prejudice. We call it a period of unrest. Society is for the time thrown out of adjustment. There is laxity in observance of law, in personal conduct. Interest in religion declines. Demoralization is widespread. The vices of prosperity are more dangerous to a people than the vices of adversity.

Of course, the danger lies not in the proper enjoyment of the fruits of honest labor and fair enterprise. It comes from the artificial stimulus that leads one man to gain by another's loss. This is neither natural nor inevitable, but it will continue its mischief as long as we use for a measure of value anything that makes business a gamble and puts industry at the mercy of chance.

We are now measuring value with an elastic tape, an accordeon, a telescope. Today we are using a yardstick that may expand or contract over night. Next year it may be as short as your arm or as long as you are tall. In fifteen years it actually did shrink by more than one-third. Everything indicates that after a temporary check due to business depression, with its lessened demand for money, the standard will keep on shrinking. Everything indicates that the use of bank checks will increase and at any rate for years the supply of gold will keep on growing faster than the trade needs of the world. Mining engineers tell of deposits hardly as yet touched. Still lower grades of ore may be made profitable by the invention of new processes. Edison was quoted not long ago as predicting the further downfall of gold thru the discovery, sure to be made sooner or later, of cheap means of extracting immense quantities from some Southern clays. The sands of the shore, the waters of the sea, are mines that any day may be forced to give up their hidden wealth. More than that, it is not absolutely inconceivable that some day we may be able to make gold in the laboratory.

No new discovery, however, need double our alarm. Already we know enough to fill the future with doubt. So hard-headed a man as Andrew Carnegie, in a gift of millions of dollars to the Carnegie Institution at Washington, stipulated that a certain part of the income should be set aside as a sinking fund against "the diminishing purchasing power of money." Ought that to be necessary? Is there no other way to forestall the future? Can we not somehow find a measure for value that shall approximate in stability and permanence the platinum rod in Washington which gages all the yardsticks of the land?

Yes, it can be done, and easily. What we need is a standard that measures in terms of purchasing power. It is to be found in the tabular or composite standard, long urged by the economists, and now perhaps soon to be realized. If an international commission on the cost of living be created, as recommended by the President, its prime task should be to provide for a continuous computation of commodity prices by a clerical force at The Hague under international auspices, which will from day to day or week to week announce the level of the price rate of the world. Then those who would could make their contracts on the basis of purchasing power as shown by the price rate. Compulsion would not be necessary. If the self-interest of financiers did not lead them to the use of the purchasing-power standard voluntarily,

it would be thereby proved not the hoped-for remedy. If, on the other hand, its use became general, that alone would go far in smoothing the troubled seas of commerce. To complete the benefit, international regulation of currency would in time be sure to follow.

In time the nations of the world will join in using their fiscal machinery to establish and maintain a permanent standard of value. After that there will be no such thing as a general rise or fall of prices with all the hardships of maladjustment thereby entailed. The pendulum of business that swings to and fro between hard times and good times, the extreme of crisis and the extreme of extravagance, will at any rate lessen its arc. Merchants and manufacturers will read the future with greater accuracy and so be encouraged to greater enterprise. Wealth will be more rapidly created, more widely diffused. All the world will be the gainer.

BOSTON, MASS.

An Alp-Horn

BY AGNES CARTER MASON

THRU the rosy summer twilight
Rings an alp-horn sweet and clear;
While, from peak to peak rebounding,
Leap the echoes far and near;
And my spirit, lightly musing,
As it listens to the call,
Hears the "olifant" of Roland,
Blown too late at Roncevalles.

From the region of romances
Drifts that scene before my eyes,—
Christian princes, Moorish chieftains,
Clashing blades, before me rise:
In the eager front of battle
Swings the far-famed Durandal,
Wielded by the gallant hero
Of the pass of Roncevalles.

Bold in feud and sage in counsel,
Roland's friend fights at his side.
"Sound thine olifant, O Roland!
Now, I pray thee, sound!" he cried.
"There were cowardice in yielding,
But it were no shame to call
To our aid the king thine uncle,
Who is near to Roncevalles."

Durandal grows never weary;
Not a foot the Christians yield.
But, surprised, close-prest, outnumbered,
Thick their bodies strew the field.

All too late the wounded hero,
As his braves around him fall
Wakes with magic horn the echoes,
Over fatal Roncevalles.

You remember how they found him,
In his death a hero still,
With his wondrous sword beneath him
As he lay upon the hill;
That the king might know full surely
None had captured Durandal,
Tho no living voice could answer,
When he came to Roncevalles.

When we lie in quiet kirkyard,
Friend and neighbor, side by side,
All the victories forgotten
That we won with ease and pride,
Would but some remember kindly
That *one* hard-fought, hard-won field,
Where, tho crushed, betrayed, surrounded,
Ev'n in death, we did not yield!

Ah! the King, the King is coming!
When the fighting all is done,
He shall mark the sword close-holden,
And pronounce the battle won!—
Sweetly ends the music. Faintly
Dies the echo with the day;
And upon the snowy summits
Fades the rosy light away.

MONTCLAIR, N. J.

Literature

The Way of the Lord

In this little volume* the voice of a prophet is heard. It will shock the Pharisee and bore the Philistine, but touch responsive chords in many hearts. The author describes herself in "Who's Who" as "poet, suffragist, socialist and freethinker." Those who look for rime and rhythm and stanzas, for measured cadences and clever tricks of speech, for rich and radiant imagery, panting passion, or sensuous reverie, may hastily decree that this is not poetry. But there is something in this elevated prose, these pregnant sentences cut up into capitalized fragments, these simple devices for arresting the thought and yet forcing it onward, that gives to the reader the peculiar thrill of genuine poetry. The book abounds in quaint conceits, extraordinary flights of imagination, terrifying glimpses into the heart of things that should not be, and dazzling vistas beyond the flaming walls of the world; and there is often music, sweet or stirring, in the language.

The poems paint no Utopias, present no nostrums, sing no praises of favorite social remedies. They breathe the passion for justice, the scorn of self-complacent conventionality, the ardent longing for a nobler order of society, the sincere worship of the god of tomorrow. Some of these pictures, drawn with wonderful simplicity and force, haunt the soul. It is impossible to forget the musings of the rich mother and the piteous plight of the poor mother whose dead children cry for vengeance and whose living children plead for mercy while she hesitates whether to kill or to forgive. The freedom of thought on religious and social questions is manifest thruout, but it leads a courageous soul along the paths of reverence and sympathy. If narrow creeds and empty ceremonies are denounced in words that sting and burn, the really sacred things of life are held aloft. A poem entitled "On the Fair Day" reads as follows:

God went into the market-place of the world
On a great fair-day.
All the stalls were kept by priests,
Who kept crying to the crowd:
"Which god will you buy?"
"Mine is the only true god."
"Hold to the god of your ancestors"
"My god compromises with sin and sells you indulgences."
"My god is easy going."
"My god is profitable."
"My god is fashionable."
"Come and buy with gold."
"Come buy with observances."
"Come buy with trumpetings."
And God turned wearily away,
And said to the stars:
"How long it takes mankind to grow up!"

This poet sings with sanity and insight that carry conviction of life and death, virtue and happiness, truth and beauty, the Bible written thru the ages by all the prophets of the race, "the great procession of the Lamb of God," the ceaseless atonement made by the bearers and destroyers of man's sin, the wealth of nature and the fruits of common toil in which all sons of men should share, and the spiritual riches that cannot be taken away. She knows the highway that leads from life to more abundant life, illumines it with the light of the ideal, and may, without fear of being misinterpreted, call it "The Way of the Lord." Her husband, Prof. T. K. Cheyne, the well-known liberal theologian, has, with characteristic literary tase and discernment, arranged the poems into cycles.

*THE WAY OF THE LORD. *By Elizabeth Gibson Cheyne.* Published by Mrs. Cheyne, South Elms, Oxford, England. 5s

Medieval History

Mr. J. B. Bury continues on a larger scale his "History of the Later Roman Empire from Arcadius to Irene," published over twenty years ago, in *A History of the Eastern Roman Empire*,[1] which covers what the author calls the Amorian epoch of the Eastern Empire.

[1] A HISTORY OF THE EASTERN ROMAN EMPIRE FROM THE FALL OF IRENE TO THE ACCESSION OF BASIL I (A.D. 802-867). *By J. B. Bury.* New York: The Macmillan Company. $4.

that is, the greater part of the ninth century. Mr. Bury sets out to disprove the long-accepted belief that the social atmosphere of the Eastern Rome was always immutably the same and to trace the curve of its development within the period under consideration; and he holds that the Amorian epoch was not merely a sequel to a previous age, but really meant a new phase in Byzantine culture.

The book inspires a delightful confidence. It leaves no doubt of the wide learning and open-mindedness of the author. As an historian Mr. Bury feels himself called upon to know all available sources and to distinguish the reliable from the untrustworthy as he goes. This honesty in dealing with his sources of information runs thru the text and culminates in a dozen short appendices in which mooted questions are discussed at greater length.

The bibliography will be welcomed by scholars and students of the field, for it is select. Instead of listing all books relating to the field it "includes most of the works cited in the notes of this volume. Those which it omits are referred to seldom or do not bear directly on the period." The volume ends with two indices, one in English, the other in Greek.

Mr. Bury combines two faculties not commonly found in the same person; he is a thoro investigator and at the same time possesses the ability to present his findings in clear and readable English. His style is simple but assuring. Now and then he has departed from customary spellings, such as *Hadriatic* for *Adriatic*, or *sovran* for *sovereign*. There is no doubt that he has good reasons for these variations, and who is prepared to say that the changes are not for the better?

The work is a notable contribution to the literature of the Eastern Empire and is a new proof of the soundness of scholarship for which Mr. Bury has long been known.

One who thumbs the pages of Mr. Fletcher's *Making of Western Europe*[2] will observe that it is an attempt to trace the fortunes of the children of the Roman Empire, and that each chapter is preceded by an "argument" which may lead him to believe that here is a book in which the human side of the Middle Age shall appear as it does in the acts and scenes of a play. He will quickly be undeceived by noting what the chapters contain, as he may do by examining the "argument" more carefully. This comprises the usual *Time, Events* and *Chief Actors*. It will be found that the *chief events* are the common facts which have always formed the staple of medieval history, and that the *chief actors* are rulers or men who figured in politics. In short, the book is written from what by some has been designated the" English" point of view; it is *political* history. Persons and facts are made more important than the institutions under which they existed. The psychology of the "Children of the Roman Empire" does not engage our author. Political figures, not men or things, are the occupants of these pages, as they will appear from the index, which is a sort of Who's Who in the Middle Ages. In short, the book treats an old subject in the orthodox way—which, be it noted, the author acknowledges in the preface: "This book, then, puts forward no claims except to give the old story of the 'Making of Western Europe' in rather simpler form than usual."

After such an admission one has no reason to expect new matter in these pages. However they do not always contain important old matter. For instance, in explaining the much-discussed vexation of Charlemagne at being crowned Emperor by the Pope, the book advances the traditional and inadequate reasons; and it is significant that Bury's new volume on the Eastern Empire gives a much better discussion of this point than this book on the Dark Ages, the central figure of which is this same Charlemagne.

But Mr. Fletcher claims nothing more than a "simpler" form than usual, and, if by that he means a more readable product than usual, he has achieved his aim. In this respect the volume may be considered original. The style is excellent and carries the reader without making him aware of the vehicle. It is interspersed with passages from other languages and allusions which are ingeniously explained whenever it seems de-

[2] THE MAKING OF WESTERN EUROPE. Being an Attempt to Trace the Fortunes of the Children of the Roman Empire. *By C. R. L. Fletcher.* Vol. I, The Dark Ages 300-1000 A.D. New York: E. P. Dutton. $2.50.

sirable. For these qualities we like Mr. Fletcher. His impartiality in treating the history of a church with which, he admits, he is out of sympathy also deserves commendation. The skill with which he has handled his matter and given it shape, gives reason to believe that, if he would, he could imbue that shape with the life which once it had. We know the facts of Medieval History that appear in this volume; but we need to know more of the spirit which animated those facts.

The Education of Women in China

Forty years ago a missionary to China wrote that in the city of Kiukiang she could not by diligent inquiry find a woman who could read. Another writer reported that when she went into a Chinese home and opened a book, saying: "These are Chinese characters, can any of you read?" some appeared amused, others were surprised at the question, while one or two put on an air of offended dignity, intended to convey the impression: "No, indeed; I am not so strong minded as that." That such a condition could exist is not surprising when we hear that in the same country a certain man, after listening with imperturbable calm to the plea of a missionary that he should send his daughter to school, pointed to a horse standing near by with the inquiry: "Can you teach that horse to read and write?" adding, with an air of finality, when he received a prompt reply in the negative: "If you cannot teach an intelligent horse, what can you expect to do with a woman?"

Yet, as the great sage facetiously remarked, "Women, indeed, are human beings," altho, as he hastened to add, "as different from men as earth is from heaven," a statement that will bear more than one interpretation. And the women of China have come themselves to feel that Confucius perhaps did not say the last word on the subject of the education of women when he said that the aim of female education was "perfect submission, not cultivation and development of the mind." They are venturing, therefore, to fare forth upon the sea of knowledge in spite of the fact that "it is a law of nature that woman should be kept under the control of man and not allowed any will of her own," and in face of Confucius's further statement that in the other world the condition of affairs is exactly the same, for the same laws govern there as here. Just how the wise man was so well informed upon the latter point we do not know. In regard to the first point China's daughters are venturing to disregard the utterance of their oracle.

The story of this surprising adventure is told in Miss Burton's *History of the Education of Women in China.** The author says: "Chinese women were not utterly uneducated before 1843, when the opening of the treaty ports made it possible for Western education to enter China, but aside from certain exceptional cases, the training they received was chiefly in regard to conduct, and the tale of their intellectual achievements before that time is soon told." An account follows of the first attempt of the missionaries to lighten this mental darkness. This is succeeded by the story of the development of the schools from the days when pupils had to be sought and then bribed to remain to the present time, when missionary and government schools are taxed far beyond their powers to supply the demand for education to Chinese and Western subjects. That the patient, long and continued work of the first missionary teachers is largely responsible for bringing about this remarkable development is unquestioned, altho it is equally unquestioned that China, in this respect, as in many others, is feeling the pulse beat of the rest of the world and anxious to share her neighbors' progress.

Yet while great encouragement is felt among teachers, missionary and otherwise, and while the present opportunity seems almost unlimited, there is not room yet for satisfaction. The schools are working their way toward better organization and equipment, and will not rest until they have both. The very character of the schools is undergoing change. Formerly their aim was not so much, Miss Burton says, to train the intellectual powers as to produce Chris-

*The Education of Women in China. *By Margaret E. Burton.* New York: Fleming H. Revell Co. $1.25.

tian character. "It was self-evident that the strength and beauty of such character would be a supremely important element in the usefulness of these girls in after life; it was less apparent that the ability to see clearly and think accurately would add greatly to their power as Christian women" (pp. 6, 68). But this necessary change is taking place with results which manifest the wisdom of the policy.

It is further the part of the missionary schools to see that their work shall be thoro, for the danger that besets the cause of woman's education in China is superficiality. "There seem to be at least two dangers—a strong demand for *showy* accomplishments and for quick methods." "So great is the demand for women teachers that the viceroy is about to open a woman's normal school in this city (Tientsin), the avowed purpose of this school being 'quickly made teachers.'" Altho these "quickly made" teachers have been better than no teachers, they have not shown themselves equal to the demand that has been made upon them, and a reaction in favor of slowly made teachers is inevitable—in fact, it has already begun.

India Under Lord Curzon and After

Mr. Fraser's book,* altho imposing in appearance, is much more of the nature of journalism than of history or literature. Covering events of such recent occurrence, Mr. Fraser makes no pretense of having arrived at a critical estimate of their historic value, and he writes frankly as an admirer and partisan of Lord Curzon, altho he does not defend quite indiscriminately all Lord Curzon's policies and reforms. If it were not that Mr. Fraser disclaims in his preface any personal friendship for Lord Curzon, and declares that he occupied thruout Lord Curzon's viceroyalty the position of a detached spectator, it might be thought that *India under Lord Curzon and After* had been written from the inside. To some degree this is true, notwithstanding Mr. Fraser's disclaimer, for Mr. Fraser was editor of the *Times of India*, and it is usually advantageous for the Government in India to furnish the influential Anglo-Indian newspapers with much first-hand information.

It is curious that Mr. Fraser should single out the partition of Bengal as one of the most outstanding reforms of Lord Curzon's administration. The greater ease of governing the province after division and the likelihood of a better preservation of law and order are the points that commended the partition to Mr. Fraser. He dismisses as foolish and vain clamor the intense dislike shown by the Bengalese to vivisection, and apparently it must have come upon Mr. Fraser as a great surprise and a weak yielding to agitation when, with the removal of the Indian capital to Delhi, the Province of Bengal was practically reunited. It can hardly be imagined that Lord Curzon approved the abandonment of Calcutta as the seat of government, any more than he approved the reversal of his policy of partition. His speech in the House of Lords at the time of the announcement of the determination of the Government was characterized by most unstatesmanlike heat, and when we read Mr. Fraser's description of his deep interest in the improvement and upbuilding of Calcutta, it is easy to sympathize in his feeling of pain at the blow given to the prestige and prosperity of the city by the removal of the seat of government.

Another controversy in which Mr. Fraser is whole-heartedly on the side of the late Viceroy is that which brought about Lord Curzon's retirement—the dispute between the Viceroy and Lord Kitchener about the control of the military forces in India. In this instance the new order of things which was brought about by Lord Kitchener's insistence and the complaisance of the moribund Balfour Government—an order which was reluctantly acquiesced in by Mr. Morley—has not yet been put to the test. Before the Liberal Government came into power in December, 1905, Lord Minto had been appointed to the viceroyalty. Lord Minto had accepted beforehand Lord Kitchener's contention, and the crisis was at an end. It is impossible to believe that Mr. John Morley, as he then was, really approved of the arrangement

*India under Lord Curzon and After. *By Lovat Fraser.* New York: Henry Holt & Co. With Illustrations and Map. Pp. ix, 496. $4.

which made the commander-in-chief of the army in India practically independent of the civil power. But the Liberal Government did not desire to reawaken the angry feelings that had attended the controversy, and with some slight and futile modifications Lord Kitchener's "reforms" were allowed to stand. The supremacy of the military is contrary to all English constitutional principles, and there seems some ground for Mr. Fraser's fear that England "will yet have to rue the day when the Government in England refused to support the rightful authority of the Viceroy in India." Under Lord Kitchener the new system worked well, but a system should not be such as to lend itself easily to the ambitions of any military chief. While, as has been said, Mr. Fraser's book is frankly partisan, it is at the same time a highly readable account of political and economic conditions in India, such as might well be expected from an able and trained journalist. From this point of view it is of interest to the general public, and it certainly might be read with much profit by at least four-fifths of the 670 members of the English House of Commons, in whose hands rests the final power of the Indian Empire.

Principles of Economics. By F. W. Taussig. New York: The Macmillan Co. 2 Vols. Pp. xxxv, 547; xviii, 573. $4.

The admirable clarity which marks Professor Taussig's other writings is equally impressive here. Rarely has a technical subject of this kind been set forth with such a combination of simplicity and accuracy. The style is not weighted and the sense made obscure by the use of a pseudo-scientific language, one of the commonest failings of the specialists. Happily also the usual sections on methodology and definitions and dogmas have been omitted, and one is glad to find such a theory as that of subjective value dismissed briefly as being in the judgment of the author "of less service for explaining the phenomena of the real world than is supposed by its votaries." In fact, the book is one which, while regarded with high favor by scholars, will appeal particularly to educated and intelligent beginners; the author does not presuppose any special and systematic study of political economy. Much attention is given to the functions of the leisured classes. One observes that, tho Professor Taussig does not look forward to any quick decay of the system of competition, he always exhibits a sympathetic attitude toward socialism. Perhaps the most successful part of the book is his consideration of the growth of industrial corporations and the problems which they raise. If in some cases his views may seem a little old-fashioned, a little tainted with John Stuart Mill, it may be replied that fashions do not always change for the better.

The Empresses of Rome. By Joseph McCabe. New York: Henry Holt & Co. Pp. x, 357. With Illustrations. $4.

This theme has attracted many writers —Gibbon and Merivale, Baring-Gould, Stahr, Silvagni, Serviez. But in all cases a limited period is covered or the personalities of the empresses are hard to distinguish upon the crowded stage or (as with Serviez) anecdotes of a piquant kind are too eagerly accepted. Our author, while neglecting nothing which the moderns have written, has quite evidently based his narrative upon the Greek and Latin authorities and upon other materials which the archeologists have brought to light. That the work has been admirably done every one familiar with "Peter Abelard" and other historical volumes by Joseph McCabe will take for granted. In this dry-as-dust age there are few like him, few who combine with the graces of style a patient and critical scholarship. Yet those of us who were brought up on Gibbon and who learned to revere him as the first of historians will not find the picture vitally changed. McCabe shows Messalina still flaunting her vices, Agrippina still pursuing her more masculine ambitions, and Poppæa still representing the gaily-decked puppet of that luxurious world. Mr. McCabe is not one who thinks that the breaking of images lifts a man up to the realms of genius. Perhaps he is a little too much interested in the frailty of woman, tho the virginal eye is sometimes saved from corruption by the use of Latin and Greek footnotes. But if so, let us remember how

lightly the marriage tie rested upon its victims in those days. And it was a time when women played a role in politics. They had debating clubs; they signed election addresses; they buttonholed the Senators and forced them to rescind the sumptuary laws. The book is a social study which will make an equal appeal to the student and to the casual reader. That cannot be said of many books of the time.

The Charterhouse of London. Monastery, Palace and Thomas Sutton's Foundation. By William F. Taylor. Illustrated. New York: E. P. Dutton & Co. Pp. xiv, 283. $2.50.

Mr. Taylor's contribution to the literature of historic London is well worth a place in any London lover's library. The old Charterhouse forms one of the most picturesque among the many picturesque survivals of older London, and its history of peace and devotion, of tragedy and heroism, of pageant and treachery, and of scholarship and charity, is one that enormously enhances the interest that attached to the buildings from their beauty and Old-World quaintness. The story that Mr. Taylor relates goes back to the Black Death, in the middle of the fourteenth century. It covers the foundation of the original Charterhouse, on the graveyard purchased outside London by the charitable that the victims of the plague might rest in consecrated ground. In less than three hundred pages Mr. Taylor has clothed his history with abundant human interest. He enlists the sympathy of his readers for the patient, devout and earnest Carthusian monks—the one order that apparently kept itself unspotted from the world in an age of luxury and licentiousness. He describes the long and bitter struggle between Henry VIII and the inmates of the Charterhouse, the martyrdom of more than half the monks, among whom was the prior, Blessed John Houghton, whose arm was nailed over the gateway of the Charterhouse as a warning to his obstinate followers. He tells of the reluctant submission of the less heroic of the members of the order, of the confiscation of the Charterhouse and its conversion into a palace, first by Sir Edward North and then by the Duke of Norfolk. He tells then in some detail the story of Thomas Sutton, how he acquired his enormous wealth, his charities, his purchase of the Charterhouse, and his devotion of it to charity as a school and almshouse. An interesting letter from Sir Francis Bacon is part of the story of the Sutton foundation. Bacon was anxious to upset the disposition that Sutton had made of his property, and allow it to revert to his somewhat distant heirs, with considerable incidental benefit to the king. His arguments in favor of this course are worthy of the great lawyer in their adroitness and acumen, and his hint to James I of the profit that would accrue to the crown from the transaction shows his knowledge of the character of the first of the Stuart kings of England. In spite of Lord Bacon, however, the foundation stood, and tho the Blue Coat Boys have now migrated to Godalming, in Surrey, and the greatest of the English public schools no longer occupies the old buildings, the Poor Brethren of the Charterhouse still remain in this great Old-World corner in the heart of modern London.

The Making of the Nations. Scotland. By Robert S. Rait. With Illustrations, Maps and Plans. New York: The Macmillan Co. Pp. xii, 320. $2.

It seems strange that Scotland should have been so late in being accorded a place in the "Making of the Nations" series, but Mr. Robert Rait's volume was well worth waiting for. Mr. Rait is the author of the best work on the Scottish Parliament, and as a Scotsman with Oxford traditions and point of view, he is perhaps capable more than any other writer living, of holding an even balance when giving an account of the long strife between North and South Britain. It is a savage story that Mr. Rait has to tell, filled with wars, forays and invasions; treachery and heroism; religion, demonstrated by the power alike to endure and to inflict persecution; a tale of hardihood and cruelty, which scarcely varies from the barbaric features of the earliest days until the union with England is well within sight. Thru all the intricacies of internal jealousies and strife, and of foreign policy which had but one aim—that of preserving the national life by keeping in check the great and powerful southern neighbor—Mr.

Rait steers a steady course. He has no brief for Robert Bruce, nor for King Edward I of England; none for Queen Mary, nor for her rival, the English Elizabeth. He does not champion Roman Catholic, Episcopalian or Presbyterian; but endeavors simply to unravel the tangled threads of a history which has suffered more than usually from the snarls of prejudice and of unreasoning partisanship. The one point on which he has a theory which he endeavors to substantiate against English and Scottish prepossessions is in regard to the essential oneness of the Scottish nation. He combats vigorously the theory held by the late John Richard Green that the Southern Scot was of the same blood as his English neighbor, whose language he spoke with a difference; while the Gaelic-speaking Highlander was of alien race as well as of an alien tongue. The slight veneer of English names, manners and language, in Mr. Rait's opinion, never affected the racial unity of the North and South. The Highlander was simply the Scotsman who retained his ancient language, while the Lowlander was the Scotsman who, for convenience and for the sake of commerce and peaceful intercourse had adopted the tongue of his greater, wealthier and more powerful neighbor. Mr. Rait brings abundant evidence in support of his contention—a contention which has to meet a prepossession rather than a well-founded theory. There is certainly no such difference in character between Highlander and Lowlander as there is, for example, between Welsh and English, or between Scotch and Irish; and there is far more difference between the Lowlander and the Englishman of the northern counties than there is between the inhabitants of Midlothian and the men of Argyll and Skye.

Literary Notes

....Fresh memoirs of the Comtesse de Boigne are announced by Messrs. Charles Scribner's Sons under the title, *Recollections of a Great Lady.*

....In our review, July 18, of Mrs. Corra Harris's latest novel, "The Recording Angel," we quoted the price as $1 instead of $1.25 net as it should have been.

....A valuable series of articles by the Rev. J. B. Ceulemans on the history of American philosophy from a Catholic standpoint is running in the *Ecclesiastical Review,* Philadelphia.

....Two books that should attract attention during the Presidential campaign are A. G. Sedgwick's *The Democratic Mistake* and W. L. Ransom's *Majority Rule and the Judiciary,* published by the Scribners, the latter with an introduction by Theodore Roosevelt.

....A sensible book for young mothers and a valuable addition to a nurse's library is *The Healthy Baby,* by Roger H. Dennett (Macmillan; $1), a children's specialist. Doctor Dennett gives simple directions for the care and feeding of infants in health and during minor illnesses, wisely advising the mother to call in a physician, if her baby is seriously ill.

....M. Anatole France, of the French Academy, has lately returned to Paris from a visit to the French colony of Algeria and the French protectorate of Tunis: a journey made in part by automobile, in part afoot, and, for a certain distance, on camel's back. In "Thaïs" the author described the desert: now he has seen it. Perhaps he has found the material for another book?

....We have worn out two copies of the *A. L. A. Catalog* answering inquiries of our readers as to the best books on this or that subject so the new supplement comes just in time to relieve the strain. It contains about 3,000 titles of books published 1904 to 1911 inclusive, and suitable for a popular library, indexed, classified and annotated. (Chicago: American Library Association Publishing Board; $1.50.)

....F. Hamilton Jackson's *Rambles in the Pyrenees and the Adjacent Districts, Gascony, Pays de Foix, and Roussillon* is a large quarto volume of more than 400 pages, illustrated from numerous and pleasing drawings and plans by the author, and from excellent photographs (Dutton; $6). The French side of the boundary line is adhered to. This book is a rich jumble of material interesting to the traveller and reader of travels.

....The scandal aroused by the publication in Paris of the volume by H. R. H. Eulalia, Infanta of Spain, now translated as *The Thread of Life* (Duffield; $1.25), was caused not so much over the contents of the book as by astonishment that a royal princess of a Catholic kingdom could hold such liberal views. Her observations on the power of the press, the servant question, the etiquet of courts, the independence of women,

etc., are superficial, but for the most part sensible. The most radical of them is advocacy of divorce by mutual consent, doubtless induced by her desire to free herself from Prince Antoine d'Orleans, whom she married two years ago. He agrees with her on this point, but will have to become naturalized in France to obtain a divorce.

....Miss Elizabeth Jordan has collected the serial chapters of a new "May Iverson" book. *May Iverson Tackles Life* (Harpers; $1.25), in which the ever-delightful author describes the life in a convent school and a group of girls, her classmates at St. Catherine's, who should be immortal. Mabel Blosson, Maudie Joyce, Mabel Muriel Murphy and Kittie James are a joy to know, and May Iverson's asides to the "gentle *but* intelligent reader" are delicious!

....The author of "The Dangerous Age," Karin Michaelis Stangeland, has written a sequel, *Elsie, Lindtner* (John Lane; $1.20), telling the subsequent adventures of that neurasthenic heroine after she has passed thru the dreaded "forties," the dangers of which she morbidly exaggerates. The sequel hints at one reason for her unrest in the fact that Elsie had never had children. They would have made her less selfish, and consequently less foolishly introspective.

....Principal P. T. Forsyth shows the breadth of his culture in his new volume, but his mixture of art, ethic and theology in *Christ on Parnassus* (Doran; $3) will not establish his reputation as an art critic nor clear up any of the hazy places in his theology. The lectures are full of noble thought and Christian idealism, but the style lacks the vivacity and pungency to which we are accustomed in Principal Forsyth's more theological writings, and one finds the book heavy reading.

....A compact historical manual, *English Literature,* written by John Calvin Metcalf, professor of English literature in Richmond College, appears from the press of the B. F. Johnson Publishing Company, of Richmond, Va. The writer has endeavored to preserve a balance between the interest of literary movement or tendency, and the personal interest of the individual writer. Out of 440 pages, eighty-five are devoted to the period from 450 to 1558. We notice that the picture of "Dove Cottage" (page 304) was reversed in the manufacture of the photogravure.

....From the Library of Congress comes a volume of more than ordinary interest to students of American cartography. Philip Lee Phillips, F. R. G. S., Chief of the Division of Maps and Charts, has edited *A Descriptive List of Maps of the Spanish Possessions Within the Present Limits of the United States* The list was originally begun by the late Woodbury Lowery, in whose possession were 306 of the 750 maps described. Upon his death in 1906 this important collection and the unfinished manuscript of the present *List* came into the keeping of the Library of Congress. The book as now issued is a model of bibliographical method.

....The class of 1907 of Bryn Mawr publishes for a classmate a memorial volume, *Carola Woerishoffer: Her Life and Work:* Miss Woerishoffer was killed in an automobile accident in September, 1911, after a short life remarkable for its efficient devotion to social service in the cause chiefly of labor. She will be remembered as the young woman who appeared in court, at the time of the strike of the shirtwaist makers in 1909, prepared to furnish bail for some hundreds of young girls who had been placed under arrest. Miss Ida Tarbell writes an account of the author's life and work, and the remainder of the volume is occupied with personal tributes.

....A posthumous work of the late General Arthur Lillie, of the British army, entitled *Rama and Homer,* has been edited for publication by G. Keith Murray, and now appears from the press of Kegan Paul, Trench, Trübner & Co., Ltd. ($1.75). The book arrays extensive evidence to establish parallelisms between the Homeric stories and the Râmâyama, and is designed to prove that the Greek epics are indebted to the Indian, rather than vice versa. General Lillie's service in India enabled him to gather for this volume much interesting material in a field comparatively little known to western readers; but his conclusion that "Homer must have seen the Râmâyana of Valmîki" seems phrased, at least, so as to beg one of the great questions at issue in Homeric study—that of the single authorship of the poems.

....Mr. Harold Begbie's versatile pen has been busy recording the religious experiences of some converts to Christianity in India, made thru the efforts of the Salvation Army. To secure first-hand information the author went to the East and placed himself under the tutelage of the noted Fakir Singh, the former English official, who resigned, in middle life, his post in the Indian civil service, and soon reappeared with Indian garb and name to introduce the Salvation Army into Bombay. These stories about *Other Sheep* (Doran; $1.25), which Mr. Begbie writes down as a companion volume to "Twice Born Men," are full of descriptions showing the degradation, refined cruelties and psychical abnormalities into which devotees of the Indian religions are often led, as well as the reclaiming power of Christianity.

....There is no literature of today more difficult for the foreigner to understand than the German with its strange mixture of naturalism and romanticism, of decadent sensuality and youthful vigor. The volume of studies of the *Masters of Modern German Literature,* by Prof. Otto Eduard Lessing, of the University of Illinois, and published in Dresden (Carl Reissner; $1.35), serves a useful purpose as a guide thru this tropical forest. It contains besides a general introductory essay an analysis of the works of Detler von Liliencron, Richard Dehmel, Gerhardt Hauptmann, Arno Holz, Heinrich Mann and Thomas Mann. The author is sufficiently sympathetic with the movements he describes to interpret them fairly.

....In 1877 Jean Richepin was already a poet and a personality—but he was far from being an academician. He was as poor as he was young: and as quick-tempered. When the editor of the *Revue des Deux Mondes* accepted his story, "Sœur Doctrouvé," but warned him that the *Deux Mondes* never paid for first contributions, Richepin demanded the return of his manuscript. *Pas d'argent, pas de nouvelle!* Buloz was not offended—and paid for the story. Doubtless it was worth it. And there is one more point to this little anecdote. When Littré issued a supplement to his great dictionary, in the following year, he made this entry:

> CHANTONNEMENT, *sm.* Action de chantonner. . . . Qui engourdissaient ses derniers souvenirs comme un chantonnement de vieille nourrice. (J. Riche in, *Revue des Deux Mondes,* 15 mars, 1887.)

All this was when M. Richepin was twenty-six years old: a youthful age for a contributor to the *Deux Mondes* and to the Dictionary of the Academy.

....Mr. Edmund Gosse has reached the age of literary reminiscence. The evidence of it lies in a delightfully written volume of episodes and characterizations, entitled *Two Visits to Denmark* (Dutton; $2.50). Mr. Gosse gives an account of his contact, in 1872, and again in 1874, with the social and intellectual life of one of the smallest, but one of the most cultivated countries of Europe. Mr. Gosse was privileged to meet on terms of friendship Hans Christian Andersen, George Brandes, Niles Gade and many others, who, tho they are strangers to most readers in English, assume in these pages a warm and vivid personality that makes one forget the fact. Students at the university in Copenhagen, whom Mr. Gosse met, did not, it appears, discuss athletics, and this leads him to recount a tale of the visit to Cambridge of a professor from the University of Cracow. The late Henry Sidgwick showed the guest "the youth of the place disporting itself on the cricket-field and in the boats. The Polish visitor made no comment, was indeed so markedly silent that Sidgwick was obliged to say 'You have nothing like this, I suppose at the University of Cracow?' 'At the University of Cracow,' the professor wonderfully replied, 'we hygienate with the *bal masqué.*'" As for the students at Copenhagen, Mr. Gosse formed an impression that "ideas, as distinguished from facts, took a much more leading part in their conversation than would be the case among a similar group of English lads."

....The remarkable work of Brunel and Russell, the designers of the "Great Eastern" in 1858 is recalled by J. Bernard Walker, the editor of the *Scientific American,* in *An Unsinkable "Titanic": Every Ship Its Own Lifeboat* (Dodd, Mead; $1). The "Great Eastern," it will be recalled, "ran over some submerged rocks off Montauk Point, Long Island, and tore two great rents in her outer skin, whose aggregate area was equivalent to a rupture ten feet wide and eighty feet long. In spite of this damage, which was probably greater in total area than that suffered by the "Titanic," the ship came safely to New York under her own steam. "When we have learned the lesson of the 'Titanic' tragedy," says Mr. Walker, "we shall reintroduce in all future passenger ships those simple and effective elements of safety—the double skin, the longitudinal bulkhead and the watertight deck—which were conspicuous in the 'Great Eastern,' and which alone can render such a ship as the 'Titanic' unsinkable."

....The National Society of Colonial Dames has done an important service to the colonial history of Massachusetts by publishing, thru the Macmillan Company, and under the careful supervision of Charles Henry Lincoln, Ph. D., *The Correspondence of William Shirley, Governor of Massachusetts and Military Commander in America, 1731-1760.* (Two volumes, $5.) The volumes contain, besides an introductory study by Doctor Lincoln, 340 of Governor Shirley's letters, and transcriptions from upward of a hundred other manuscripts relating to his life, hitherto unpublished. William Shirley was one of the few popular English governors of the colonial period. It was he who organized and headed the expedition in King George's war which resulted in the capture of Louisbourg. It was he who, by reserving coin for the redemption of colonial paper, succeeded in fixing the currency on a specie basis, thus "giving to Massachusetts the name of the 'hard-money Colony,' a name which she bore until the Revolution." These letters of Shirley shed interesting light on the treatment of the Acadian

settlers by Great Britain. In 1745, he wrote the Duke of Newcastle that "all the people, beside all the Indians, would join the French troops, if France should invade the peninsula." In 1746, he proposed that "the most obnoxious of the French inhabitants of Nova Scotia" be deported, but advised "keeping the rest in the country, and endeavoring to make them useful members of society under his Majesty. Had the proposals of the Massachusetts Governor been vigorously carried out by Newcastle," says Doctor Lincoln, "the adherence of Acadia might have been secured in 1746, the question would have been settled, and the removal of her inhabitants in 1757 avoided."

....The Home University Library (Holt; 50 cents) has won a really remarkable measure of respect from thoughtful readers in the comparatively short time since its first volumes were issued. *The Evolution of Industry,* by D. H. MacGregor, professor of political economy in the University of Leeds, gives a succinct outline of the changes that have resulted in the present condition of the working classes. In *A History of Our Own Times,* Mr. G. P. Gooch presents a résumé of the chief political developments of the period from 1885 to 1911. The chapters dealing with the leading Powers severally have a tendency to concentrate upon such problems as the balance of power, the awakening of the East and the Colonization of Africa. A final chapter is devoted to arbitration, socialism and the relations of the white and colored races. John Gray McKendrick, emeritus professor of physiology in the University of Glasgow, is the author of *The Principles of Physiology,* a thoroly readable volume in which stress is less exclusively anatomical than is usually the case in elementary treatments of the subject. Anatomy, chemistry and physics, we are told, make the tripod of sciences upon which physiology rests. A fourth volume of the series, *Psychology, the Study of Behavior,* embodies the endeavor of William McDougall, M. B., reader in mental philosophy in the University of Oxford, to answer, among others, the following questions: What is psychology? What questions does it seek to answer? What are its methods? What progress has it made? What may we hope from it in the way of addition to our power of understanding human nature, and of contributing to the welfare of mankind? The volumes of the series are characterized by a fresh, unacademic temper, broad and penetrative analysis of the latest accessible data; and by the further fact that they stimulate the reader to further study of subjects which they merely introduce. He is never encouraged in the lazy complacency of believing that mastery of the primer means mastery of the subject.

Pebbles

Dr. Henry Van Dyke has written a new national hymn. Dr. Van Dyke does this about once a year, being unable to wean himself of the habit.—*Chicago Record-Herald.*

Salesman.—Shirt, sir? Will you have a *négligé* or a stiff bosom?

Customer.—*Négligé,.* I guess. The doctor said I must avoid starchy things.—*Tit-Bits.*

The *Wall Street Journal* in imitation of Prof. Irving Fisher's use of mathematical symbols in economics solves the political problem by the following equation:

$$\frac{GOP}{TR}=WW$$

A writer who, perhaps, means well, suggests that "The Beth Book" might be followed by "The Thecond Beth Book' and "The Nekth Beth Book."

Thith ith the wirth thuggestion we have theen lately in regard to Bookth.—*Woman's Home Companion.*

LE "BOUTON" ELECTORAL AUX ETATS-UNIS.

[From a French newspaper.]

L'emblème des partisans de Taft porte, audessous de l'image souriante du président, cette légende: "Hallo Bill."

Sur les boutons Roosevelt on peut lire cette devise: "Mon chapeau est dans l'arène." Tout homme de l' "Ouest sauvage" en comprend le sens. Car, suivant un vieil usage du pays des cowboys, on jette, en signe de défi, son chapeau à terre quand on veut provoquer quelqu'un.

Les boutons du progressiste Wilson n'ont pas de devise mais portent simplement cette inscription: "For president, 1912." Ceux de Clark ont pour légende le commencement d'un refrain populaire qu'on peut traduire ainsi: "On le leur a bien rendu—puisqu'ils ont frappé mon chien."

The Librarian of the *Boston Evening Transcript* publishes the following biographical sketch of "Ibid" on account of the frequent inquiries made by readers who have come across references to this versatile writer and cannot find his name in the card index:

IBID.

Ibid, or Ibidimus, Marcus Alias Hortensius. Roman poet and rhetorician. Ibid is supposed to have flourished about 240 B.C., tho in his own autobiography—a work of doubtful authenticity—he says: "I was born Aug. 17, 185 B.C." He is the author of "De et Fabula," "De et Nox" and over three hundred other books. He invented the ablative absolute, for which he was rewarded by the Senate with the proconsulship of Ultima Verba. His military career seems to have led him also into Northern Italy, for it is recorded that on one occasion, after a long siege, "he took Umbrage, and retired into hither Gaul." Umbrage is, perhaps, a false reading for Umbria. The latter years of his life are clouded in mystery, for he lived mostly in exile. He passed his time in writing the vast number of poems, which were subsequently published under his pen name of "Anon." Finally he seems to have transgressed the laws seriously, for he was hanged in Effigy, a town in Lower Egypt, on Christmas Day, 102 B.C.

The Independent

Entered at New York Post Office as Second Class Matter
Publisher, Clarence W. Bowen
130 Fulton Street - - - - New York

A WEEKLY MAGAZINE FOUNDED IN 1848
One Year, $3.00 Single Copies, 10 Cents

Single copies over six months old, 25 cents. Postage to any foreign country in the Universal Postal Union, $1.75 a year extra; to Canada, $1.00 extra. Subscriptions will be received for other periodicals, and clubbing rates will be granted as low as those offered by any responsible agency.

An order for the change of an address should be received two weeks before the change is to take effect. The old as well as the new address should be given.

For the convenience of our subscribers we will send on receipt of the publisher's price any book reviewed or advertised in our columns.

Volumes of The Independent are completed at the end of December and June, and a full index is furnished free on application. Neat binders holding in book form thirteen current issues will be furnished for 45 cents.

If the numbers comprising any semi-annual volume are returned to us prepaid in good condition with $1.50 we will bind the volume in handsome and substantial half buckram and deliver it free anywhere in the United States.

We are always glad to receive articles for examination, but writers desiring the return of their manuscripts, if not accepted, should send a stamped and addressed envelope. Even so, we cannot hold ourselves responsible for their return. Authors should preserve copies of their manuscripts.

Advertising rates will be furnished on application.

The Congress Session

THE session of Congress will not stand in the record as one that yielded legislation of great and enduring value. Its partial failure was due to the inevitable disagreement of the two branches, one Democratic and the other Republican, as to many important questions, and to the impending Presidential campaign and election. Each party sought advantage for the campaign. A Democratic House passed bills for which vetoes were foreseen and expected. The President and a majority of the Senate Republicans sought that which would defend their party's action and policy. An unusual complication was caused by the attitude of a minority Republican group in the Senate, hostile, as a rule, to the Administration. So it has come about that there has been no legislation concerning the tariff, the Trusts or the currency, if we except the elimination of the Tariff Board. Currency reform, suggested by the Monetary Commission, has virtually been ignored, except in a House investigation concerning what is called a Money Trust. The Stanley Steel Trust inquiry brought to light much ancient history, with somewhat novel theories as to the causes of the panic of 1907, but upon the varied recommendations of the committee no action was taken. There was no attempt to embody them in statutes. Congress might well have provided for a commission of inquiry on this subject. Such a commission would, we think, recommend the creation of a permanent executive commission, with powers of supervision and regulation. We have recently discussed the failure of attempts to revise the tariff. Both parties are now in favor of downward revision, but they cannot agree as to the fundamental doctrine with respect to which the changes should be made, or the measure of reduction. Political advantage has been gained, in our judgment, by the Democrats on account of their attempts to revise, and also by reason of the President's vetoes, altho their bills were by no means perfect, and we think Mr. Taft's course was that of a conscientious man.

The investigations by which political ammunition was sought have not been fruitful in projects of legislation, but they have tended to cause or confirm popular opposition to the party which controls the Government. Unfortunately, the President's memorable peace treaties were so affected by amendment that they have been laid aside. The objectionable practice of attaching important riders to general appropriation bills was sharply and justly disapproved by Mr. Taft, whose vetoes were effective with respect to several of them. He might reasonably have also opposed several propositions attached to the Panama canal bill. The long contest over an appropriation for more battleships ended in an unworthy compromise. Among the commendable achievements of the session may be mentioned the beginning of a parcels post (under conditions which may require modification); the creation of an industrial commission; several provisions for the safety of passengers at sea; the eight-hour law for Government work; the new Children's Bureau, and the ousting of Lorimer. The Democratic House set out to work for retrenchment and economy, but voted for a pension bill which will increase expenditures by at least $25,000,000. We pre-

sume that both parties hoped to gain political advantage by that measure.

An examination of the record of the session does not disclose much which will be distinctly and continuously of service to the people. Omissions or failures tend to obscure that which was accomplished. But at the end the President and both parties united in the support of a bill which he should have vetoed and which never should have been sent to him for his signature. The session will be remembered at home and abroad, we think, mainly in connection with its unfortunate action concerning this bill relating to the Panama Canal.

The Ravishing of the Socialist Party

THE public has been interested the past week in the complaint made by William J. Ghent, secretary of Congressman Berger, and himself one of the ablest writers on American socialism, and a not infrequent valued contributor to THE INDEPENDENT, that Mr. Roosevelt in his party platform has been guilty of gross felony in stealing a multitude of planks from the Socialist party's platform. He thus complains:

"The new party, which goes boldly forth to its first campaign with the inscription on its banners, 'Thou shalt not steal,' begins its career with the brazen theft of half the working program of the Socialist party. . . . After all his swashbuckling and rant against the Socialists Mr. Roosevelt is obliged to accept the main points in the Socialist indictment against capitalist society."

These "main points" that leave the Socialist platform ravished and ravaged Mr. Ghent finds to be no less than eighteen, and he sets them out in deadly parallels, column against column, to prove the theft, which he again thus describes:

"With scissors and paste pot and a copy of the Socialist platform, Roosevelt started in on the task of presenting the American people with a catalog of the evils which beset them, and of the remedies which are necessary."

So Roosevelt is made the robber, the Ahab who steals the poor Debs's vineyard; or is the Socialist platform the one pet ewe lamb seized by force as in the story the prophet Nathan told to King David?

A comparison of the two platforms leaves little room for doubt that the makers of the Progressive platform had carefully studied the Socialist platform, and found it a useful mine to dig from, but what of it? Has the Socialist party an exclusive patent on social wrongs? Is not one of the Socialist planks, "The abolition of the monopoly ownership of patents and the substitution of collective ownership"? A Socialist platform should be common property, good for anybody to take and use. Besides, how came the Socialist party by the exclusive right of ownership in these public grievances? We have heard of them, or most of them, these many years. One of them is "initiative, referendum and recall"; but socialism did not lend that to Oregon. Any party had a right to it. Another is "the conservation and development of natural resources"; surely Mr. Roosevelt has the right to that slogan, and we are not sure but the Socialist party is the thief. The "inspection of workshops and factories" is common property, an old demand; and so are the restriction of child labor, the abolition of prison contract labor, the graduated income tax and inheritance tax, already in operation, and many others. Think of the assurance which complains in behalf of socialism that the Roosevelt party has stolen the woman suffrage plank from the Socialist platform! Were Lucy Stone and Elizabeth Cady Stanton and Susan B. Anthony laboring in such secrecy, or so long bygone that socialism imagines that it has originated the demand for equal suffrage, and that it should berate Roosevelt as if he had stolen that old lumber from its platform?

The fact is that when Roosevelt was using the fine comb in search for grievances which he could promise that his new party would remove, it was his business to search every encyclopedia that he might miss none, and of course the Socialist platform was one of the best. We doubt not he read it carefully and made memoranda. The one most important proposal, and as nearly new as any, that for "a more easy and expeditious method of amending the Federal Constitution," was very likely taken from the Socialist platform; and the expression, "the conservation of human resources," is copied verbally, a curious phrase

brought over unwittingly from a memorandum. But this is not enough to base a charge of plagiarism upon.

The fact is that Socialists ought to rejoice if they see that reforms they favor are taken up by other people. Is not socialism generous? If it imagines all these eighteen desired reforms are its own discovery, that is no reason why it should selfishly keep them in its own special preserve. Socialism claims to be a sort of religion, or substitute therefor; and socialism should be happy when its goods are taken. We have observed that when Hinduism, in the form of the Brahma Somaj or the Adya Somaj, puts on a Christian cloak and discards old superstitions and cruelties, or when a Mohammedan reformer starts a new sect which talks only of love and peace, then Christian teachers rejoice, as they ought to. They do not call it theft; they do not cry out: "Thou shalt not steal." They may wish that more was confessedly made of Christ, but what Chunder Sen or the Bab accepts, borrows, adopts, absorbs, is so good that they are glad. To be sure, Mr. Roosevelt is not a Socialist; he has not accepted "the collective ownership and democratic management of the social means of production for the common good"; but the present practical reforms which socialism is now ready for he does accept, and a Socialist's heart ought to rejoice. Debs and Berger and Ghent ought to cry out: "Almost we have persuaded him to be a Socialist, and he does not know it!"

Stealing is a bad thing. That form of stealing called plagiarism is a bad thing. But all borrowing of ideas is not stealing. Let us tell a story of plagiarism which has never appeared in print. Some thirty years ago that most honored missionary to Syria, Dr. Van Dyck, translator with Dr. Eli Smith of the Arabic Bible, was still living in Beirût. The report came to us that he had been guilty of plagiarizing in a sermon preached in the chapel of the Syrian Protestant College. The report seemed incredible; but, so the story went, one of the teachers on going home found the sermon in a magazine. Even in such narrow missionary and educational coteries there may be jealousies and suspicions. Perhaps there were in Beirût. At that time the chapters of Henry Drummond's "Natural Law in the Spiritual World" were appearing in a magazine, and it was charged that he had plagiarized one of them in his sermon. We could not believe it and we asked: Was it a written sermon or extemporaneous?" It was extemporaneous. The next question was: "Did he preach it in English or in Arabic?" In Arabic. The plagiarism quite escaped in thin air. He had read the chapter and it had fructified in his mind and he had made it the subject of a sermon. Ideas once published become common property; the words are the author's. If Mr. Roosevelt, or the writers of his platform, had copied *verbatim* the Socialist plank on woman's suffrage it might have been retorted to him: "Thou shalt not steal." But the subject itself was public property, and the fact that the Socialist platform had annexed it was no reason why he should not do the same.

A Woman Who Did

The American papers last week chronicled the death of Miss Octavia Hill at the age of seventy-four, but few of those who read the brief announcement realized that the world owes largely to her the inception of one of the most important movements of our time, the movement for better homes and outdoor opportunities for the city poor. What others deplored she remedied. While others theorized she demonstrated. When young she became interested in the work for the poor of London under Frederick Denison Maurice, leader of the Broad Church party and founder of the Workingmen's College. Here she became convinced that the question of the tenement must be solved before efforts to elevate the masses can hope to succeed. In order to gain experience she bought up some dilapidated houses near her own home in Marylebone, borrowing for the purpose $15,000 from John Ruskin, which she afterward repaid from the profits of the enterprise. Miss Hill collected her own rents and she did it efficiently, giving notice to quit whenever the money was not ready on her weekly call, for she realized the lesson most needed by such people as her tenants was punctuality and scrupulousness in meeting obligations. A

writer in the London *Times* thus describes her methods:

"She had a few improvements done at once —tho, for the most part, these were done only gradually, as the people became more capable of valuing them. Then she paid the elder girls to scrub regularly and preserve as models of cleanliness the stairs and passages for which the landlady was responsible, with the result that the girls acquired cleanly habits, and the lesson taught by the stairs soon spread to the rooms. In the same way the tenants, when out of work, were employed to do repairs to the premises, so that 'little by little the houses were renovated, the grates reset, the holes in the floor were repaired, the cracking, dirty plaster replaced by a clean, smooth surface, the heaps of rubbish removed,' and a general progress made toward order. There was, too, a corresponding moral improvement in the people, and tho the new landlady never unduly interfered, never entered a room unless invited, and never offered any gift of money or necessaries of life, she came to be regarded as the best friend of the tenants, and not only 'got hold of their hearts,' but was often able to help at some important crisis or other in their lives."

There was no taint of charity about the scheme, altho the tenants were getting two rooms for what they previously had paid for one. Miss Hill obtained 5 per cent. on the capital invested, and with these profits and funds obtained from other philanthropists she bought other tenements, each time of a more unpromising character, until she had proved that even in the worst slums decent accommodations could be made to pay.

This was but one side of her activity, for she saw that it was not enough to provide good housing; there must be opportunity for outdoor life as well. But when she had cleaned up a vacant lot near her block of tenements for a playground she discovered that the children did not know how to play. So she organized a fife and drum corps among the boys and induced her lady friends to come and teach the children games. Then she turned her attention to the larger playgrounds of the public, the parks. Hampstead Heath, the most popular of London's open spaces, was by her efforts saved and doubled in size by an expenditure of $1,500,000 obtained from private donations and municipal appropriations, and she took part in the national movement for the opening of public gardens and the preservation of places of historic interest. Nowadays everybody realizes the possibility of cheap and decent houses and the profitability of breathing spaces in a city, but it required constructive genius of a high order to lead the way. Miss Hill was noted for her businesslike habits, common sense and strict reliability in all financial matters. We mention these because they are qualities not always to be found in reformers.

Miss Hill's work was a womanly work, for if housing, and home life, and sanitation, and charity, and children's play, and the cultivation of an appreciation of scenic beauty do not come within woman's sphere, that sphere has been strangely narrowed in the course of centuries. But in order that she might accomplish this work, in order that the public might have the advantage of her unique ability, it was necessary for her to enter public life and take official positions, to a greater extent than many people in this country would think proper. It is comparatively rare in this country for women to be appointed on municipal and national boards and commissions, as was Miss Hill. It may be that executive ability such as hers is more common in the sex than is generally supposed. At any rate, we Americans are wasteful in failing to utilize what there be of it in the public service. It is easier in the United States to secure votes for all women, qualified and unqualified, than it is to get an opportunity for exceptionally qualified women to do something for the common weal. On the other hand, there are many more women clamoring for additional political privileges on the ground of sex than there are willing to use what opportunities they now have to demonstrate their usefulness. The best of all arguments for the suffrage and for what is more important, administrative work is not to claim that women are injured by being refused their rights, but to prove that society is injured by their deprivation.

The Length of a Sermon

We hear many complaints nowadays of the length of the sermon, not so often as formerly complaints form the auditors that it is too long, but more commonly complaints from the preachers that they are not allowed time enough. Now, we are personally inclined to sym-

pathize with the preachers. Thirty minutes is not long to listen to a man who is worth listening to at all, and if the sermon is cut down to twenty-five or even twenty minutes, as it sometimes is, by the "enrichment" of the service, it means that the Church has gradually relinquished one of its most important functions, that of instruction, guidance and inspiration. What is more, the minister often thinks that he must dilute his sermon as well as give short measure in order to satisfy his patrons, and for such half pints of milk-and-water mixtures as are now sometimes served to us we have no use whatsoever.

But having said this on their side of the case, we wish to call the attention of the clergy to the fact that the demand for brevity does not affect them alone, and is not motivated by anti-clerical bias. It may afford them consolation—perhaps, indeed, delight—to realize how much worse off the rest of us are. The editor has the same desire as the preacher to persuade people to his way of thinking and to induce them to act accordingly. The themes he discusses are sometimes the same and often quite as serious as those of the preacher. But the editor is much more modest in his demands for time. This is undoubtedly one reason why he attains a larger audience. If the preacher has a half hour at his disposal, and talks at the rate of 150 words a minute, an ordinary speed, he delivers about 4,500 words. Now, the editor of the New York *World* says his say on any subject, however important, in 280 words on the average. The editor of the New York *Times* is more long winded; he runs to about 350 words. But these are dailies, you say. Well, we turn to the *Saturday Evening Post* and find that the average length of the editorials is about 270 words. And some four or five million people read them or have the opportunity of reading them. Since one reads at a rate about twice as fast as the delivery of a public speaker, this means that the preacher, altho he may be limited to a half hour, still claims the attention of his congregation for a period thirty times as long as that the editor asks of his readers. The editor of a yellow journal whose salary exceeds that of a hundred ministers, manages to express his opinion with sufficient force with less than a tenth the number of words than this average sermon, and shorter words, too. Dr. Parkhurst, when he passes from the sanctuary to the sanctum of a Hearst paper, cuts off nineteen-twentieths of his time and reaches two thousand times as many.

We of THE INDEPENDENT are not so modest as some of our confreres. We sometimes demand as much as five minutes of the reader's time for an editorial when it is a question involving the fate of the nation. We are still more generous to our contributors, but if we receive an article requiring more time to read than half the duration of an ordinary sermon we look at it with antipathetic prejudice in our eye, even tho it presents the results of a year of study by one of the foremost authorities. We have a well grounded suspicion that if we do not reject it on account of its length our readers will. There are few manuscripts that come to us which would not be improved by the application of the old puzzle rule, behead and curtail and you get something better.

So, after all, the plight of the preacher is not so bad as he makes out. He has had to boil it down and he may have to boil it down still more in the future, but not so much as others have to. A few words spoken are more impressive than many words printed, so if the preacher were cut down to one-minute sermons he would still have the advantage of the editor. And the editor is not complaining.

The Tropics Made Livable

PROBABLY nothing is more interesting in the story of recent medical developments than the change of attitude that has come with regard to tropical diseases. The tropics a generation ago were considered to be regions in which, because of insuperable climatic conditions, it was almost hopeless to expect that white men would ever be able to live with any safety or good health, much less be able to accomplish effective work. It is true that some especially healthy individuals seemed to be able to acquire an immunity to many of the tropical diseases and to be able to live in

these regions. Even these, however, were likely to suffer severely and their lives were shortened and they did not always transmit their immunity to others. Apparently only races with very specially developed powers of immunity, selected by nature thru many generations, might be expected to live happily and successfully in the tropical countries. These were all members of the colored races, in whom long exposure to the sun had produced a pigmentation that protected them from the worst effects of the sun's rays and whose skulls had often been thickened as the result of similar irritation acting upon the bony structures, tho at the expense of space for brain tissues within the cranial cavity. The outlook for the white race in the tropics was most discouraging. Indeed there were many good authorities who declared that white occupation of the tropics continuously must be considered almost impossible.

Now all that has been changed and there is no doubt at all that the definite conquest of the tropics by the white man has been achieved. It has been almost entirely a matter of discovering that the so-called tropical diseases which were thought to be conveyed by the air and to be inherent, as it were, in the climatic conditions are really distributed by various insect parasites. Just as soon as these can be controlled the supposedly inevitable diseases are very much limited or are entirely eradicated. It is less than twenty years ago since Doctor, now Sir, Patrick Manson brought to general attention the idea that malaria, which represented the worst of the tropical diseases and under whose name many affections since come to be recognized as of quite different character masqueraded, was probably carried to the inhabitants of various districts by mosquitos. Dr. Carlos Finlay, of Cuba, had insisted on this same idea for yellow fever, but his investigations and articles, tho they now show that he had completely anticipated many recently accepted notions, attracted very little attention. Men could not be brought to think that so destructive an epidemic disease as yellow fever could be due to so comparatively trifling an agent as the mosquito.

After Dr. Ronald Ross's demonstration of the agency of the mosquito in the distribution of malaria the whole aspect of the question of tropical diseases was revolutionized. The eyes of medical investigators were opened to the possibilities of disease distribution by the luxuriant insect parasites of the tropical regions. The demonstration that yellow fever was conveyed by the mosquito came as the result of the labors of the United States Marine Hospital Service in Cuba just at the beginning of the present century, and nearly every year since has seen the discovery of the connection of some tropical disease with a definite parasite. The fatal sleeping sickness of Africa is spread by the tsetse fly, tho probably other insect parasites may be capable of carrying it. We had known for many years that the bite of the tsetse fly was serious for man, was often fatal for animals, but its production of a specific disease had not been even guessed at. Then came the extremely important discovery that plague, by which is meant bubonic plague or pest, probably the worst epidemic disease of the world's history, is conveyed by means of fleas, and especially those fleas that live on the family of rodents, our familiar rats and mice. It became very easy to understand after that discovery how the disease is so readily and widely diffused, tho before that the only explanation possible seems to be that conveyance must be thru the air and prophylaxis seemed almost impossible.

One after another serious disease of various kinds in tropical regions yielded up their secrets to this new lead for investigators. In 1904 it was shown by Leishman and Donovan that the so-called dum dum fever, a chronic and usually fatal disease, associated with great enlargement of the spleen, which had been supposed to be malarial in origin, was due to a parasite quite different from that of the malarial organism and one that was carried very probably not by the anopheles mosquito, which carries malaria, but by some other insect parasite. The disease is often called kala azar in India, and has given great trouble. There is an external or local form of it known by various names in different parts of the country, as Delhi boil, Sindh sore or the Oriental sore,

etc. A third variety of the disease has been found on the shores of the Mediterranean, affecting chiefly children, and giving rise to what is known as infantile kala azar, and this form has been shown to exist also in dogs, and to be conveyed from dogs to human beings by means of the dog flea. The exact mode of distribution of the three forms is not yet known, but the secret seems now about to be revealed.

It might very readily be thought that all this was mainly theoretic, or impractical, at least. But by following the lines of prophylaxis suggested by these discoveries men have actually been able to make portions of the tropics not only habitable, but absolutely healthful, for the white race. Panama has been known for generations as "the pest hole of the tropics," and when the French failed to build the canal the French medical profession excused them on the score that probably this portion of the earth was the worst plague spot of the globe—the most unhealthy region that we knew of, probably always to be extremely dangerous, if not quite impossible as the habitation of white people. Now as the result of following out practically the discoveries of Dr. Ronald Ross with regard to malaria, and of our own Drs. Reed and Carroll with regard to yellow fever, Panama has become a rather healthy place to live in. The mosquitos of the regions have been brought under control, care has been taken to prevent the recurrence of stagnant water in which mosquitos might breed, and cases of malaria and yellow fever have been protected from the approach of mosquitos until these two diseases have become almost negligible factors in the death rate of the Canal Zone. The death rate in the region is less now than that of many even of our Northern cities and of nearly all of our Southern cities.

As a consequence of this the plague spot of the tropics has become almost a health resort. Not long since the Imperial Legislative Council of India decided to send an Indian medical officer to Panama in order to study the methods that had been so successfully employed there by the United States Government for the prevention of tropical diseases. It is extremely interesting to realize that the English have been in India for some 200 years and that the United States have been in Panama less than ten years, and that the British Indian officials are sensible enough to realize that they can learn lessons for the benefit of their people by sending an official to study what the United States has accomplished. We have absolutely demonstrated there that the control of tropical diseases is only a question of the application of recent knowledge and that the habitation of the tropics by the white man is not only possible, but may be made quite healthful. Not only can he live and be healthy, but with proper care his efficiency need be but little impaired and he can accomplish the important engineering work that is so readily executed in cooler climates without any very serious risk.

Progress in Direct Legislation

A GENERATION has passed away since the agitation for direct legislation by the people was commenced. Particularly in the matter of the initiative and referendum the movement has now continued long enough to enable an estimate to be made of the steadfastness of the popular demand, if not of the inherent value of the method. Nevertheless, it is a customary thing for eminent men and important newspapers to assume an attitude of contempt toward the whole movement by affecting to regard it as the temporary aberration of a hysterical populace. The facts do not justify that attitude.

Under amendments varying widely in terms, ten States now have the initiative and referendum. These are: South Dakota (1898), Oregon (1902), Montana (1906), Oklahoma (1907), Maine (1908), Missouri (1908), Arkansas (1910), Colorado (1910), Arizona (1911), and California (1911). Two States have the referendum only: Nevada (1905) and New Mexico (1911). Utah established the principle of initiative and referendum in 1900, but no practical results have followed, because successive legislatures have steadily refused to enact details to be "provided by law." Michigan (1908) has a constitutional initiative only.

Further demonstrating the insistent

popular desire for direct power over legislation, the people of seven States will vote in 1912 on amendments providing more or less liberal opportunity for the direct expression of popular opinion. These are Washington, Nebraska, Idaho, Wyoming, Mississippi and Ohio, and for the initiative only in Nevada. In Wisconsin and North Dakota a vote will be taken in 1914 conditional upon indorsement of proposed amendments by the legislatures of 1913. In five States proposed amendments for submission of the initiative and referendum received majorities in both houses of the Legislature, but lacked a constitutional majority in one house, namely, Kansas, Massachusetts, Illinois, Minnesota and Michigan.

The rapid spread of the commission form for the government of municipalities has been a factor in extending the initiative and referendum as political instrumentalities among local constituencies. More than two hundred cities in twenty-five States have adopted it as parts of their charters. About one-third of this number have also adopted the recall.

Altho it is shown by the foregoing tabulation that the principle involved in the use of the initiative and referendum has received widespread recognition, it should not be supposed that the detailed provisions giving effect to the constitutional amendments by which they have been established are in all cases, or even in a majority of cases, such as would give them a fair trial upon their merits. Reluctant legislatures, largely composed of men whose motives for opposition to any extensions of direct power to the people are not such as they would care to publicly acknowledge, and sustained in that opposition by influences that would rather "do business" with a compact body of pliable "representatives" than trust to the electorate, have so "safeguarded" the application of the initiative and referendum as sometimes to make them practically useless and frequently to deprive them of much of their effectiveness. Among the devices resorted to for the accomplishment of this purpose are limitations of the initiative to statute laws (prohibiting amendments to State constitutions); the requirement of improbable majorities to secure the enactment of measures popularly initiated or the rejection of laws passed by the legislature and submitted to the referendum; the requirement of large petitions or the imposition of conditions that make any petitions difficult of procurement; the framing of "emergency clauses" that enable the legislatures to annul the right of an appeal to the referendum; arbitrary limits upon the number of amendments that may be submitted at one election; failure to provide an adequate and efficient method of informing voters upon the merits of propositions submitted. By any or all of these means the "teeth are drawn" out of initiative and referendum amendments when popular demand has reached a point where "something must be done." Then laws are passed which pretend compliance with the popular wishes, ingeniously framed to make the act useless or worse for its ostensible purpose, and also enable opponents of the movement to discredit its workings and hold them up as "horrible examples."

But it is highly significant that no State which has enacted an initiative and referendum amendment, no matter how imperfect or how deliberately inefficient, has ever taken a backward step and repealed it. And it is equally significant that in all States where such amendments have been passed, no matter what the character of the obstacles placed in the way of their effective use, there is a slow but irresistible movement toward the elimination of "jokers" and the improvement of the acts.

The theory underlying the use of the initiative and referendum, that the people should have a veto power upon measures which they regard as inimical to their welfare, and the right to initiate legislation when legislatures ignore their wishes, seems to us essential as a check upon the misrepresentation of which we see daily examples in our lawmaking bodies. We may admit that experience has not yet demonstrated completely what success will attend the exercise of such powers by the people, altho we assert that the more freely they have been exercised the more commendable have been their results. But we say that the facts here given prove beyond con-

troversy that the tendency of the times is to make the experiment, and that the virility of the movement in favor of direct legislation has been absolutely demonstrated by the fight which has already been made upon it. It will live and go on because it has proved its right to do so.

Preserving Wild Life

In the streets of big cities it is now common to establish what are called "isles of safety" for pedestrians as a refuge and protection against motor cars and other vehicles, but so far, with but few exceptions, man has not provided such places of safety for the birds and animals of the forest. Heretofore, until recently, there has been no serious need for such protection, but the preservation of birds and certain species of animals has now become a matter of urgency if many species are not to become extinct.

Many States and some public-spirited citizens and such organizations as the Audubon Society have now begun a movement for the preservation of bird and animal life, and the movement is a timely one. It is estimated that fully 90 per cent. of the wild birds and animals of the North American continent have been destroyed since the coming of the white man, whose advance leveled the forests and cultivated the waste places once the habitat of animals and birds, while to the constantly diminishing remainder the gun and snares of the hunter offer a constant menace. In this way the wild buffalo has practically disappeared, the egret and heron have become almost extinct, and even the canvasback duck and mallard are yearly becoming scarcer in haunts where they once existed in great numbers. Had birds been slain for food alone there might be some justification for this slaughter, but game birds have fared even better than those which are hunted for their brilliant plumage. Had it not been for the efforts of the Audubon Society the latter class of birds, already small in number, would now be extinct.

As a matter of contrast it is interesting to note what ravages man has made among the birds during the past century. The ornithologist Wilson, a century ago, estimated there were more than 2,230,270,000 passenger pigeons in one flock he saw. So great, sometimes, was the number of these pigeons in their migratory flights that branches of trees on which they rested at night were frequently broken off by their weight.

John James Audubon estimated that there were in one flock he observed in Kentucky 1,115,036,000 pigeons, and says of another he visited at their roosting place in the same State that "many trees two feet in diameter I observed were broken at no great distance from the ground, and the branches of many of the largest and tallest so much so that the desolation already exhibited equaled that performed by a furious tornado. . . . The pigeons, coming in by millions, alighted everywhere one on the top of another, until masses of them resembling hanging swarms of bees as large as hogsheads were found on every tree in all directions. These heavy clusters were seen to give way, as the supporting branches, breaking down with a crash, came to the ground, killing hundreds of those which obstructed their fall, forcing down other equally large and heavy groups, and rendering the whole a scene of uproar and of distressing confusion."

Now the passenger pigeon is rarely seen and in many States probably never shows itself. As late as 1888 wild pigeons were to be found in great numbers in Northern Michigan, where they were slaughtered by thousands. Where have the remainder gone? Some say to South America, but at any rate their migrations over the Atlantic States have long ceased and many Americans of today probably never saw a wild pigeon. A few years ago $400 was offered for a nesting pair, but it probably was never demanded by a fortunate possessor of a pair of birds that formerly migrated in billions over the United States to the northward.

From the point of view of food alone the preservation of game birds has become a matter of national interest, while every lover of nature regrets the passing of song birds and those of beautiful plumage. Happily, many States and public-spirited men and societies are now aiding in stopping this ruthless slaughter of birds and wild animals. A citizen of Louisiana, for instance, has

just purchased Marsh Island, off the coast of that State, for a bird asylum. The island, containing 74,000 acres, will be added to 13,000 acres deeded to the State some time ago, to be forever maintained as a refuge for migratory game birds. The United States Government and also the Canadian Government have taken effective measures for the preservation of wild life in the establishment of vast forest reservations, which will also be game preserves. The Nepigon forest reservation, in Canada, for instance, includes an area of some 4,000,000 acres, and these, as well as the great reservations in the United States in the Rocky Mountain region and State reservations in the Appalachians and elsewhere, will be maintained chiefly on account of their forests and their value as influences upon rain and weather conditions; but they will also constitute asylums for the animal and bird life of the continent. A movement is on foot to get Mexico to join in the effort, and there is good reason to believe it will gladly cooperate in creating similar reservations. The movement is a timely one and will commend itself to all lovers of birds and wild animals.

The Work of General Booth

The death of General Booth draws our attention fairly to the astonishing success of the simple-hearted and straightforward effort of a single man to better the conditions of human life. It is hardly half a century since his appeal to Parliament for assistance in abolishing poverty. He was made the subject of sneers, and his dream was considered nothing more than a dream. It was at that time a universal belief, inside and outside of the churches, that poverty was a natural social condition from which many would never escape. General Booth lived to revolutionize the sentiment of the world. We are now struggling, not so much to save a few for another world, as to put this world on a sound basis of social harmony and fellowship. He lived long enough to see astounding progress toward the realization of his dream. Perhaps the grandest of his work was the colonizing scheme, which is now being supervised by the Salvation Army in South Africa and in Australia, as well as in England, and we are happy to say in America also. In all of the English colonies large grants of land and annual grants of money have been made. In Rhodesia three thousand acres have been turned over to the army, and two similar tracts in Zululand; while Western Australia has contributed twenty thousand acres for the purpose. The latest reports from these colonies is that they are lifting fallen humanity successfully. The colonists are all healthy, and most of them happy, with wholesome food and conditions of betterment. General Booth fortunately did not leave the movement to fall into the hands of promoters and speculators. He began with the proposition that a colony to be successful must be complete and work on the basis of the family rather than the individual. "No success in colonizing can be looked for unless on a large scale, sufficiently large to make the settlement interesting and lively." Nor must there be any effort at political or religious conformity. This movement of General Booth was held by him to be his grandest contribution to human welfare. We can do nothing better than to take it up in honor of the great Christian statesman and make it fulfill what he intended, and to such a large degree tested and proved.

The Romance of Words

A Frenchman, M. Albert Dauzat, has written:

> "The words of a language are born, develop, waste away and die. They reproduce themselves, also; leaving behind them a frequently numerous descendance of derivatives and composites. Finally, they experience and practise the struggle for existence."

To write thus is to apply the "biologic method" with a vengeance. Yet the statement is not strained. An English scholar, Mr. Ernest Weekley, in writing the preface to his new book, "The Romance of Words," is convinced "that there are still . . . many people who are capable of getting intellectual pleasure from word-history." For words that have their romance are almost human, and nothing is more false than the notion that philology need be cut and dried. Take *sabotage*, for example. We have all encountered this French expression in discussions of labor warfare. It

means, in general, the destruction or damage of machinery or product by workers who do not go out on strike, but use a more direct action. How many who know all this can tell the history of the word? It is a derivative of *saboter,* to "scamp work." The substantive *sabot,* a wooden shoe, has, it seems, a secondary meaning in popular usage: any kind of second-rate article. Hence *saboter.* Hence *sabotage.* An eloquent origin—yet nowise surprising to those who remember the Second Commoner's speech in Shakespeare's "Julius Cæsar": "Truly, sir, in respect of a fine workman, I am but, as you would say, a cobbler."

Co-operation of Theological Colleges

The four Protestant theological colleges of Montreal, namely, Congregational, Diocesan, Presbyterian and Wesleyan, have agreed upon a plan of co-operation with each other and affiliation with McGill University, in order to prevent unnecessary duplication of lectures. It is proposed to erect a neutral building near the university to accommodate the courses given in common and a well equipt library. The first calendar just issued lists a combined faculty of sixteen giving thirty-six courses, besides the secular subjects taught in the university. The individual colleges will teach denominational history and polity in their own way, and prescribe such requirements as they please for their degrees. This action is significant of a very general and important change in educational methods, the tendency of divinity schools to draw nearer together and nearer to the great universities. Formerly the medical and law schools were mostly separate and proprietary; now they are finding it desirable to affiliate with universities in order to maintain their standards and increase their efficiency. The theological schools, however, have held aloof from the merger movement, and in the United States most of them are still unconnected with other institutions and are often isolated by location. But recently it has become recognized that this must be changed if the candidates for the ministry are to have the advantage of the best educational opportunities of our time, and in many ways steps are being taken to overcome the disabilities of division. In California, a group of theological schools have gathered about the State University in Berkeley, as they are gathering about McGill in Montreal. In Michigan the student pastors, Y. M. C. A. secretaries, and professors in the State University join together to provide the "Ann Arbor School of Religion," with an excellent curriculum. Andover Theological Seminary has moved to Harvard; Union Theological Seminary has put up a magnificent building just across Broadway from Columbia University, and the students of both institutions have the advantages of the libraries and lectures of both. In England, theological schools of various sects have affiliated with the municipal universities of London and Manchester. In every great university many courses are given that it is unnecessary to duplicate and some that it is impossible to duplicate in the theological schools; courses in the languages, modern, classical, Semitic or Oriental; courses in history, economics, sociology, charity organization, criminology, psychology and philosophy. On the other hand, the university will benefit by the presence of professors and students to whom religion is the main thing in life.

Clickety-Clack

A few years ago an American engineer put up an immense concrete building on the island of Jamaica in record time. In explaining his methods of increasing the efficiency of the natives, he told how a wire got loose on a wheelbarrow and rubbed against the spokes of the wheel. The native chauffeur noticed the clickety-clack and with unusual intelligence observed that the faster he ran the better was the music, so he kept up a lively pace. After investigating the cause for the unusual speed of this particular native, the engineer caused all the wheelbarrows on the job to be fitted with a "clickety," giving the result first noted above. A German inventor now proposes to wake up locomotive engineers by means of a "clickety." Every traveler is familiar with the tedious clickety-clack, clickety-clack of the railroad train, caused by the car wheels passing over the joints of the rails. The rail sections

being all of standard length, the noise is quite regular when the train is traveling at a constant speed. The German believes that for a short distance before approaching a signal tower the rails should be made either shorter or longer so as to change the rhythm of the click-ety-clack and thus call the attention of the engineer to the nearness of the signal. Perhaps a skilled musician of a practical turn of mind might fix it so that the warning would be given of the approach to the signal, and if the signal is set the train would play a dirge as it goes on beyond at full speed.

The Humor of Government

The Germans, in their government of Alsace-Lorraine have, ever since 1870, proved themselves as brutal and unhumorous as any governing power could be, and in nothing is this shown more clearly than in their prosecutions of cartoonists and writers. The latest newspaper to risk condign punishment is the *Gazette du Rhin et de Westphalie,* which published, not long ago, several satirical articles directed at the pangermanists and special police. One of these gives examples of alleged "denunciations" of Alsatians suspected of French sympathies:

"At the *A* pastry-shop, the customers are welcomed with the words, 'Goodday, madame.'—The manager of the *B* factory celebrated July 14 at Nancy.—In the *C* cook-shop the accounts and correspondence are conducted in French.—The daughter of lawyer *D* is engaged to a French captain.—*E,* notary, has bought a phonographic record of 'The Marseillaise.'—The wife of banker *F* gets her hats from Paris.—The *G* Society gave on Saturday a theatrical performance in which a French soldier in uniform figured.—The children of butcher *H* wear blue, white and red stockings.—On the window of watchmaker *K* is the inscription: 'French Spoken Here.'—*L,* merchant, has imported a case of Bordeaux wine."

This is only a part of the document—but it is enough. And now the German authorities talk of legal proceedings! One reason why Prussian methods seem to have failed in Alsace-Lorraine, while the English have succeeded in making French Canada happy and prosperous and loyal, is precisely that the one power has winked, while the other has spied. And there *is* such a thing as a British sense of humor, otherwise, where did we Americans find ours? We surely did not borrow it from our Indian aborigines; for the sense of humor is a civilized trait—which explains why it is so wanting among Prussian bureaucrats.

The French are a practical people, less hampered by tradition in some respects than we are. That is why they so often get ahead of the rest of the world. Just now they are trying to get rid of the awkward way of dividing the circle, which we inherited from the Babylonians. The new tables of the Geographic Service of the army are based on the decimal system, each quadrant being divided into 100 parts instead of 90. This greatly simplifies the use of trigonometrical functions and reduces the liability to error.

What we cannot understand is why people can complain about the increased cost of living when almost every store window we pass is filled with goods marked down from former prices.

The way to enjoy life, the only way, is to enjoy each moment of it at the time. If you are shaving, enjoy that. If you are combing your hair, enjoy that. For life is equal to the sum of its parts.

Fashionable society is occuped in continually searching for the bizarre and continually converting it into the commonplace.

When a woman wants a vacation she shifts the furniture about and does up her hair in a different way.

There are those who think that the only way to preserve the language is by making a mummy of it.

"It commends itself to my reason" may generally be interpreted as "It agrees with my taste."

"Heaven lies about us in our infancy." The world does it for the rest of our life.

Did you ever read about a heroine you would like to marry?

Josh Billings said: "Things is mixt." He was a philosopher.

INSURANCE

Retirement of the Empire State

THE announcement is made that the Empire State Surety Company, a Brooklyn organization, will reinsure its outstanding risks and retire from business. Several months ago the controlling interest in the capital stock of this company was acquired by parties interested in one of the leading surety companies of the country and they, upon assuming the responsibilities of management, invited the examining departments of the State and national governments to make a thoro investigation of the financial condition of the Empire State. These examinations have been completed and the results are so unsatisfactory as to cause the board of directors to retire it.

The sworn statement of the company as of September 30, 1911, showed a surplus of $115,592, while the result of the examination just concluded places the impairment of the capital at $99,873, a difference of $215,465. It is to be noted, too, that the surplus of $115,592 was calculated on a capital stock of $500,000, while the impairment just found is against a capital of only $250,000, the original capital of a half million having been cut in half between the time of the two examinations.

According to the September, 1911, statement, the total liabilities for claims was $180,207, while according to the June, 1912, examination figures, that item appears at $426,483.

When the new management assumed control late last February it determined to make a searching investigation of the company's internal condition, and was not long in coming to the conclusion that the reserves maintained were clearly inadequate, the increased liabilities thus found fully wiping out the apparent surplus. . The directors finally decided that further attempts at rescuing the company from its difficulties were useless and that the best interests of stockholders and policyholders demanded that the business be reinsured and the company placed in liquidation. The directors announce that by reinsuring the outstanding risks in the National Surety Company—that is, selling them—a sum can be obtained sufficiently large to make good the impairment of the capital and provide enough money to pay all possible pending claims.

"Miscellaneous" Companies

PART III of the annual report of the New York Insurance Department, covering the 1911 business of all the insurance companies other than fire and life (*i. e.*, casualty, fidelity and surety, credit, real estate title and mortgage guarantee companies), and showing their financial condition on December 31 last, was made public late last week by Superintendent Emmet. Last April, for the convenience of the public, the department, following its usual custom, issued a preliminary report on this section of the business, in which the tabulated statistics were presented as compiled from the sworn reports made by the companies. Since that time the assets have been appraised by the department's experts, and the valuation of bonds and stocks placed on a uniform basis; the auditing of valuations has also resulted in various changes.

A general summary of the report is shown by a comparison of the results of the business at the end, respectively, of the years 1910 and 1911. In the section embracing casualty, fidelity and surety, and credit companies, we find the following changes from 1910 to 1911: The number of companies has increased from 54 to 60; the total assets from $129,387,972 to $145,068,249; the reserves for unpaid losses from $22,058,028 to $23,778,932; the unearned premium reserve from $38,897,480 to $42,939,625; all other liabilities from $7,738,248 to $8,888,429; the total liabilities (except capital) from $68,693,756 to $75,606,986; the capital stock from $28,669,000 to $33,777,220; and the surplus from $32,025,216 to $35,684,043.

In the matter of business transacted by these companies, the premiums have increased from $85,382,910 to $93,972,996; total income from $92,301,707 to $106,226,072; claims paid from $30,900,595 to $37,180,214; dividends to stockholders decreased from $4,086,410 to $3,398,058; expenses increased from $46,903,819 to $53,598,599; total disbursements from $81,890,824 to $94,176,871.

FINANCIAL

Crops Here and Abroad

RUSSIA'S crops are above the average. In Germany the wheat yield is reduced, but the yield of rye, the chief bread crop, is the largest ever known, and there are increases for oats and barley. Canada's winter wheat acreage has fallen from 1,172,119 to 781,000, but there is a slight increase of the spring wheat area (which is about eight times the area of winter wheat), and the entire crop is estimated at 187,927,000 bushels, against 215,831,000 last year. Canada's crop of oats shows a decrease of about 8 per cent. There is a large gain in Canada's flax, the acreage having risen from 1,131,586 to 1,711,000, the addition being mainly in Saskatchewan. Wheat has suffered in England and in adjacent Continental countries from cold and wet weather. Quality has been affected. In our own country many well-informed persons expect a wheat crop of 700,000,000 bushels, altho the Government's August report indicated 680,000,000.

There is a rush of wheat shipments at Galveston, were 1,500,000 bushels have been ordered for Europe in the last few days, and eight ships are waiting for cargoes. A recent shipment of wheat there was the first from that port in three years. President Willard, of the Baltimore & Ohio, and others, predict a car shortage for crop transportation in the near future. Owners of cargo steamships are cheerful, because ocean freight rates are high and rising.

Stocks and Trade

THE stock market was dull, last week, and comparatively narrow, the business amounting to 1,919,733 shares, against 2,611,185 in the week preceding. While several industrials showed an advance there was a small net loss for a majority of the railroad issues. Money rates were higher. General trade reports continued to be favorable. We quote briefly from three authorities:

Dun's Review. With crop prospects increasingly brilliant, with the principal industries working to full normal capacity, with trade distribution continuously expanding and with business sentiment becoming daily more and more confident and buoyant, the whole situation, both in fundamental conditions and in volume of transactions, is better than it has been for years.

Bradstreet's. Expansion is the key word of the trade situation as the month draws to a close and buyers feel the seasonal spur to the laying in of supplies for fall and winter. This is of course largely predicated upon the prospect of assured or expected large crop yields and finds chief expression in the West, Northwest and Southwest, where crop certainty has, generally speaking, supplanted prediction.

Dow & Jones. It is in the air that general business is better. Every one sees it, every one feels it. In most lines of trade buying is still of the hand-to-mouth character, but in some instances there is forward buying of raw materials by manufacturers who have booked contracts far ahead. The most encouraging reports come from the metal trade.

All speak of the shortage of labor and say that little weight is given to politics. Continuing activity in the building industry is noted. It is estimated that, if premiums for early delivery be added to price advances, the cost of the metal in steel buildings and bridges is higher by $20 per ton than it was nine months ago.

....A combination has been formed by thirty-five (or about two-thirds) of the tobacco manufacturers in Sweden.

....The inheritance tax on the estate of the late Richard T. Crane, of Chicago, is $329,131, the largest ever paid in Illinois.

....In the ten years ending with 1909 the capital invested in factories in our Southern States increased by 141 per cent., to $2,883,929,000, and the value of the products by 102 per cent.

....It is shown by a recent official report that Canada's foreign trade in 1911 amounted to $828,614,120, or more by $86,000,000 than that of 1910, and that 55 per cent. of this total was trade with the United States, against 52 per cent. in 1910, and 49 per cent. in 1909. Of $98,165,443 worth of imports of iron and steel products, $81,014,029 worth came from this country, from which, also, automobiles worth $5,416,776 were imported.

The Independent

VOL. LXXIII NEW YORK, THURSDAY, SEPTEMBER 5, 1912 No. 3327

Survey of the World

National Politics

Mr. Roosevelt, Governor Marshall and others were making speeches, last week, in Vermont and Maine, where elections are soon to be held, and Governor Wilson spoke to farmers in Pennsylvania. The Governor defended the vetoed Democratic Farmers' Free List bill, attacking the tariff and telling those whom he addrest that they were unjustly taxed in the high prices of agricultural implements. Mr. Taft, he said, had represented "the trustees," and these also were in alliance with the rich bankers. Therefore the Republicans had not sought to serve the farmers by establishing agricultural credit institutions. He urged farmers to hold conferences in order that by united effort their influence might be exerted effectively. In letters and interviews he explained his attitude toward immigration. He was in favor, he said, of such liberal, unrestricted immigration as any man with common sense and with love for America could desire, but he was opposed to immigration stimulated in an unnatural way. In his history he had referred to conditions that did exist, but which have been corrected by legislation. These were abuses due mainly to steamship companies which attempted to force immigration. After a conference with the Governor, Louis D. Brandeis, of Massachusetts, urged Progressives to vote for him. They compared views about Trusts. "Both of us," said the Governor, "desire the prevention of monopoly, which is created by unregulated competition. The Sherman act should be supplemented. We want laws that will assist people in their business instead of tying them up." In New England, Governor Marshall had for his leading subjects the tariff and the Trusts. He attacked Mr. Taft's vetoes, pointed out that the number and the capitalization of Trusts had greatly increased while Mr. Roosevelt was President, and said that the effect of recent dissolution suits had been such that the defendants must be crying out "Dissolve us again." In the course of an address at Columbus, which was not political. Mr. Taft briefly defended his vetoes, saying they were in accordance with his conscience. Speaker Clark asserted in Maine that the Republicans had won in 1908 by promising to reduce the tariff, and then had increased it. Mr. Roosevelt attacked Senator Penrose and John D. Archbold, demanded a repeal of the ineffective Canadian reciprocity act, advocated the supervision and regulation of Trusts by a Federal Commission, argued in favor of woman suffrage, and promised that his new party would help the farmers in many ways. Mr. Penrose, he said, should be expelled from the Senate. In conversation he predicted that Taft would not carry more than half a dozen States. Ex-Governor Folk, of Missouri, says Roosevelt will carry five times as many as Taft. Ex-Senator Hansbrough, of North Dakota, denouncing the Harvester Trust in an open letter to Mr. Roosevelt, asks the latter whether he would make George W. Perkins chairman of his proposed Trust Commission. Mr. Bryan says Mr. Roosevelt's remedy for Trusts is socialistic and worse than the disease. Senator Borah gives notice that he will neither join the new party nor actively campaign for Taft, but will advocate Progressive principles and seek his own

re-election. John D. Long, formerly Secretary of the Navy, with whom Mr. Roosevelt served as Assistant Secretary, says he cannot vote for the latter because of the third term objection, Mr. Roosevelt's solemn promise or declaration, his unfair and selfish treatment of Mr. Taft, and his advocacy of the recall of court decisions; also because he is a "colossal boss," is actuated by a spirit of self-aggrandizement, and is using his great power of attracting public applause only to secure his return to political power. At the Michigan primaries, last week, the Roosevelt party votes were equal to 7 per cent. of the votes cast for the straight Republican ticket.

Campaign Contributions Chancellor Day, of Syracuse University, on the 28th, in a published letter, said that John D. Archbold, in 1904, just after the election, told him the story which is to be found in Mr. Archbold's recent testimony concerning the Standard Oil Company's contributions to the Republican campaign fund. On the other hand, Collector Loeb, who was Mr. Roosevelt's secretary, has corroborated many of the latter's statements as to the Harriman incident, the letters to Chairman Cortelyou, etc. Mr. Hearst questions the accuracy of Senator Penrose's testimony and gives notice that he will publish more letters. Mr. Roosevelt says Mr. Knox remarked, when the exclusion of Standard Oil money was discussed, that Mr. Frick would make good the loss. The Pennsylvania Republican Committee can find no evidence that it received the $25,000 paid to Penrose. Just before Congress adjourned, the Senate adopted a sweeping resolution providng for an inquiry as to contributions, including those received for Mr. Roosevelt's recent primary campaign. Mr. Roosevelt desired to testify promptly in answer to Penrose and Archbold, but the committee could not resume its investigation before the 30th inst., and therefore he sent to the chairman a letter of about 18,000 words. In this he earnestly defends Treasurer Bliss, who, he believes, has wrongfully been accused by Penrose and Archbold; says that if any Standard Oil money was received it was taken against his own express prohibition; quotes his letters to Cortelyou, with the latter's statements to Loeb; quotes the Parker charges and his reply; sets forth again the Harriman correspondence; says he never asked Harriman for money; says Rogers, Archbold, Sibley and Senator Bourne appealed to him in behalf of the Standard Oil Company; quotes his letters to Bourne; says that Penrose's testimony proves he is unfit to remain in the Senate, as he admitted that he gave Archbold such advice as a blackmailing police officer would give to the owner of a gambling house; warmly commends George W. Perkins; praises the poor who have contributed to his new party's fund, and ends with a statement of the party's and his own aims.

Labor Questions William M. Wood, president of the American Woolen Company, and the most prominent and influential man connected with the woolen industry, was indicted on the 30th ult., in Lawrence, Mass, for conspiracy, the charge being that at the time of the recent memorable strike at the Lawrence mills he procured the "planting" of dynamite in several places on the premises of strikers, to discredit them. It is alleged that Ernest W. Pitman, a contractor, who built the Wood mill, the largest structure of its kind in the world, obtained the dynamite at a quarry near Boston, that it was carried to Lawrence by Dennis Collins and John J. Breen, and that Breen, a member of the Lawrence School Board, "planted" it where it was afterward found. Pitman confessed, it is said, to the District Attorney. Having been summoned to testify before the grand jury, he committed suicide. This was on the 27th ult. Collins was indicted, with Wood and another whose name has not been published. Additional indictments are expected. Breen is the prosecutor's chief witness. It is said that he received $600 for his work. Mr. Wood asserts that he is innocent. ——The trial of Clarence S. Darrow, in Los Angeles, for bribing or attempting to bribe Juror Bain in the McNamara case, will begin on October 21. On the charge that he attempted to bribe Juror Lockwood he was tried and acquitted.

Trusts A Federal grand jury at Dallas, Tex., has indicted the Standard Oil Company of New Jersey, the Standard Oil Company of New York, John D. Archbold and six other men for violating the Sherman act by conspiring to wreck the Pierce-Fordyce Oil Association by means of the Magnolia Petroleum Company. This indictment, for a criminal offense, is the result of three months' investigation, and it involves disobedience of the dissolution decree of the court in the main Standard Oil case. It may lead to proceedings for contempt.——Testimony in the Government's suit against the International Harvester Company, in which George W. Perkins is interested, will be taken on the 16th in Chicago.——At Seattle, on the 27th, witnesses were heard in the suit against the Northwestern Lumbermen's Association.——In New York, the District Attorney, responding to the answers of defendants in the suit against the Coffee Trust, asserts that they are insufficient and evasive.——Two associations which supply plate matter, ready for the press, to thousands of weekly papers in rural districts, were recently restrained by a dissolution decree. Each now accuses the other of disobeying the order by using unfair methods.——Under a State law, Mississippi's Attorney-General has sued the Standard Oil Company of Kentucky for $1,615,000.

The Panama Canal It was officially announced in London on the 2d that the British Government would ask for submission of the Panama toll controversy to arbitration, under the arbitration treaty of 1908. The British protest against the exemption of American coastwise ships was renewed on the 28th ult., with an intimation that arbitration would be sought if a satisfactory settlement could not otherwise be reached. It has been understood at Washington that our Government would decline to submit the question to arbitration. The English newspapers express their inability to believe that our Government will refuse. Those prominently identified abroad with the international peace movement say refusal would be a severe blow to arbitration. The Panama Canal bill and the President's approval of it continue to be sharply criticised by the European press.——Owing to the bill's provisions concerning steamship lines owned or controlled by railroad companies, the Pacific Mail Company has canceled orders for $12,000,000 worth of ships.

Our Envoy in Cuba Beaten Hugh S. Gibson, United States chargé d'affaires at Havana, was in conference with the Cuban Cabinet on the 27th ult., asking for a prompt payment of the Reilly claim of $557,000 for the construction of waterworks at Cienfuegos. There were objections. He insisted, having been instructed to do so. He declined a check and received payment in cash. That evening, as he entered a restaurant, his face was slapped and he was knocked down by Enrique Maza, a reporter, who resented, he said, the humiliation of Cuba. Maza was knocked down by E. W. Bell, second secretary of our legation, and then arrested, but when he was taken before a magistrate he was discharged, altho he admitted the assault. His defense was "patriotism." Mr. Gibson protested against the release of the man, and thereupon the latter was arrested again, but only to be released on a bond of $500. Our Government then protested, and Maza was arrested again and sent to jail. In the meantime several local newspapers had been attacking Mr. Gibson in articles full of the vilest abuse and insults. Lies about his private life and history were printed. He was called a coward and an insect. His face was slapped (in print), his recall was demanded, and all Yankees were cursed. One of the papers is owned by a former member of the Cabinet; another by Congressman Fernandez. Maza was made a hero, and popular subscriptions for his benefit were suggested. But ample apologies were given to Mr. Gibson by President Gomez and others in high office, and other foreign legations exprest their indignation. Reports to Gomez from Cuba's Minister at Washington caused some alarm, and on the 1st Gomez sent a long cable message to President Taft. He exprest re-

gret and indignation because of the assault, promised that Maza should be justly punished and that the newspapers should be prosecuted for libel, and appealed for a friendly settlement, fearing, he said, that our Government might err because of exaggerated reports. Mr. Gibson, he added, had been courteous and affectionate, and worthy of every consideration. In conclusion he asked for a cordial declaration that would "quiet our minds" and restore confidence.——In Santo Domingo the Government has regained possession of Dajabon, recently captured by the revolutionists.——Owing to the reciprocity agreement of Canada with the West Indies, the West Indies Fruit and Sugar Company, capitalized at $10,000,000, to own plantations, steamships, mines, docks, etc., has been incorporated, with headquarters at Toronto, by powerful Canadian financial interests.

Nicaragua's Revolution

Alarming reports caused President Taft, on the 27th ult., to order that the Tenth Regiment of Infantry be sent at once from Panama to Nicaragua. Twelve hours later this order was rescinded, owing to assurances that the rebels would permit use of the railroad between the port of Corinto and the capital, and that by the 3d inst. there would be 2,000 American marines in the country. On the 28th 200 marines made their way to Leon. From that place 100 went on to Managua and 100 returned to Corinto. On the following day Rear-Admiral Southerland arrived at Corinto on the "California," and promptly dispatched 500 marines to repair and open the railroad. His ship then went to Panama to bring back 750 more marines. One party of 50 marines, while at work on the railroad, was fired upon, and was forced to retreat. At last accounts, however, there had been no other attack. All the important towns in western Nicaragua, except Managua, Corinto and San Juan del Sur, are held by the rebels, whose hatred of Americans is intense. There has been much suffering in the towns which they hold, and also in Managua, owing to lack of food. The situation in Matagalpa, a town not easily reached, causes anxiety at Washington. There are 125 Americans in Matagalpa. The rebels are cruel and barbarous in their warfare. They have repeatedly fired on flags of truce. After the attack upon Managua there were found on the battlefield the bodies of twenty-four women, who had carried ammunition for the Government troops and had been slashed and butchered with machetes. The rebels' representative at Washington, General Altschul, formerly Zelaya's consul-general at New Orleans, asks for the withdrawal of the marines. He has had interviews with Senator Bacon, who objects to the presence of the marines in Nicaragua, and on whose motion a committee of Senators has been appointed to make inquiry. Altschul asserts that the marines were sent in the interest of Wall Street and dollar diplomacy.

The Situation in Mexico

Orozco, withdrawing from Juarez, avoided the Government troops and joined Salaza. The two, having 900 men, were attacked and beaten at Ascension, 60 miles from Juarez, and 76 of their soldiers were killed. But the Government has not restrained the remainder of Orozco's army, which, in small bands, has made a reign of terror in Sonora, where many cruel and atrocious crimes have been committed. The Mormon colonists of Sonora are fleeing to save their lives, leaving their crops and live stock, as did the Mormons of Chihuahua. Eighty families crossed the boundary last week. All Americans must go, the rebels say. General Campa, in a public address at a mining camp, said that all of them would be driven out after the 16th inst. He sent word to this effect to the American consul at Agua Prieta, which adjoins Douglas, Ariz. If they should remain, he added, they would lose their property and perhaps their lives. Because of this, our Government has increased the military force on the border. The rebels surrounded the American mining camp of El Tigre, last week, and demanded surrender. The miners, with whom were nine women, preferred to fight, and the attack was delayed. Capturing Oputo, after a battle, the rebels threw dynamite bombs into houses to kill women and children, assaulted young girls in the streets and made captives of several.

Two American mining engineers employed by the Mulatos Company are held for $40,000 ransom. Two escaped from the El Oro mine after killing three rebels and undergoing great hardships. The Federal garrison has been withdrawn from the Cananea copper mining camp, where there are 2,000 Americans. Our Minister complained of this and of the burning of forty-five bridges on the Southern Pacific road. Rebels raided the Culberson ranch, in Texas, stole 100 horses, and were driven back by our cavalry. Dr. Wilson, who was Orozco's surgeon-general, has left him and returned to Oklahoma. He asserts that the rebels have killed foreigners by tearing them limb from limb, using horses that pulled ropes tied to the victims' ankles. Depressing reports come from the South, where, in the States of Mexico, Morelos and Vera Cruz the Zapatists have been guilty of fiendish atrocities. Some say the Madero Government is indifferent or callous. A plot for the capture of the capital by Zapatists on the 16th was discovered last Sunday.

South America Many persons were killed at Para, Brazil, last week, in riots accompanying the election of a Governor. A newspaper office was burned. One of the candidates was arrested. A man who shot at another candidate was lynched. ——Percival Farquahar, sometimes called "the Harriman of South America," has procured the aid of prominent bankers in New York, London, Paris and Berlin for the consolidation of several South American railroad companies, whose lines extend northward from Buenos Ayres and Montevideo. His aim is to connect with certain Brazilian roads, to include these in the combination, and to construct tributary lines in Uruguay, Paraguay and Bolivia. ——Chile has planned extensive fortifications for the ports of Valparaiso and Talcahuano. An order for the guns has been given to a company in this country. ——Venezuela's Minister of Public Instruction is in Ithaca, N. Y., inspecting the School of Agriculture connected with Cornell University. His Government is about to establish a similar institution at Caracas. A representative of the Chilean Government is in this country studying our forestry methods. At present he is in the Adirondacks. Peru's new President, Guillermo Billinghurst, formerly mayor of Lima, whose accession was recently proclaimed, said in his message that he favored the employment of specialists from this country in Peru, and the investment there of United States capital.——Castro, formerly President of Venezuela, has bought property in Spain, and has told the Spanish Government that he desires to live in that country quietly, being weary of political conspiracies and intrigues.——A new revolt in Ecuador, led by Colonel Bejerano, has been checked by the defeat of the revolutionists at a small town near Guayaquil.

Britain and Ireland Irish Nationalists are angry at the granting of the use of the Belfast City Hall for the signing of the Unionist anti-home-rule covenant on September 29. The British War Office has refused an application for disused rifles for the new organization called the "Citizen Volunteers of Ireland," which is said to follow non-political lines, but which has for a prime mover Robert James McMordie, Unionist member of Parliament for East Belfast, and former Lord Mayor of Belfast.——The *North German Gazette* of Berlin quotes a statement from the Indian press to the effect that a commission now in session at Simla under the presidency of Field Marshal Sir William G. Nicholson will propose to disband over twenty native regiments and send home six English battalions. This commission was appointed mainly to discuss whether Indian military expenditure could be reduced without an impairment of efficiency. The Manchester *Guardian* (Liberal) says that the British commanders in India doubt the fighting value of the native troops. Some of the southern Indian regiments were disbanded some years ago by Field Marshal Viscount Kitchener (now British Agent and Consul-General in Egypt). The reforms will affect Bengali and Sikh regiments in especial, the *Guardian* says; adding that the Sikhs, supposed to be the flower of the Indian army, are no longer efficient. It is suggested that this

may be a euphemism for disaffection. ——A large number of Egyptian Nationalists were arrested on August 26 at Cairo, charged with displaying seditious posters.——Failure to go to the relief of vessels in distress is a misdemeanor, punishable by two years' imprisonment, according to a notice sent to ships' captains on August 26 by the British Board of Trade.——Six colleries at Llwynypia, in the Rhondda Valley, Wales, are idle, owing to a wage dispute.

French Notes

The French Cabinet has instructed the Minister of Education to call upon the school teachers' unions to dissolve in consequence of certain resolutions adopted at their National Federation Congress. The Cabinet considered that the educators of youth were seriously endangering secular education by adhering to anti-patriotic works and decided that the attitude of the unions was intolerable. The votes of the national congress which principally displeased the Cabinet were a resolution of sympathy with the propaganda of the "Sou du Soldat," an organization which, under the guise of assisting soldiers during service, propagates anti-militarism, and the determination to send a representative to the next congress of the General Labor Confederation.——The French Minister of War has issued a circular informing officers of the Reserve who belong to certain so-called military leagues that they must decide between giving up the leagues or ceasing to be officers. These leagues, one of which is Masonic and the other hostile to Freemasonry, have their origin in more or less harmless societies for the promotion of friendship which have gradually acquired a political character incompatible with discipline.

France and Morocco

Emissaries sent by the French commander to Marakesh, Morocco, where eight French officers and the French consul, M. Maigret, have been prisoners in the hands of El Hiba, a pretender to the throne, tried in vain to ransom their compatriots. They were unable to gain access to the prisoners or news of them. The Frenchmen were surrendered to El Hiba by the Kaïd El Glaoui, and are said to be held as hostages, being protected by a special guard against the more fanatical members of the pretender's forces. The flying column, commanded by Colonel Mangin, has been given full liberty of action to proceed to the succor of the hostages, if that course seems the best one. They are, however, kept busy

MULAI YUSEF: THE NEW SULTAN

A French journalist writes of Mulai Hafid's brother and successor as Sultan of Morocco: "A good man, supple, docile, in any event exempt from ambition: qualities which will make him an excellent instrument in the firm and skilful hands of General Lyautey."

blocking the progress of El Hiba's men toward Fez and Mazagan. Bad feeling has been developed in France by the report that the Spaniards in Morocco have supplied the enemy with arms. An official report on the subject has been called for by the French Government.—— Southern Morocco is wholly beyond French control; so is the central portion. Most of the country is described by newspaper correspondents as *demi-pacifiée*, and only the coast line as "pacified." There are said to be 48,000 Frenchmen under arms in Morocco, and the Resident-General, General Lyautey, who is now at Paris in conference with the Ministry, wants 30,000 more. The successor of General Moinier as commander under the Resident-General is, as has been reported in this department of THE INDEPENDENT, Gen. Franchet d'Esperey, who formerly commanded the Twenty-eighth Infantry Division at Chambéry. Born at Mostaganem in 1856, this officer was graduated from the military college at St. Cyr sixth in his

class. In 1881 he took part in the Tunisian campaign. After a course in the War College he went to Tonkin, French Indo-China. On his return, as captain, he was made an officer of the Legion of Honor, was attached to the General Staff, and, later, was again sent to Tunis. Since then he has seen active service in China. He is one of the youngest French division commanders.

The Turco-Italian War

On August 28 a squadron of six Italian warships anchored off Beirut, Syria. The vessels had previously reconnoitered the port of Jaffa, in Palestine, and the Syrian ports of Haifa and Acre. The city of Beirut has a Turkish garrison and is said to be well patrolled. The populations of the Syrian coast towns dread a repetition of the February bombardment.——The Italian Foreign Minister, the Marquis di San Guiliano, has stated that his government will not keep the Ægean Islands, now occupied.——The foreign consuls have informed the Cretan Government that the Powers will prevent any armed expedition to the island of Samos; and French and British cruisers have been despatched to the scene. A plot to send Cretan volunteers to Samos, to seize the island and to raise the Greek flag, was uncovered.——General Caneva has started for Rome to discuss Tripolitan military questions with the War Minister. The Italian troops under General Gario are said to have occupied the town of Regdaline, thus initiating a movement toward the interior of Tripoli, and controlling the caravan routes from the Tunisian frontier to Zuara and Regdaline.——Rumors of peace negotiations between Turkey and Italy are recurrent.

Turkey and the Near East

A demonstration against the Government by sixty gendarmes, commanded by two officers, took place in the Galata district of Constantinople on August 29. The mutinous men were promptly surrounded by loyal troops, arrested and imprisoned. Two days earlier the Servian Minister to Turkey denied the reports of a massacre by Turks at Sianitza. The state of panic among Christians on or near the Montenegrin frontier was, however, brought to the Turkish Government's attention, and the Government gave promises to maintain order.—— The Albanian question seems to have been settled, the Albanian chiefs at Pristina having accepted the Government's terms and returned to their homes.—— Referring to the proposal of Count Berchtold, Austro-Hungarian Foreign Minister, looking toward obtaining autonomy for the European provinces of Turkey, the Ottoman Government has notified its diplomatic representatives that, if they are approached on the subject, they shall give notice of the Porte's refusal to hear proposals affecting internal policy. The Berchtold proposal was made on the eve of the eighty-second birthday of the Emperor Francis Joseph. This invitation to the great Powers to engage in "conversations" upon the Balkan question is not everywhere described in the same terms, but the object of the Austro-Hungarian Government is stated to be "to co-ordinate the several efforts made by the Powers in the interest of Balkan peace and of the *status quo.*" It is deemed expedient to give the Porte "organized European encouragement" in well doing, and to recommend to the Balkan states a policy of patience. These vague suggestions have for the most part been welcomed, or treated with reserve, by the European press. So far from declaring for intervention, Count Berchtold himself is quoted as saying that there is no thought of calling a congress or a conference, or of demanding autonomy for Albania or Macedonia. "In short, it is a question of strengthening Turkey by a 'measured decentralization' which would not involve the danger of the creation of new Balkan states." As for the significance of the fact that these suggestions emanate from Austria, the Foreign Minister of that country says that his government

> "has never occupied a stronger situation in the Balkans and with Turkey. Italy being absorbed with the Tripolitan campaign, and Russia still busy with military and naval reorganization, besides being hypnotized by the Persian and Chinese problems, it is Austria who becomes, momentarily, arbiter of the Levant.

There has so far been shown by the various Powers a disposition to play a waiting game, and above all to see to what extent Austria-Hungary is selfish in its proposals.

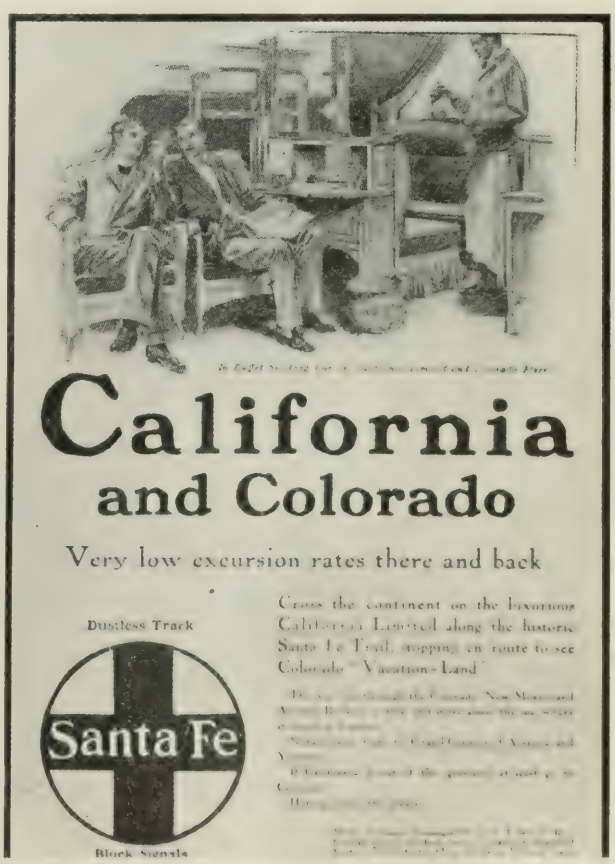
The Mistakes of Advertisers

BY STEPHEN I. COLVIN

[Within the last few years a number of psychologists have directed their attention to the question of advertising in order to determine by actual experiments the relative effectiveness of various methods. This article by the professor of psychology in the University of Illinois gives some of the results of these studies in such a practical way that the reader can apply the principles for himself.—EDITOR.]

UNTIL recently the White Rock sign at the head of Times Square flashed forth its message over the radiant path of New York's Great White Way. Now the onsweep of the city's progress has removed it, and the most effective of all of the electric displays on Broadway is but a memory. This sign combined in an unusual degree the three essentials of successful advertising. In the first place, it *gained the attention.* This it did in part because its position was such that it stood out among all of the other electric devices in the neighborhood. Further than this, the nature of the sign itself was such as to at once catch the eye and arouse the interest. In the second place, this sign not only secured attention, but it held the attention long enough *to make an impression and stamp itself on the memory.* This it did by joining its most striking feature, the clock in the center, outlined in fire, with the clever epigram beneath, "The water for all time." Here was a clear sense impression joined to a definite association, and the psychologist has shown us that impression and association are the two requisites for memory. But the White Rock sign did more than gain the attention and fix itself on the memory; *it created a desire* and certainly must have *secured results.* How many countless thousands of the city's dwellers and of the passing throng have looked upon it some hot August evening, and looking have seen the flow of its mimic waters, as they gushed in a pulsating electric stream from the two fountains at its sides; have sensed the refreshing green tints of its color scheme and have thought of sparkling springs amid mosses and ferns. Thus looking, they have longed to drink, as in boyhood, and quench their thirst in the delicious coolness.

Farther down Broadway, near Herald Square, there stands another sign, more elaborate than the White Rock advertisement, and even more suited to attract the notice of the passerby. This sign depicts the famous Ben Hur chariot race, above which are various announcements that appear one by one for a brief space of time. Of the millions that have seen this sign but few have forgotten it. They can recall in imagination the galloping steeds, the flowing robe of the charioteer, the flaming torches and the brilliant colors. But how many can tell what are the advertisements above? And "there's the rub." This sign stands out as a conspicuous failure among the many on the Great White Way. It has missed the essential principle of all successful advertising, namely, that of creating a desire for the goods advertised. The chariot race has no connection with the many advertisements that are fitfully displayed above it. They come and go



A MATTER OF EMPHASIS (I)
This railroad gives chief place to the delights of a summer resort

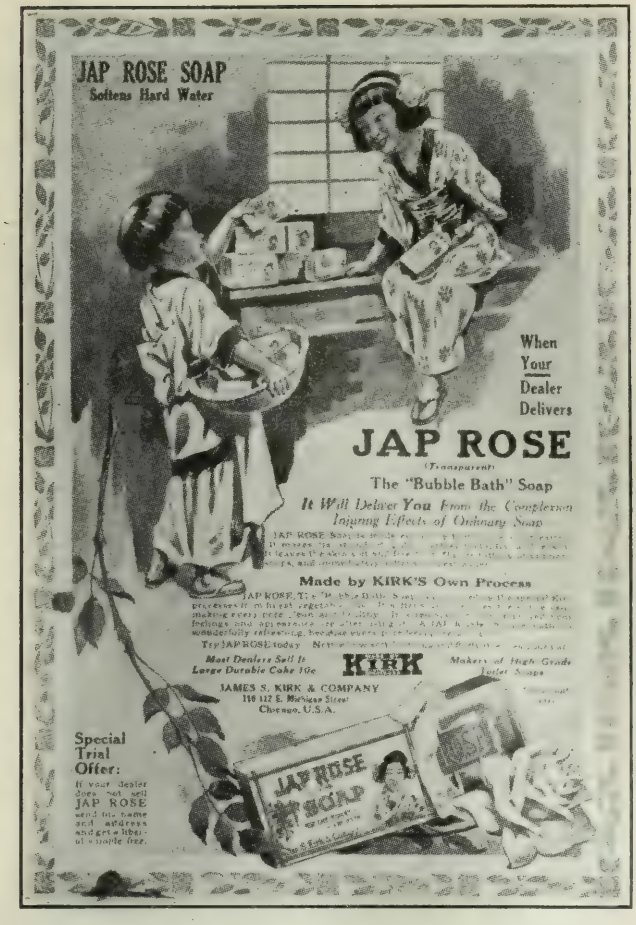
in seeming endless succession, but the bystander is looking for the flashing forth of the picture beneath; he is thinking of its perfection and ingenuity, and he pays but slight heed to the announcements above. The very elaborateness of the picture serves to distract the attention from the advertisements themselves and they are promptly forgotten, if they are ever noticed.

There is a third electric display among the galaxy on Broadway that deserves mention as an example of what is essentially bad in advertising. This is a recently added creation, the product of an ingenious but perverted fancy. It depicts an uncouth Brownie grasping and hanging by the bristles of two upright toothbrushes. One of these is sustaining his weight, while the other is losing its bristles at such an alarming rate that the safety of the Brownie seems in danger and you expect that at any moment he will tumble down a hundred feet to the pavement below and end his inglorious career. Indeed, it would be a good thing for the advertisement if he did, for who desires to associate a toothbrush with such an unpleasant figure? We are not even impressed by the statement that informs us that Blank's (I have forgotten the name; we usually forget unpleasant things) brushes never lose their bristles; we do feel, however, that toothbrushes and Brownies should not keep company and we do not care for the kind of a brush that forms such associations. This Brownie advertisement goes one step further in the wrong direction than does the Ben Hur sign; the latter fails to create a positive desire, while the former induces a negative one. We simply do not want the brush.

It has been estimated that a billion dollars are spent annually in advertising, and at least a quarter of this sum is entirely wasted. Not more than one-fifth of the advertisements constructed are thoroly effective, while the large majority produce results that are far below the possibilities of properly devised advertisements. The one desire that seems to possess the advertiser is to get the attention, never mind at what cost. A large number do not appear to be aware that it is equally necessary to make a permanent impression and to

A MATTER OF EMPHASIS (II)
This railroad places the comfort of travel first. Which is the more effective?

THIS ADVERTISEMENT TRICKS YOU BY A MISLEADING HEADING
Does it impress you in favor of the article advertised?



create a desire. Many advertisers seem to take infinite pains to emphasize the wrong thing. For example, the railroad that solicits your patronage should not exploit the resort that it carries you to and ignore the comforts of travel on the road itself. There is more than one way to reach your destination. Compare the two accompanying advertisements of the Rock Island and the Santa Fé railroads, and notice which is the more effective from the standpoint of the road itself. One makes you wish to go to Colorado, the other to travel by the Santa Fé.

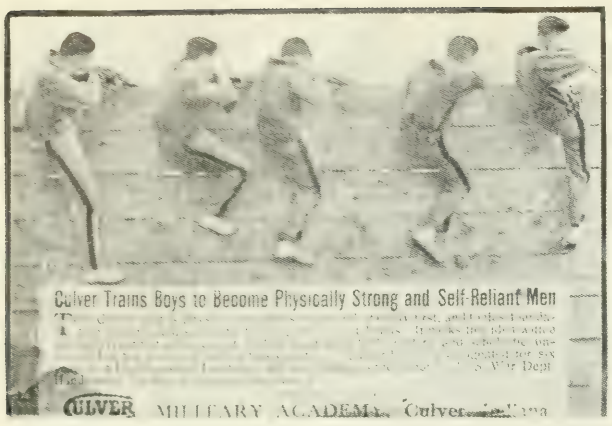
A similar mistake in emphasis is the familiar device of using a catchword or phrase that is in the public mind, thus gaining the attention, but ignoring the fact that the phrase has no relation to the advertisement as such. The accompanying advertisement of Pears' soap is at fault in this particular. Your attention is at once arrested by the question, "Who will be the next President?" You soon see that you have been tricked, however, and a mild resentment against the advertisement is likely to be aroused for this reason. This is such an obvious violation of an elementary psychological principle that it seems strange that it is still so often made.

The majority of advertisements are not simple and direct enough. They try to cover too many points; say too many things; give too much information. A single advertisement, to be thoroly effective, should emphasize a few clearly presented features, and should say what it has to say in as brief a manner as possible. With this principle in mind, compare the advertisement of Jap Rose soap and of Sapolio. Both occupy approximately the same space, but the former has too much detail in its illustration, and too much discussion; on the other hand, the latter is simple, direct and holds the attention to one essential fact. This is emphasized in both the reading matter and in the picture, while the Jap Rose advertisement is indefinite both in picture and in wording. It fails to make its points. It is also at fault, as is generally the case with advertisements of this character, in employing print so fine that an effort is required to read it. The resulting eye strain leaves an unfavorable

SIMPLICITY VS. COMPLEXITY (I)
This advertisement makes a direct unequivocal appeal

SIMPLICITY VS. COMPLEXITY (II)
This advertisement distracts the attention with the multiplicity of irrelevant material

impression. This is invariably a fatal error in advertising. Better no statement at all than one that is difficult to read. It alone is sufficient to create a prejudice against what is offered for sale.



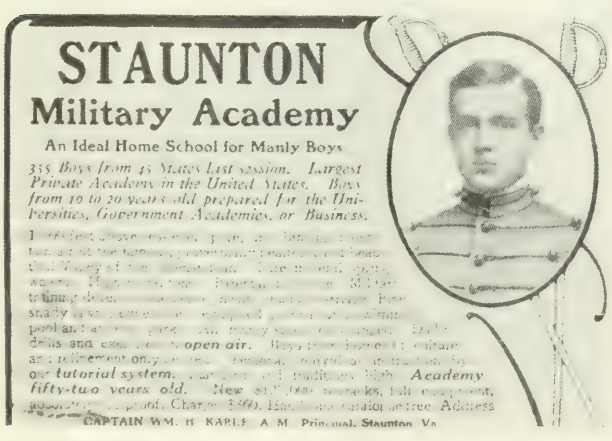
It is generally recognized that pictures are an effective means of gaining the attention and pushing home the points that the advertisement aims to emphasize. An interesting fact has been discovered, however, in a series of investigations recently concluded by Dr. E. K. Strong, of Columbia University, namely, that about half of the persons whose advertising preferences he investigated placed the picture advertisement high and the "copy" or reading matter advertisement low, while the other half showed just the opposite tendency, preferring advertisements with reading matter as their main feature. He therefore concludes that the most effective advertisements combine both the reading matter and the picture. The accompanying illustration of an Ivory soap advertisement is exclusively a picture advertisement. It is well executed and makes its point in a very definite manner, but it would not strongly appeal to those who are attracted principally by the copy features of an advertisement.

In employing pictures as a medium of advertising it should be kept in mind that pictures that suggest action are particularly effective not only in attracting the attention, but also in making a permanent impression. A picture that does not suggest action has, as a rule, much less value. Compare the two advertisements of military schools in the accompanying list of illustrations, and you will at once see the possibility of suggesting action by means of a picture. The Culver Academy advertisement is activity itself; it expresses the fighting spirit and thus makes a strong appeal to one of the most fundamental of human instincts. The Staunton Academy advertisement, on the other hand, while in other respects well executed, lacks the spirit that characterizes its rival.

The appeal to instinct or deep-seated interest is often the most potent means

HOW DOES THIS IMPRESS YOU?
A good example of a picture advertisement. Many persons take exception to such an advertisement, preferring a "copy" advertisement

ACTION VS. REPOSE (I)
This picture is tense with action



of creating a desire. Such an appeal is most successfully made in the accompanying advertisement of the American School of Correspondence. Love of home, devotion to family, pride in achievement for the sake of those that are nearest and dearest, are all stimulated in the striking picture that introduces the reading matter. It is well worth while to study the various advertisements that are prepared by this school. They are for the most part of the same character as the one illustrated in this article. They make an appeal to some strong desire or ambition, and their "pulling power" must be for this reason great.

Advertisements cannot rely solely on argument or on emotional appeal to insure success. The general "atmosphere" of the advertisement is also important. There should be nothing to offend the taste or create a repulsion. We have already pointed out how such an attitude of mild disgust may be created by emphasizing some unpleasant feature, as in the case of the toothbrush sign on Broadway. The same error is found in an advertisement of White Star coffee, that associates the beverage with three slimy frogs. A similar mistake is illustrated in the accompanying Toasted Corn Flakes advertisement. The picture is striking, but is not likely to stimulate the appetite. Indeed, the effect is just the opposite. On the other hand, the Campbell's soup advertisement suggests something delicious to eat; it succeeds in creating an appetite. It is an interesting fact that since the days of "Sunny Jim," of "Force" advertising fame, the manufacturers of food products have been particularly prone to advertise their wares thru the medium of some uncouth figure. The motive behind this kind of advertising is quite apparent. The desire to secure attention without considering anything else is responsible for such an evident mistake.

A considerable number of food advertisers who do not fall into this error nevertheless generally ignore the appetizing qualities of their product, or give them but a secondary place at the best.

A STRONG APPEAL TO A FUNDAMENTAL INSTINCT

ACTION VS. REPOSE (II)
This picture suggests repose. Which is the more effective in gaining and holding the attention?

A QUESTION OF TASTE (I)
This advertisement creates a desire for the food advertised

They place greater and generally undue emphasis on some feature that possesses far less pulling power. Just at present it is the wholesomeness and strength-giving qualities of these foods that are given the first place in these advertisements. For example, the "Postum" appeal is largely from the standpoint of hygiene. The nourishing properties of Postum and the dangers of coffee are dwelt upon almost exclusively. "There's a reason," but probably not the most powerful one, to induce the coffee drinker to give up his beverage and substitute Postum. James has urged with no little truth in his larger psychology that we eat and drink merely for the pleasure of eating and of drinking, not for some ulterior purpose, such as strengthening the brain cells or adding to our avoirdupois. It is not altogether true, however, that considerations of the wholesomeness and health-giving qualities of foods make no appeal to the consumer. This Strong has shown in the investigation previously referred to. His subjects placed advertisements of foods that set forth their purity and strength-giving character relatively high in the list. There seems to be no doubt that this appeal has weight, but it is surely inferior to an appeal based on the delicious qualities of the foods advertised. It is certain that the joy that comes in eating what is pleasing to the taste should never be passed over slightingly, as is often the case in many of the food advertisements of the present day.

Among the most important facts that the advertiser should constantly keep in mind, some of which have already been discussed, are the following:

(1) To gain the attention is the first requisite of successful advertising, but this alone is worthless. It is futile to arouse the attention unless an impression can be made and a desire created.

(2) Every portion of the advertisement should have a reference to this desire. There is no place for irrelevant material. It is worse than useless; it is positively injurious, since it serves to distract the attention from the essential features of the advertisement.

(3) This desire may be stimulated in various ways, by argument, by suggestion, by appeal to the fundamental instincts and interests. This last appeal is the most potent of all. Ambition, pride, rivalry, love of social approval, curiosity, the play impulse, the hunting impulse, the hoarding and saving impulse, the desire to gratify the appetite, the tendency to sympathize with others and other

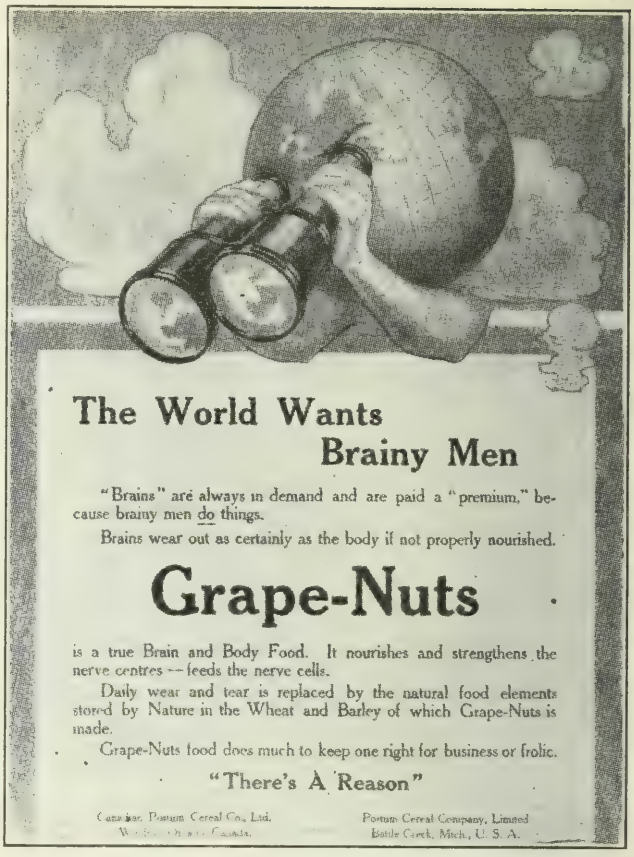
A QUESTION OF TASTE (II)
This advertisement at once attracts the attention, but does it whet the appetite?

powerful instincts lie at the basis of such appeals.

(4) The most successful advertisements avoid complexity in their presentation. Their illustrations are simple and their reading matter is brief and to the point. And brevity is the soul of good advertising.

(5) The atmosphere of the advertisement must be considered. It should always be in good taste; there should be nothing that either directly or indirectly offends the prejudices or the judgment.

(6) The form of the advertisement is important. It should be made as attractive as possible. The type in particular should be clear and sufficiently large to be easily read. Fine print should never be employed.



(7) The position that the advertisement occupies is also a matter of significance. The good advertisement must avoid bad company. It must not appear with advertisements that are cheap, vulgar or poorly constructed. Further, it should not be assigned to a crowded space, never mind how popular this space seems to be.

(8) The most effective advertisements combine both the picture and the copy features. Neither should be used to the exclusion of the other, if the widest possible appeal is sought.

(9) The picture advertisement should suggest some form of action, and this should directly bear upon the main features of the advertisement. It is to be remembered that action that has nothing to do with the advertisement as such distracts the attention.

(10) Recent investigations concerning the effectiveness of various appeals in advertisements show that the wholesomeness or durability of the product, the age and reliability of the firm, the pleasure connected with the use of the article advertised and its popularity have great pulling power. On the other hand, with the better class of purchasers at least, an emphasis on cheapness, the giving of prizes and presents, excessive boasting as to the value of the article advertised, letters of recommendation, accounts of the prosperity of the firm and the extent of the manufacturing plant tend to create distrust and even disgust.

(11) As a medium of advertising the daily paper is probably not as efficient as

DO WE EAT BECAUSE WE LIKE TO, OR TO INCREASE THE STRENGTH OF OUR BRAIN CELLS?

is sometimes supposed. The greater the news value of the paper the less its advertising value per reader. But a small number of persons habitually read the advertisements. During the recent "Titanic" disaster the advertising value of the daily press must have fallen off greatly. Everybody was eager for the news; they cared little for anything else in the paper.

(12) Finally it should be remembered that an article that has no merit in itself is not likely to be permanently successful thru advertising. The advertisement cannot perform a miracle; create something out of nothing. All that it can do is to emphasize merit where it exists; it cannot make this merit. The public, when once fooled, is likely to remember the fact. Even if a sham succeeds because it is advertised, this success is purchased at an economic waste. It is positively immoral to advertise a sham. The principle has thus an ethical as well as a commercial import. The ethics of advertising all reputable newspapers and magazines are beginning to recognize, greatly to the benefit of these papers and magazines and to the public as well.

URBANA, ILL.

A Visit to John Masefield

BY JOHN COURNOS

[Those who are ever on the lookout for "coming men" are now talking more of John Masefield than of anyone else, so we are glad to present to our readers this recent interview by a young American journalist now visiting England for the first time. We recognized Masefield's ability in the first book of his that came to our desk, "On the Spanish Main" (reviewed August 30, 1906), an unpretentious volume which professed to be nothing more than a compilation of the narratives of the pirates of Panama, but which was really a very skilful reconstruction of the romantic history of that period. In our issue of May 23, 1912, we reviewed his volume of verse, "The Everlasting Mercy and the Widow in the Bye Street," and in the issue of May 30 printed a general critique of his work by Mary Lamberton Becker. Among his prose works are two plays, "The Tragedy of Nan" and "The Tragedy of Pompey the Great"; two novels, "Multitude and Solitude" and "The Street of Today"; "William Shakespeare" and "Martin Hyde," a tale of the Pretender for boys.—EDITOR.]

JOHN MASEFIELD, who is still on the good side of forty, lives in Great Hampden, a small, secluded village in the heart of Bucks. To get there you take the train for Great Missenden, a journey of twenty-eight miles out of London. You arrive there, say, on a blazing hot day, and when you make the startling discovery that your journey still lies "over the hills and far away," with a four miles' jaunt on foot ahead of you, you find yourself wishing you had left your waistcoat at home.

Up and down you go, up and down—mostly up—over a winding, undulating, sun-beaten, somewhat dusty road; past poppy fields; past great rolling meadows, green with at least seven kinds of green; past stacks of new-mown hay, whose sweet scents reach your famished city nostrils despite the absence of even the semblance of a breeze; past a swimming pool in which youngsters are disporting themselves—splashing coolness and happiness at each other; past an occasional house, not forgetting "The Green Man," an oasis for dry, non-abstaining throats; and finally thru a glade of magnificently tall trees, until you emerge on the open road again, where, after another fifteen minutes or so, a number of thatched roofed cottages loom up before you to proclaim the fact that you have reached the village. No country in the world, except England, can show so much in four miles, and all in all it makes a fit path to a poet's house.

You find yourself quite often in the course of your jaunt vaguely employing your mental faculties in the pardonable occupation of imagining what sort of man the poet is; and at a whimsical moment, simultaneously with a squirrel dashing across the glade, an amusing thought, not less rapidly, skims across your brain: you happen to think of Oscar Wilde's observation that "you can only write in cities." For, after all, this road and the poet's village are Masefield's first consistency, a consistency which dates back to the remote time of his life when he penned his poem which began:

"Oh, London Town's a fine town, and London's sights are rare,
And London ale is right ale, and brisk's the London air,
And busily goes the world there, but crafty grows the mind,
And London Town of all towns I'm glad to leave behind.

"Then hey for croft and hop yard, and hill, field and pond,
With Bredon Hill before me and Malvern Hill beyond,
The hawthorn white i' the hedgerow, and all the spring's attire
In the comely land of Teme and Lugg and Clent and Clee and Wyre."

Even then, as can be seen, Masefield displayed a distinct fondness for the rugged staccato of short Anglo-Saxon words.

The poet's house, a rather longish, ornate structure of flint—unprotected by

shade trees and having a considerable plot in front, part of which is utilized as a garden—faces what seems a lane. A lovely little girl is playing in the garden, and, having replied to your question as to whether Mr. Masefield resides here in the affirmative, she bids you to enter the house, or sit down on the bench just outside of the small arched doorway, while she will go and fetch father. She takes your letter of introduction with her.

Presently you hear footsteps; a man's voice tenderly addressing a child; and you are not surprised to see a fairly large, rather roughly dressed, but gentle looking person, a babe on his arm, appear in the doorway—it is Masefield, the Masefield your fancy has pictured, only more so—perhaps you hadn't counted on his hair being a bit red. But if you expected to find him human, you find him abnormally human. This impression of him is such a persistent one that at this moment it is much easier to recall the poet's personality as the spirit of some splendid human presence than as a definite physical portrait. Yet his physical features lack nothing of strength. A more favorable opportunity to study his face came after we entered the house, having strolled and chatted a while outdoors—the baby still upon his arm.

A good, well-constructed head is Masefield's—attractively broad across the eyes; its lower jaw hints at strength without flaunting it. A tinge of gray in closely cropped hair adds not a little to its character; while the small mustache is an effective touch in the portrait because of its more pronounced red. The elusive eyes are a live hazel, bordering on gray; it is these that help to give the face, especially in three-quarter view, an indescribably gentle, soft and reflective aspect, that does not take away from its masculine look, and only serves to give the countenance a certain quiet balance. It is as if the forceful features of the poet's physiognomy—that is, their sum total—were held together as by some strange, enveloping unity, evasively working, as it were, to mold and subjugate the physical peculiarities to a spiritual, or, if you prefer, human harmony, creating in the process the singular attractiveness of this poet's personality. One feels no scruple in applying to the resulting produce a happy characterization of Pater's—"that strange interfusion of sweetness and strength"—in this instance, a personal quality which transmitted into a literary force becomes "The Tragedy of Nan," "The Everlasting Mercy," and the "Widow in the Bye Street," works rich in suggestion of a virile, backboned spirituality that loses nothing by having to deal with real people and real emotions.

For a brief interval Mr. Masefield has gone out of the room to dispose of the child, and you are left alone in the study. The floor is scattered with children's playthings and nursery rimes. But there are some good books against the walls, and others on a large table in the center of the room. You scan the titles; there is a pleasant surprise in the nature and variety of the poet's reading—among other things is a volume on electrical experiments, a volume on Euclid; there are volumes on sociology and economics—it is natural to find philosophy represented here—and a sprinkling of drama, poetry and fiction. Apparently there is more actual knowledge back of the poet's literary simplicity than the reader is ever permitted to suspect.

Your meditations in the matter are interrupted by the reappearance of the host, who tries to put you in the most comfortable chair, apologizing at the same time for the nursery effects on the floor, which he makes an attempt to gather up and out of the way. He then helps you to a cigarette, of which he has a supply, tho he does not smoke himself, and lights a match for you; and, as if this were not enough, in a jiffy he prepares a delightful cup of coffee. By that time you are perhaps prepared—for an interview? No, for a conversation. At the beginning one might as well admit that to interview Masefield is to go on a holiday. He makes you forget the object of your visit—and you find yourself somehow answering almost as many questions as you ask. After a bit, however, you try to get down to business.

"Mr. Masefield," you begin, "nothing has stirred me so much of late as your two magnificent poems in the *English Review*. They seem to suggest new possibilities in narrative poetry—do you

Camera Portrait by Hoppe

JOHN MASEFIELD

think this sort of verse has a future in England?"

"I am glad you liked my poems," replied Masefield, quietly. "On the whole, I think there has been little English narrative poetry. There is Chaucer, but after Chaucer there is a big gap. What I would like to see"—a quiet enthusiasm seemed to be playing behind the poet's words—"what I would like to see is a revival of English dramatic poetry. I would like to see again the platform stage, the Shakespeare stage, which is better fitted for the production of poetic

drama than the modern stage; the stage today is too far removed from the audience, and the figures you see in it are like little figures in a picture. What we want is a stage that will place the actor in a much more intimate relation with his audience."

Attributing the failure of poetical drama today chiefly to the absence of such a stage, Masefield seized hold of a number of books that happened to be within his reach and arranged these on the table, with a view to illustrating how well the platform stage worked in practice. The arrangement practically showed two stages, separated merely by two posts—one at each end of the partition; at the extreme end of one of the two platforms was a door leading to the actors' dressing rooms; directly over the door was a balcony, which could be used either to represent an upper window, or as the balcony itself, as in "Romeo and Juliet." Not only did this stage, the speaker went on to explain, bring the actors into intimate relation with the audience, who almost completely surrounded it, but the double arrangement prevented any interruptions of the play, for it made it possible, as soon as one set of actors was thru with one stage, for another set to go on the other.

"A poetical play of that day," added Mr. Masefield, "represented partly a clash of will, and partly was a pageant of life." Moreover, the appeal made by a play of that kind was, in Masefield's estimation, "fuller, richer and more varied than is possible when the stage is far away from the people to whom the actors are appealing." The poet then went on to describe in most enthusiastic terms the sword play, or sword dancing, which he had seen in his youth in England, from some form of which, in his opinion, the poetic drama originated.

He expressed himself as hopeful for a revival of the English poetic drama. He saw strong indications of it in the plays of Yeats, and Yeats has a following. There is Lascelles Abercrombie, for one, who, Masefield thought, may come to something.

"Perhaps you have tried something of the sort yourself!" suggested the visitor.

"I have begun two prose plays," admitted Masefield, "which I am trying to construct for that kind of stage—and not the modern stage. One—a country play—will have, however, a chorus in verse. The chorus will chant or declaim their lines, while the actors are resting."

Incidentally, it will interest the poet's admirers to know that he is working on another story in verse; in response to a direct question he reticently admitted that he thought his new work better than his two published poems, modifying his statement, however, with the remark that "when a man is done with a work he generally forgets all about it."

"It is rather an extraordinary thing, Mr. Masefield, to achieve what is practically a novel within the compass of verse and yet maintain a consistently high poetic quality."

His reply was: "I feel it's generally easier to let yourself go in verse than in prose. When you try to express passion in prose you find it a rather limited medium—and when those great, rare moments of high tension come upon you, you want a more passionate medium." It is not surprising, then, to hear further that Masefield believes in working at a thing steadily—and accomplishing it quickly: for there is no telling when your interest in a thing delayed may be gone.

Nor did Mr. Masefield see any reason for apprehension as to the present state of English poetry.

"We've got some first rate poets," was his unhesitating reply. "There's Sir Ronald Ross for one—he has written an excellent volume in 'Philosophies.' One of the poems in it, 'In Exile,' is a strangely intimate picture of his mind while under the tense stress of the labors which led him to discover the mosquito theory of malaria; it is altogether a strange, spiritual kind of autobiography."

How many people in America have heard of Ross as a poet? Yet we have the word of Masefield that Ross is "the best all-round intellect in England today."

"Then there is Yeats," resumed Masefield. "He is by far the biggest poetic personality living among us at present. He is great both as a lyric and dramatic poet." But this was nothing to the tribute he came to pay Yeats later in the interview. This proved such a noble dish in this great, rare feast of praise that it

will be reserved for dessert. Nor can the reader complain of the generosity of the next course.

"Thomas Hardy," declared Masefield, "is another big personality. I look on his 'Dynasts' as the only poetical history since the Elizabethan time. And his poems are wonderful. I feel that in 'Time's Laughing Stocks' he has perfected a new form very beautiful in verse and rich in matter; if you try to read these poems aloud you will see how marvelously fitted they are for the speaking voice. In his earlier poems he was working toward this, endeavoring to create a verse form which will be beautiful to speak. And in 'Time's Laughing Stocks,' in the poems 'Revisitation,' 'The Melstock Choir' and 'The Tramp Woman's Tragedy,' you have quite perfect examples of story telling, simple, passionate and wise."

"And what of his novels?"

"Personally I prefer 'The Woodlanders' and 'Two On a Tower.' 'Tess,' to be sure, is a noble thing—and so is 'The Return of the Native.' But I consider Hardy's novels a part of his poetical achievement."

Thru some trick of conversation we drifted temporarily over to American literature. Inevitably the name of Walt Whitman was mentioned, and Masefield observed:

"I admire Walt Whitman. I feel he is your big voice so far. He must have been a splendid man." Then he added:

"I have a great admiration for those American writers whom one may describe as exponents of your democracy. Your democracy is your big achievement, and it has produced a number of writers who have admirably exprest what they have experienced and seen."

Masefield modestly admitted that he hadn't kept track of American literature —and he plied the visitor with numerous questions concerning what the younger men were doing; but there can be no question that, of the American works the poet read, the quality he admired in them was their Americanism. His judgments in some of these were strikingly interesting. He described R. H. Dana's "Two Years Before the Mast" as a "true thing," Andy Adams' "Log of a Cowboy" as "vigorous, curiously direct and picturesque"; he liked Stedman's "Bucking the Sage Brush" for the same qualities.

"You produced a great prose writer," he said, "in Herman Melville, who wrote about the sea. A noble and beautiful book is his 'Moby Dick.' Then the 'Cowboy Songs,' which have been sent to me lately, struck me as having precisely the same qualities of picturesqueness and directness."

American short story writers Masefield considered as "considerable people" —especially Bret Harte, Stephen Crane and Frank Norris. He admired Sidney Lanier. He was familiar with the works of George Ade and Townsend's "Chimmie Fadden," and liked them; but, to the unconcealed amazement of his visitor, he said he had never heard of O. Henry! He promised, however, to make his acquaintance during his next visit to the British Museum. It may, by the way, interest admiring Americans to know that their most popular writer is represented in the venerable and scholarly institution by just three works—and these not by any means the most characteristic. Has some one been napping?

At this point of the interview the maid brought in the tea and some raisin cake, which the host assured his guest was peculiarly English. This was a lucky interruption, for it changed the drift of the conversation, and indirectly brought about the beautiful tribute Masefield paid to Yeats, and proved a climax to what had been to the visitor a most delightful and inspiring afternoon.

"Mr. Masefield," ventured the visitor, "would you mind telling me if there has ever been some one big literary influence in your life—some man or some book? I ask this because there has been some comparison made between you and Whitman. Now, personally, I do not see any resemblance between your work and his. In fact, in many ways they are totally different. If there is any man with whom your work has at all anything in common, it would seem to me, if I may suggest it, that man is John Synge."

"As I said before," began Masefield, "I admire Whitman. But I owe everything to Yeats. He influenced me, just as he influenced Synge. Yeats set us both in the right direction. What glory there is is due to him. He is a perfectly

generous and sympathetic mind to all young writers."

Hardly less hearty was the tribute Masefield paid Granville Barker.

"I look on Barker," said the poet, "as a big force, a noble influence in English drama today. He is an acute and beautiful intellect. He made modern English drama possible by giving it direction; he gave it expression and made the theater for it. His own work is precise, finished and delicate."

John Galsworthy was another man for whom Masefield exprest intense admiration. He particularly admired "Strife" and "Joy" and the latest novel, "The Patrician."

And during the entire talk the poet made it quite evident that his literary preferences were for the palpably human as against mere virtuosity or the "purely literary inspiration," a phrase he once used in the course of the afternoon in describing a poet, whose name will not be mentioned here—because Masefield is in thoro accord with Pater's idea that it is best not to speak unless you can praise. A portrait painter delineating the poet's character will utterly fail if he should somehow miss the subtle brushstrokes which shall suggest this happy tendency of Masefield's.

"Do you think the present scientific age a propitious one for poetry?" asked the visitor, rising to go, his eye falling on the Euclid volume and "Experiments in Electricity."

"Well, rather!" exclaimed Masefield, also rising. "Every bit of knowledge tends to make the mind more interesting and the more a poet knows of what is best in the thought of his own time the better his work will be. A poet's mind ought to be a perfectly equipped house, and the poet ought to be at perfect ease in it—or perhaps I should say that the poet should send his mind thru the world as a master would go thru his own dwelling."

"One thing more, Mr. Masefield. I understand that you quitted school early, and your experience led you at sea and on the road. Do you ever regret not having gone to the university?"

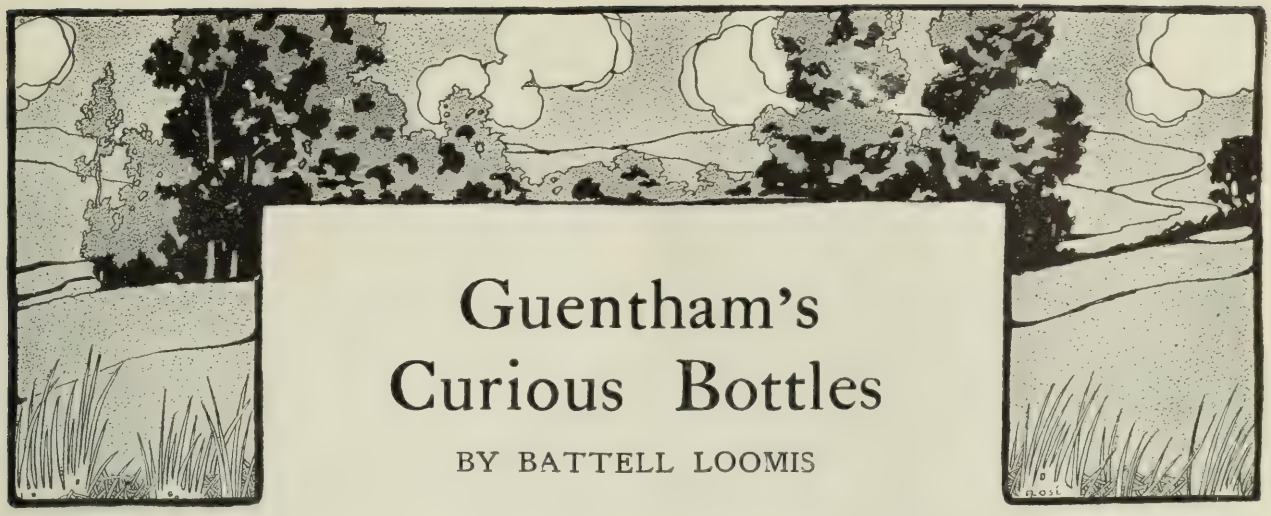
"Yes, one passes there some beautiful years—one has fine fellowship"—the poet for an instant looked wistful—"and then, again, experience has its value."

"And what would you consider the best thing for a young man interested in literature?"

"To read the great masters continually, and to write continually. There is a Welsh saying which tells of three essential things: 'A bold design, constant practice, and frequent mistakes.' A man's youthful work may be worthless, but it is an excellent training for expressing one's self."

By this time we were near the garden gate, and Mr. Masefield was apologizing for deficient hospitality.

"Let me cut you some roses!" he exclaimed.



Having dispatched several of these with his penknife he deftly bound them together with a bit of twine, leaving a handy loop—reminiscent, perhaps, of his seafaring days—permitting their being carried without danger of being pricked by the thorns.

Handing the bouquet to the delighted, departing visitor, he bade him in a most cordial manner goodby—and good luck!

The return journey to the station was accomplished in what seemed like an incredibly short time. What tho the heels ache—if the heart be glad!

London, England.

Guentham's Curious Bottles

BY BATTELL LOOMIS

SUCH a lovely day it was. The sky came down just behind the pine-topped hill so clear and blue and deep that it seemed as if the large yellow butterfly that was sniffing idly at the treetops must mix with it and become a transparent green. Far away northward the ridge of the hill dipped off into a valley that *had* been affected by the sky, for tho one knew it must be green and yellow with midsummer, it looked so blue that it was positively thick. And then the mountain, oh, twice as big as the hill, scooped up out of the valley and climbed 'way, 'way up, till its crest was white in the silent distance. But it was not high enough for snow and its whiteness was due to the heat and the horizon. Then on the right of the hill was another, shallower valley, and beyond the woods that filled it showed the gleaming, drought-polished roofs of several farmsteads and a tall, round funnel that the child knew was a silo (whatever *that* was), but which he imagined was a donjon keep (and as to that identity he was certain).

The child was on the hilltop on a broad granite rock in the sun. It was warm and uncomfortable, but now and then a little of the cool depths of the forest behind him splashed out on a puff of wind and swept by him, and it was just enough to make him enjoy the self-torture he was undergoing. The fact is, he was getting sunburned. He was mostly a city child and he did not have the advantages of country boys, who can begin to expose their arms in early May and work up gradually with the sun to a state of nut-brown tan without losing any skin in the process. He wished he *were* a country boy, but his mother, who often said unaccountable things, said she thought he knew more about the country and loved it more than if he had lived in it all his life.

They weren't summer people, either, for they usually lived in the hamlet six months of the twelve, altho this year they were two months late, because Mr. Dane was a writer, who felt he could afford it. His wife didn't think so, but she had a garden and liked it, and it cost less to live there anyway, so maybe it was all right. Mr. Dane knew it was the best that could be, for he was a sensitive man and the strain and excitement of city life wore on him. He liked to talk to the farming folk. He was over back of the pine woods now, talking to a friend while that stooped, broad-jawed, wrinkle-faced, keen-eyed man was walking up and down his potato field with a patent sprayer on his back and in his hand a nozzle spitting deadly arsenate of lead at the shiny red larvæ which had begun their ravages over night.

The child—perhaps he wasn't a child any more, for he was twelve. Maybe he was a boy. His name was Richard. Richard, then, lay on his back and sweltered manfully, arms extended above his head, to give the under side a chance, you know, and listened to the humming insects and the bubble-bursting songs of the bullfinches and the bobolinks. The latter were occasional and made him chuckle sympathetically; the bullfinches were incessant and rather annoying. They were very cheerful, but they didn't seem to have any purpose. Bobolinks, he knew, were different. They sang to keep their balance on the swaying grass ears and also, when they were flying, to smooth out the air in front of them and

make the going easier. It made anything, even sleeping, easier just to hear them. Richard didn't know why he liked them and didn't care, but they certainly were jolly. Besides the birds and the bees, he was near enough the pasture fence to hear a swish-tailed cow wrapping up green bundles of grass with her tongue and twitching them off, and he could even imagine he heard her gulp as she swallowed each huge mouthful without chewing it any more than enough to wet it. Very unwholesome way to eat, that, so his mother said; still, maybe grass was so thin it didn't need chewing, and surely no one would want to chew it, nasty stuff, unless it was that sweet Indian grass, the kind they made baskets of. But come to think, the cows did chew what they ate, only a long time afterward. The milk farmer had told him that when they chewed their cud they were really not chewing tobacco, but the grass they had swallowed during the day. Richard turned to look at that cow by the fence. She seemed very lazy. Her back was black with vicious brown flies, yet her tail made slow loops over it, only disturbing a few silly young flies and not bothering most of them, and she didn't seem to mind. Huh! who *would* mind if he had a leathern skin? The boy looked at her huge pop-eyes. Very soft and gentle they were, nothing determined about them, and yet she ate as steadily as a machine and finished up one place before she moved slowly to another. He wondered why she didn't run from clump to clump the way he did when he was picking blueberries for mother. They were always better farther along, and if that were so of bushes, why not of grass? He turned over again, forgetting about the cow. His arms and legs were beginning to simmer. He was sure they were boiling, so he sat up to make an examination. Little beads of water sat like dew in the grass between the tiny white hairs on his forearm, which were signs that he was nearly a man. Where did all that water come from? He didn't drink very much and he hadn't had any that morning. Papa joked about the milk, like "the last page of *Puck*," his mother said, but then he knew that wasn't water, because he had watched it squeezed out of a cow and put thru the separator. He bent closer to examine one of the drops and he saw that it was curved just like grandma's reading glass. And that was a good thing to light fires with on sunny days when your matches were all moist in your pocket. Maybe that's what made his arms hurt; he'd ask father about it.

"Well, Sonny, are you trying to go to seed like a sunflower, or is it barbecue day?" asked a cheerful voice from behind.

"Hollo, Pop. Does the perspiration make burning glasses for the sun?" asked Richard, turning over and stretching himself like a dog before getting up.

"Well, I don't know that it's for the sun, exactly, but that's how you get burned, and tomorrow and next day while you're getting over it in bed you'll have time to figure it out. Come up here on the moss in the shade and I'll tell you a story old Guentham just told me. I think he's a romancer, but he says the story's true and that it happened to his cousin. When you grow up and want to hear interesting talkers, don't go to the city, where the newspapers set the topics of conversation, but go out into the woods or fields and you will find men who know more about things of interest, in which they profess not to be interested, than ever enter a city except to foreclose a mortgage or pay the largest share of taxes," said Mr. Dane, who was really repeating aloud what he thought might make a good opening for his next article. It didn't appeal to his red-membered son, and Dane was a bit crestfallen to see him hunting for tender wintergreen leaves among the moss and paying no attention.

When his father's "lecture" voice stopped Richard looked up and said:

"What's the story about, Pops?" and he moved nearer his father and put his arm confidingly about his shoulders. A streak of wet moss chips and sand remained on the clean white shirt when, a moment later, Richard decided *that* was uncomfortable, and lay down with his head upon his parent's knee.

"Are you quite ready?" asked Mr. Dane, after all the arrangements seemed to have been made. "Now, don't interrupt unless you don't like it, and if you don't like it I lose $150," said the author.

"Why?"

"Because I won't feel like writing it out if it doesn't make a hit," replied Richard's father, and thereupon began to tell how Mr. Guentham came into the possession of two ill-shapen, old-fashioned, cut-glass brandy bottles which he kept on his mantel shelf in his house behind the hill.

"Tell it in di'lect," ordered Richard, meditatively drawing his fingernail across his arm and wincing as the white streak glowed and vanished and pained.

"I wouldn't do that, Dicky," said his father, rubbing his own forehead with his finger-ends as he prepared to begin. "All right," he continued; "now don't interrupt." He paused and began again in what his son promptly interrupted to remark was his "cracked" voice. He was talking a New Yorker's best Yankee dialect.

"Them old glass jugs?" volleyed Mr. Guentham, when I asked him where he got them. "They *are* cur'us, *I* call 'em. Do you mind the tall ferns on 'em and the *deer*—well, I'll be danged, the man that cut them never *see* a deer. They belonged to my gran'ther, old man Borden as used to live in Burrville, but he didn't leave 'em to me. When he died his house burned up, or p'raps I should say, he died *when* his house burned up. They never found hide nor hair of 'im. I never saw 'im; I were a baby then. But aunt, that's my cousin's mother, she found these glass jugs in the cellarway where none of the burnt timber ends had happe'd to fall on 'em an' she took 'em home. When my cousin Mary grew up an' married *she* got 'em an' then she was took sick an' went abroad—consumption, always *were* a sickly gal.

"Her husband and she went to England aout in the moor country some'rs and there he met up with a feller he'd known in college. Oh, yes, he was educated. It were a lord or a duke or one o' them high-soundin' titles, tho they might not be no better 'n any one else. I guess he was what you call a viss count—that's higher than a common lord, ain't it?" (That is pronounced *vycount*, Richard.) "Anyways, he was as rich as Rockyfeller an' he had a big old castle—a thumpin' big one an' "—and here Mr. Dane's imitating voice became husky and mysterious—"it was ahaunted. Yessir, ther wan't no one as 'ud go anigh it 'cep in the daytime."

First interruption: "Pa, Mr. Guentham doesn't say 'anigh.' You're thinking of Mr. Baskedge," said lolling Richard.

"Well, never mind my words; listen to the story," reproved Mr. Dane.

"Oh, *I* don't mind, but you've *got* to," said the boy.

Mr. Dane was secretly pleased at his son's wisdom, untimely tho it was, so he merely continued in Guentham's voice and manner:

"Naow this lord—viss count, I should say—told John, that's Mary's husband, that he could live in the place rent free, if he *would* live in it. John an' Mary was both brought up in these hills an' they didn't have no fear of ghosts—has sparked on the swamp-medder road o' nights for all I know, most of us did—an' they jumped at the chance. It was a fine big castle, Mary wrote me abaout it——"

"Did it have a donjon keep?" asked Richard, looking off toward the weather-toned red silo. His father feigned absorption in his story and went on:

"An' she said it had a big tower" (the dungeon would be below that, Richard) "an' a great hall an' marble floors. Yessir, marble floors, Mary's my cousin, I said, didn't I? She got in some servants to work cleanin' up 'round, but they wouldn't nary one of 'em stay over nights. They was afraid of the haunts. Well, sir, one day she was walkin' in the cool ball-room lookin' at the marble floor an wonderin' what kings an' princes might have danced right there when all of a sudden she noticed a door, low hung along the wall. It was a half-door an' she hadn't never noticed it before. 'That's cur'us,' she thought, an' went over an' opened it. Inside was a little closet an' in this closet was two big marble balls, like might 'a' be'n on some fancy gate-posts. She looked at 'em an' then thought it would be fun to roll them over the marble floor, so she called John an' they rolled 'em. They made a mighty rumblin' noise in the high hall an' every one of those gosh danged servants screamed it was the ghosts an' ran out the house, I should say, castle. Well, when Mary went after them an' told 'em what it was they was ashamed an' come

back an' some of 'em even stayed over night.'

"What about those funny bottles, Pops," asked Richard, comfortably.

"That's what I wanted to know, but I knew I'd find out if I didn't ask questions and make interruptions, so *I* kept still," said his father, virtuously stressing his good example.

"All right, I'm sorry. Go ahead," said the boy, and again his father took up the thread.

"The next time I got a letter from Mary she told me abaout an' adventure. She were daown in the cellar one day lookin' at some old wine that had been buried under the cément floor, and that cément had been laid a good half century before. John had found it when he stubbed his toe in a crack in the cément an' kicked aout a piece. The wine didn't have no cobwebs on't, bein' buried in mud, but Mary says it was some of the finest she ever tasted an' must have be'n very old when the new cément was laid over where it had sunk into the soft ground. I don't know nothin' abaout strong drink—I'm prohibition. Anyhow she said it was fine," and Mr. Dane, with a twinkle in his eye that his son didn't see, smacked his lips. Guentham was a bachelor and his apples made good cider, as everybody knew.

"While they was alookin' to see if they was any more than eight bottles hid, Mary come on another secret door. It were in the foundation of the buildin' an' when they pushed on't it opened an' led into a narrow passageway. Mary's venturesome an' she stepped right in."

"I should think she'd 'a' bin scared," said Richard, sitting up and showing real interest for the first time. He liked to hear his father's voice and think about other things. It seemed to help him think when other people were talking. Other times he just "felt."

"I forgot to say," said Mr. Dane, "that Guentham said they had a lantern with them. Shall I go on?"

"Sure," said his son, in surprise. So he went on in his twanging imitation.

"They walked down the passage till it got steeper an' steeper an' they thought, at least Mary said she thought it was a —er—let me see, she wrote it—oo-bly-et-tea, whatever that is" ("I said I thought she meant oubliette") interpolated Mr. Dane and proceeded: "Yes, a sort of jumpin' off place, an' so she held onto John an' they went careful. The ground was wet an' finally she *did* slip an' John came pilin' down behind her an' both of 'em landed up to the ankles in ice-cold water. My, she was scared!

"Right there ther was a boat, an' they got into it an' begun to paddle slow. The water was still an' the passage was wider there an' it kep gettin' wider an' wider until they come to a big cave. An' what you think they found there? A whole set of counterfeiters' tools an' some counterfeit coins. She sent me one in th' letter."

"He showed it to me and it was a very good imitation of a British crown," said Mr. Dane, interrupting himself.

"Well, after they saw that they was a little scared, but they kep' on in the boat till they come to the river that flowed off in the medders below the castle.

"Well, sir, come to find aout, them counterfeiters were responsible for the ghosts. They used to come into the castle by the secret door an' go up to the ballroom at night, an' take them balls (she didn't mean that for a joke, Mary didn't, but it's funny how it happe'd, ain't it?) an' roll them on the marble floor to scare people away so they could have the place to themselves while they was amakin' money. She didn't say whether they ever caught 'em.

"Well, when she wrote me abaout all this an' I had her address, I wrote her an' asked her what she wanted I should do with them cur'us old brandy jugs, which she'd left at my place for safe-keepin'. An' she wrote back that I could throw 'em aout for all *she* cared, so I kep' 'em an' that's how I come to have 'em now."

Mr. Dane stopped and his son looked at him with what would have been called a quizzical expression had he been older than twelve.

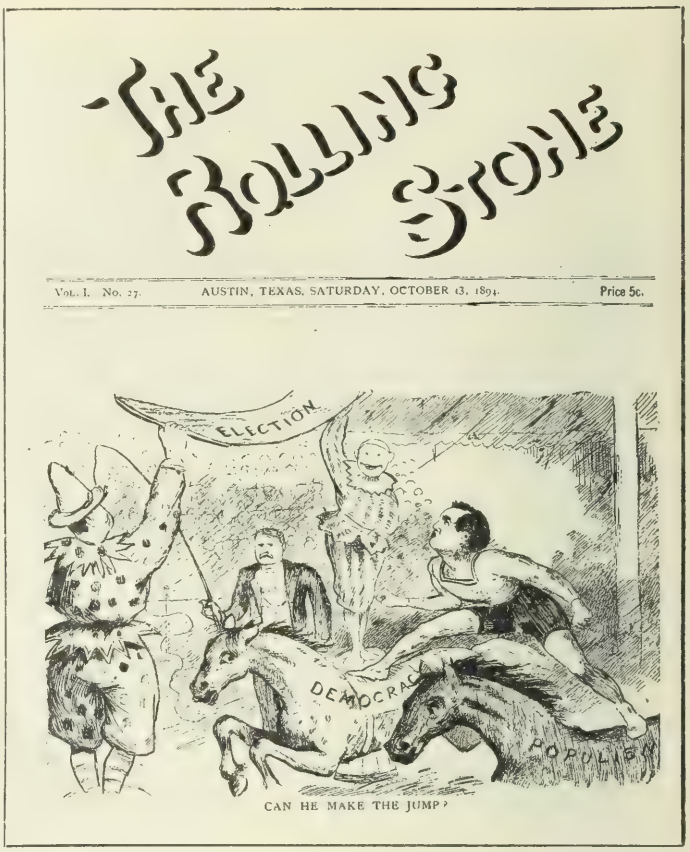
"That's just like 'ol' man Guentham,' isn't it?" he asked.

"Yes, isn't it?" said his parent. "And now I guess I smell dinner," he said, as he got up.

Which was an overdraft on the truth, since they were fully half a mile from home.

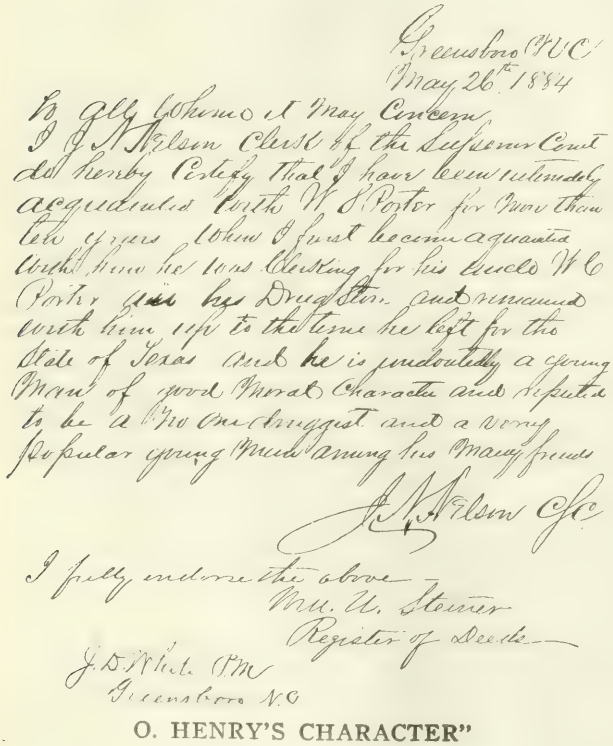
TARRINGFORD, CONN.

Some O. Henry Letters and the Plunkville Patriot



BY HARRY PEYTON STEGER

[The late Sydney Porter, better known as "O. Henry," is generally recognized both here and abroad as one of the most original and characteristic of American story tellers. Mr. Steger, his literary executor, made a trip to Texas not long ago in search of the early work of O. Henry and some of the material he gathered is here presented.—EDITOR.]



AS I think of O. Henry and my relations with him, there stands out one day in the early fall of 1909, when I crossed the hall from my apartment to his in the noisy Caledonia, on Twenty-sixth street, near Broadway, Manhattan. I went to urge him that he join his wife and daughter in North Carolina, take a long rest there, with them to look after him, and then begin the novel we had so often discussed. He was very serious that day and told me he had never had the leisure to write half so well as he thought he could. What kind of a novel he wanted to write he afterward outlined in a letter to me, that was found unfinished in his room after his death in 1910; but that day he did more than outline it. It was a rare thing for him to talk about his work—he usually pretended to bemoan the fate that had kept him from having a prosperous delicatessen shop—and I was wishing for a stenographer to record what he was saying, when suddenly he stopped short, smiled and said: "But why go to Asheville to write a novel? That's too far. You remind me of the man who said he was going to win the long jump in an athletic meet. He felt sure of it because he was going to take a three miles running start!" That conference of ours, with its unexpected conclusion, was so like the man and so like his stories that I count it among my most considerable memories.

He did go to Asheville, and later I joined him there. One day, as we sat in the back of a harness shop while a patriarchal old saddle-maker stitched up my

worn wallet, Porter pointed at a small county paper and said, "That looks like *The Rolling Stone*." As we walked back to the courthouse (our headquarters), he told me more of the paper he had written and published and generally illustrated under this title, back in Austin, Tex., some thirteen years earlier. Last year, after persistent searching, I found copies of *The Rolling Stone*. The search covered many weeks and many hundreds of miles. To me, the most characteristic feature of the paper was "The Plunkville Patriot," a page each week, or at least with the regularity of the somewhat uncertain paper itself, purporting to be reprinted from a contemporary journal. The editor of the Plunkville Patriot was Colonel Aristotle Jordan, unrelenting enemy of his enemies. When the Colonel's application for the postmastership in Plunkville is ignored, his columns carry a bitter attack on the administration at Washington. With the public weal at heart, the *Patriot* announces that "there is a dangerous hole in the front steps of the Elite saloon." Here, too, appears the delightful literary item that Mark Twain and Charles Egbert Craddock are spending the summer together in their Adirondacks camp. "Free," runs its advertising column, "A clergyman who cured himself of fits will send one

book containing 100 popular songs, one repeating rifle, two decks easywinner cards and 1 liver pad free of charge for 8 $. Address Sucker & Chump, Augusta, Me." The office moves nearly every week, probably in accordance with the time-honored principle involving the comparative ease of moving and paying rent. When the Colonel publishes his own candidacy for mayor, he further declares that the *Patriot* will accept no announcements for municipal offices until after "our" (the editor's) canvass. Adams & Co., grocers, order out their $2.25 ad and find presently in the *Patriot* this estimate of their product: "No less than three children have been poisoned by eating their canned vegetables, and J. O. Adams, the senior member of the firm, was run out of Kansas City for adulterating codfish balls. It pays to advertise." Here is the full editorial in which the editor first announces his campaign: "Our worthy mahor Colonel Henry Stutty died this morning after an illness of about five minutes, brought on by carrying a boquet to Mrs. Eli Watts just as Eli got in from a fishing trip. Ten minutes later we had dodgers out announcing our candidacy for the office. We have lived in Plunkville going on

GONE BEFoRE.

JaBez Sidebothem, our most prominent dealer in hides and futures succumbed on the 23' to the inevitabel; and leaues a widow to mourn his loss. Sucq howevr is Jabez's gain.

I will miss pou ƒabez, miss you
When the stars begin to shine,
In fact it will be hard to get along without you
But I will have to be resign-

Xou will wait for me in heaven
Just with in thepearly gates.
He died just a vuarter past seven
But Providence rules our fates

But true hearts death cannot sever.
There neuerwas a kinder man,
I never expect to do better ever;
But I.ll try and do the best I can

The minerable ,subsidyid, cowarkly' lying sycophantic parasite who disgraces the editorial chair of the Plunkville Heralp, has spread the report that we tried to commit suicide last Friday night. It is true that we drank about four ounces of embalming fluid at the Palace Drug Store, but we did so in good faith supposing same o be rve whiskey. We are not ready to commit suicide yet' but woulb think very seriously of it if we wereas worthless, degraded and depraaed as Col. (?) Montmorency(?) of the Herald. We suffered no inconvenience from the mistake we mape beyond a slight pain in the gastric region, and a somewhat awkward thirst which we found trouble in satisfying. We hereby warn the editor(?) of the Herald that if we see proper to daink nitric acid or melted lead in the future we want no coment from anp will promptly resent same.

Dr. Hoffer, a rising young physician of Plunkville; has gone on a short trip to New Orleans. Dame rumor has it that he will not come back alone. as the requisition papers were made out yesterday

out at third, but the umpire refused to change the decision. Dr. Shallenburger thinks the wound not serious.

five years and have never been elected anything yet. We understand the Mayor business thoroughly and if elected some people will wish wolves had stolen them from their cradles. . . ."

This page from the *Patriot* is presented with an array of perfectly confused type, of artistic errors in setting up, and when an occasional line gets shifted (intentionally, of course) the effect is alarming. Anybody who knows the advertising of a small country weekly can, as he reads, pick out, in the following, the advertisement from the "personal."

Miss Hattie Green of Paris, Ill. is

Sachet powders Mc. Cormick Reapers and
oysters.

All of this was a part of *The Rolling Stone*, which flourished or at least wavered in Austin during the years 1894

O. HENRY ON VACATION

and 1895. Years before he made this incursion into journalism, his native desire to write was gratified in letters. In 1883, when he was in his twentieth year, he wrote back from West Texas to Doctor Beall, of Greensboro, N. C., telling of his life on a sheep ranch. The letter has much of the exuberance that marked his later work. Here it is:

LaSalle County, Tex., Feb. 27, 1884.

My Dear Doctor—Your appreciated epistle of the 18th received. I was very glad to hear from you. I hope to hear again if such irrelevant correspondence will not interfere with your duties as Public Health Eradicator, which I believe is the office you hold under county authority.

If long hair, part of a sombrero, Mexican spurs, etc., would make a fellow famous, I already occupy a topmost niche in the Temple of Fame. If my wild untamed aspect had not been counteracted by my well-known benevolent and amiable expression of countenance, I would have been arrested long ago by the Rangers on general suspicion of murder and horse stealing. In fact, I owe all my present means of lugubrious living to my desperate and blood-thirsty appearance, combined with the confident and easy way in which I pack a Winchester rifle.

You are right, I have almost forgotten what a regular old, gum-chewing, ice-cream destroying, opera ticket vortex, ivory-clawing girl looks like. Last summer a very fair specimen of this kind ranged over about Fort Snell, and I used to ride over twice a week

on mail days and chew the end of my riding whip while she "Stood on the Bridge" and "Gathered up Shells on the Sea Shore" and wore the "Golden Slippers." But she has vamoosed, and my ideas on the subject are again growing dim.

If you see anybody about to start to Texas to live, especially to this part, if you will take your scalpyouler and sever the jugular vein, cut the brachiopod artery and hamstring him, after he knows what you have done for him he will rise and call you blessed. This country is a silent but eloquent refutation of Bob Ingersoll's theory; a man here gets prematurely insane, melancholy and unreliabe and finally dies of lead poisoning in his boots, while in a good old land like Greensboro a man can die, as they do every day, with all the benefits of the clergy.

Later on he came from the western part of the State to Austin. He lived there with the Harrells. Once, when David Harrell, a youth of his own age, went West, Will Porter followed him with letters that told the gossip. Here is one:

Austin, Texas, Dec.'22, 1885.

Dear Dave—Everything wept at your departure. Especially the clouds. Last night the clouds had a silver lining, three dollars and a half's worth. I fulfilled your engagement in grand, tout ensemble style, but there is a sad bon jour look about the thirty-eight cents left in my vest pocket that would make a hired man weep. All day long the heavens wept and the heavy somber clouds went drifting about overhead, and the north wind howled in maniacal derision, and the hack-drivers danced on the pavements in wild fierce glee, for they knew too well what the stormy day betokened. The hack was to call for me at eight. At five minutes to eight, I went upstairs and dressed in my usual bijou style, and rolled away to the opera. Emma sang finely. I applauded at the wrong times, and praised her rendering of the chromatic scale when she was performing on "C" flat andante pianissimo, but otherwise the occasion passed off without anything to mar the joyousness of the hour. Everybody was there. Isidor Moses and John Ireland and Fritz Hartkopf and Prof. Herzog and Bill Stacy and all the bong ton elight. You will receive a draft today thru the First National Bank of Colorado for $3.65, which you will please honor

There is no news, or there are no news; either you like to tell. 1008 Lavaca street is very happy and quiet and enjoys life, for Jones was sat on by his Uncle Wash and feels humble and doesn't sing any more, and the spirit of peace and repose broods over its halls. Martha rings the matin bell, it seems to me, before cock crow or ere the first faint streaks of dawn are limned in the eastern sky by the rosy fingers of Aurora. At noon the foul ogre cribbage stalks rampant and seven-up for dim, distant oysters that only the eye of faith can see.

The hour grows late. The clock strikes! Another day has vanished. Gone into the dim recesses of the past, leaving its misspent hours, false hopes, and disappointed expectations. May a morrow dawn that will bring recompense and requital for the sorrows of the day gone by, and a new order of things when there will be more starch left in cuffs and collar, and less in handkerchiefs.

Come with me out into the starlight night. So calm, so serene, ye lights of heaven, so high above earth, so pure and majestic and mysterious; looking down on the mad struggle of life here below, is there no pity in your never closing eyes for us mortals on which you shine?

Come with me onto the bridge. Ah, see there, far below the dark, turbid stream, rushing and whirling and eddying under the dark pillars with ghostly murmur and siren whisper. What shall we find in your depths? The stars do not reflect themselves in your waters, they are too dark and troubled and swift! What shall we find in your depths? Rest?—Peace?—catfish? Who knows? 'Tis but a moment. A leap! A plunge!—and—then—oblivion or another world? Who can tell? A man once dived into your depths and brought up a horse collar and hoop-skirt. Ah! what do we know of the beyond? We know that death comes, and we return no more to our world of trouble and care—but where do we go? Are there lands where no traveler has been? A chaos—perhaps where no human foot has trod—perhaps Bastrop—Perhaps New Jersey! Who knows? Where do people go who die in McDade? Do they go where they have to fare worse? They cannot go where they have worse fare!

Let us leave the river. The night grows cold. We could not pierce the future or pay the toll. Come, the ice factory is deserted! No one sees us. My partner, W. P. Anderson, will never destroy himself. Why? His credit is good. No one will sue a side partner of mine!

You have heard of a brook murmuring, but you never knew a sewer sighed! But we digress! We will no longer pursue a side issue like this. Au revoir. I will see you later. Yours truly,

William Shakespeare, Ingomar Junius Brutus Calliope, Six-Handed Euchre, Grover Cleveland Hill City Quartette Johnson.

I found, on my journey over his Texas trails, a lot of interesting material, cartoons, verse, early stories and many, many letters, a representative collection of which I am publishing this fall in the last volume of his work, "Rolling Stones." New things are turning up about him every day. He had but ten years of fame while he lived. It remains to be seen how many yet remain to him after his death. I respectfully refer this to posterity.

Garden City, L. I.

E. PHILLIPS OPPENHEIM, HIS WIFE, AND HIS DAUGHTER AT "WINNISIMMET"

E. Phillips Oppenheim at Home

BY HERBERT FRANKLIN JENKINS

"We do not stop to inquire into the measure of his art any more than we inquire into that of Alexander Dumas; we only realize that here is a benefactor of tired men and women seeking relaxation. He is an entertainer pure and simple, so delightful a companion that even a surfeited professional reviewer welcomes a new book of his with the confident expectation of pleasure. We do not care whether the underworld into which he leads us bears any relation to reality or not, he captures our attention in the first chapter, and thenceforth we are his until the end is reached. We are in a world of his own, and he makes us interested onlookers at its romantic and adventurous doings."—*From an* INDEPENDENT *review of one of E. Phillips Oppenheim's novels.*

DESPITE his productiveness—and already this year he has had published two novels, both of which became "best sellers"—E. Phillips Oppenheim is not a syndicate. A recent visit to his comfortable English home disclosed this so-called "prince of story tellers" as a systematic, industrious worker.

After years of industry the creator of "Peter Ruff," "Mr. Sabin" and a score of other fascinating characters has developed the skill to write his two or three full fledged novels, together with a dozen or more short stories, each year, and still have ample time for golf, for shooting, and for travel abroad.

Mr. Oppenheim's methods are simple. Seated in his library or pacing the floor, he dictates his stories, as they unfold themselves, to his efficient secretary, who takes them down in shorthand. These notes are transcribed by means of a typewriter and from this rough draft Mr. Oppenheim then dictates a revised version. The latter is subject to inevitable changes. No time-consuming long-hand writing for E. Phillips. "Many a time earlier in life," he says, "when I used to write my stories with my hand, I found my ideas would come so much faster than my fingers could work that I prayed for some more speedy method of transmission. Then I found a jewel of a secretary and the problem was solved. Whereas many of my fellow writers have told me that they found it impossible to dictate satisfactorily, I myself, from the very first moment, found it by far the most effective method of getting my work on paper. Thus only about half of my time is devoted to writing or dictating, so that the other half is available for exercise and sport, visits to London, and travel."

Morning for work, afternoon for golf, and evening for auction bridge is the typical program of the novelist when he is at his home in Sheringham—an ideal spot on the Norfolk coast, overlooking the North Sea, with excellent golf links within a few yards. The exceedingly modest Oppenheim home is called "Winnisimmet," the Indian name for the city of Chelsea (Mass.), which was the former home of Mrs. Oppenheim. It was a score of years ago that the young novelist, then unknown in this country and merely a serial writer in England, met Miss Elsie Hopkins, the daughter of a Massachusetts manufacturer, on the Con-

MR. OPPENHEIM AS GOLFER

MR. OPPENHEIM AT WORK

tinent, and shortly after followed her to her home in Greater Boston, where the marriage ceremony was performed. A daughter of fourteen is now the life of their country home.

The son of an English business man, young Oppenheim had ample opportunity to enter a commercial pursuit, but he just naturally took to writing. "I frankly admit I do not know why," he confest. His first short story was published when he was eighteen, and he was only twenty when his first novel appeared. Now at forty-five he sits down to commence a new story "with exactly the same thrill as at twenty," to quote his own words, and perhaps that explains in a measure his continued popularity. "I don't think there is another profession in the world," he adds, "which maintains its hold upon its disciples to such an extraordinary extent."

Altho he has visited most of the European countries and has been to the States a dozen times, Mr. Oppenheim asserts that so far as actual influence upon his work is concerned, he would be content to spend the rest of his days in London.

"It is no gift of mine to impart reality into scenes and events placed in a country in which I have not lived. Half a dozen thorofares and squares in London, a handful of restaurants, the people whom one meets in a single morning are quite sufficient for the production of more and greater stories than I shall ever write. The real centers of interest seem to me to be the places where human beings are gathered together more closely, because in such places the great struggle for existence, whatever shape it may take, must inevitably develop the whole capacity of man and strip him bare to the looker on, even to nakedness. My place as a writer, if I may claim one, shall be at the corner of the market-place."

London it is that forms the background of the greater portion of most of his popular successes. The Savoy Hotel, where he lives during his frequent and prolonged visits to the metropolis, often appears in his books as the "Milan." At one time he introduced the maître d'hôtel as a villain, without disastrous results. One of his clubs is the Savage, and at one of the Saturday night club dinners, over which he presided, Mr. Oppenheim vastly amused his fellow members by reading a rimed "roast" on himself. This poem, of American origin, began as follows:

"I have read your latest book, Oppenheim,
It involves a swarthy crook, Oppenheim,
And a maid with languid eyes
And a dowager who sighs
Oppenheim, Oppenheim,
And your glory never dies, Oppenheim."

At a recent London banquet he was asked for his American impressions. The incident that most appealed to Mr. Oppenheim's sense of humor was this: "I was riding in the train from New York to Boston," he said, "when a newsboy with a stack of new books in his arms asked me if I did not want to buy the new novel by Oppenheim. I told him I had read it. He appeared incredulous, as it had just been published. I admitted that I was the author. The boy deposited his stock of books on a nearby seat, came over to me smiling, shook my hand, and said, 'How do you do, Mr. Oppenheim. I am awfully glad to meet you. I have often wished I could have the pleasure.'"

Outside of his work and his family Mr. Oppenheim most enjoys golf and shooting, auction bridge and the theater. He has not succumbed to motor cars but he is perfectly sure that he has written an excellent play and could write others—"If I could only imbue some responsible manager with the same idea," he says. Notwithstanding his fame and pecuniary reward as a popular novelist he will never be quite content until his name is associated with a dramatic success.

BOSTON, MASS.

The Wonder of the Word

BY CHARLES F. LUMMIS

IT is admirable how in the earlier days men made expressive words, and tuned the sound to fit the sense. How much we have lost the art is indicated by our failure to recognize the tune when we hear it. We talk, indeed, about "color tones" in music, and many other patter-words; but we haven't the ear nor the eye that less busied folk used to have. And our words of modern coinage show it. What "air" or what image is carried by "telegraph," "engine," "automobile," or by most other words of later invention? What does "steamboat" *look* to your ear? Yet "steam" is itself a word of the older musical adaptedness—with the sibilance, the compression and yet the open voweling that befit. The composer recognizes certain shades of tone, pitch and accent as inevitable to the musical expression of mood.

Take words like "buzz," "hiss," "c r a c k," "thunder," "reverberate," "splash," "roar," "whisper," "squeak," "squawk," "groan," "chuckle," "sneeze"—and there are a thousand of them. Sound them round and smartly—and see if they have not what you might call a "visible meaning." A person who did not know a word of English would get some image from any one of them, rightly spoken.

Speech is an instrument not only of music but of other precision. It has pierced more hearts and brains than all the other weapons put together in all the world's history. Clear thought provides clear speech; thought not only clear but serene finds utterance musical as clear. You cannot really remove your mind from proximity to your eyes and ears. If you let it use them, it *will* use them—it will apply to its own functions their sense and their common sense. Nobody sings false on purpose, nor looks cross-eyed of malice prepense. Yet most people sing inexactly, see vaguely, speak spattering, think by guess—just out of slovenly habit.

Rime, rhythm, alliteration, euphony; they all, and many more, count in the one universal chance for melody—like harmony and counterpoint. The very first step of man toward any vocal music whatever—and particularly toward adapting his original grunts to something singable—was the onomatopoetic word. And that's a bad one! I know Greek to be a

means of grace for boys from eight to twenty-three; but after that we have troubles of our own.

The "sense-sounding word." But *that* is not good music! Let us say "the sense-telling word," or, "the picture-word."

The more we think of it, the more we realize that most of our old, stock words are apt—not merely because we are used to them, but because they fit like a skin on the things they name. If we had grown to maturity with every other experience, but had never heard a syllable, do you think we would coin a word like "slap" to denote tickle, or "crack" for a rustle, or the wavy "gallop" for the hard trot? Would we describe a hush by "slam-bang," or say "slam-bang" when we wished some one to "sh-h"?

What does "wireless" mean to you? Why, a telegram. What does "telegram" mean? Why, collect. But *wire*—just strum on it awhile! Would any other vowel but the longest and most tenuous fit there?

If you were making a language, could you possibly think of "flutter" to indicate calm? Or "rollicking" as a title for repose? No dictionary on earth knows why we call it "butterfly." The sagest say, mebbe, because some are yellow like butter! But this is an oleo guess. We are victims of a transposition. The real word is flutterby—which meets all tests of onomatopoeia, natural history and daily use. "Butterfly" indeed! That would be all right for hot biscuits, but it's absurd for the most volatile form of life. The very *b* at its head "impossibilitates" it. No explosive consonant can flit. Just try to think of any Anglo-Saxon word, beginning with *b*, that means floating, fluttering, flying, or any other release from the ground!

The more one learns of other languages, the more one suspects that English is neither the first nor the only one. All of them had—at least originally—the musical ear and the eye of precision. They all were definitive; they all were in tune; they all practised onomatopoeia—with no dream what a dreadful name it had.

It's a great game—the old game of words "fitly spoken." Logical sequel of the universal sign language, it has grown far greater than its origin. It gives not only significance but music. It gives harmony to thought and sound. Speech is the chief asset of man (embracing woman). It is the last property he (or she) would surrender—not even excepting fire. It is the only proved immortality—Homer's words have outlived the marbles of Phidias; and the laws of Moses will still be alive enough to be broken when the Pyramids are gone to dust.

So, it's a game that is really worth learning. No one would "last long" who should play bridge as most of us play words. Such malfeasance of a piano as we indulge upon the nobler instrument would fetch us before the court for disturbance of the peace. Such fiddling of firearms brings thousands of deaths a year; but we murder the mother tongue hourly, just because we, too, didn't know it was loaded.

Our fitful old genealogies are not, even for us, half as interesting, a thousandth as old, a millionth part so important. The Genesis of Words is the first book of the Bible, not alone of culture but of modern efficiency. The sweep, the swing, the flow, the attunement of speech, it's singing as it goes—but singing like the bullet to its mark—much as we need a symphony once a month, we need these every five minutes between the break-o'-dreams and the going back unto them. If our 450,000 dictionaried words and our very pick of them—and our right, title and interest to make new ones as we need—are no more comfort to us than a catgut *in situ* and not strung to tune; just to petition for a passing of potatoes, just to jabber for time-killing—we are poor indeed. Three hundred vocables would be liberal fund for that. And I never starved in lands where my whole vocabulary was my hands and a desirous expression.

Language is not alone for bread and butter, the grindstones and the smirk. It is the tools of graving, dissection, construction; a two-edged sword, a long-range rifle; the makings of what Babel would have been if they had fitted the stones—a tower to shiver the skies. It is a song, a flower, a poem. It is feet, but it is also wings. Why treat it as a "caller" when it comes as a friend?

Los Angeles, Cal.

A Labrador Adventure

BY WILFRED T. GRENFELL

[Dr. Grenfell needs no introduction to American readers for they are familiar with his work for deep-sea fishermen in establishing hospitals, co-operative stores and missions in Labrador. In the following pages he narrates one of his boating experiences none the less interesting for being true.—EDITOR.]

NOVEMBER had already come in, and my small hospital steamer had gone south to be laid up for the winter. We had let her go rather early this year, in order to cut down expenses a bit, and also because the early frost in the fall threatened to make a delay risky.

But she had scarcely left when the weather slacked up; a warm wave dispelled the ice which had already begun to form in the harbors, and we felt free to risk the final series of visits among our friends scattered along the southern coast of Labrador and the north shore of Newfoundland. Motor boats were still comparatively new everywhere, but with us in the extreme north were absolutely novel. We had purchased one from a party who had come to visit the coast in a large cruising yacht. They had parted with it as they passed homeward. We had not expected to use it until spring, and the new toy was already on improvised ways, ready to be hauled up above the reach of the rough "ballicater," or barricade ice.

But the desire to test her, the "warm spell," and a somewhat urgent call for help decided us to risk a voyage. Moreover, one of my colleagues, Dr. Wakefield, an Englishman from Kendal, had to catch the last mail boat leaving the Labrador coast in order to get to Canada.

Our little craft, an open thirty-footer, was well loaded down when at last we rounded the heads, every available space being crowded with spare supplies of gasoline, as none could be procured on the journey, and we had at a minimum two hundred miles to travel. With our own supplies for a week, guns, spare gear, medical outfit, not only was there barely room to move about, but a large pile was lashed out over the cuddy and covered with a tarpaulin. My engineer was a volunteer student of McGill University, who had studied mechanics, and was the only one of us who had ever seen a gasoline engine.

All went well until evening; so well, indeed, that near Cape Bauld, the mighty cliff which, jutting away out into the Atlantic, marks the southern entrance to the Straits of Belle Isle, we were tempted to spend a little time in chasing a few ducks, which would be a welcome addition to such meals as we could at best expect on our journey. Calculating that our boat would run well for at least one day, we had left ample time to reach a harbor by dark, and were merrily traveling past the feet of the great cliffs that flank the seaboard for the last ten miles before our destination, when suddenly something went wrong. The engine stopped and absolutely refused to start again. For the first time we noticed now that a wind was rising which was blowing directly on shore, and that we were being rapidly carried into the heavy surf, which was breaking on the rocks. To get the sweeps out from underneath the baggage was no easy matter; to find room to row, even enough to keep us from drifting shorewards, was almost worse, and the sea was far too deep to dream of anchoring. We could no longer even keep our bow to wind, and the rising lop made us crawl along at an angle of 45 degrees with the cliffs, with the wind driving the spray over us, and the prospect of an exceedingly bad time ahead. In addition, it was getting dark, and our amateur engineer, who had by now pulled the engine into most of its component parts, was finding some difficulty in putting it together again.

It was a thick night, and darkness found us still pulling at the sweeps, to all intents and purposes in the same place in which we started with them. Indeed, we were unable to feel certain that

we were making any headway whatever. On the off chance of some one hearing us, every now and again we fired a couple of shots, but it is a very lonely part of the coast, and almost as we had expected, nothing happened as a result. At length, however, a white light suddenly appeared away toward the horizon, and by its bobbing up and down, and its evident progress over the water, we judged it was a local coasting schooner, beating up the Straits. Some of these boats are careless about such trifles as side lights after the fishing fleet has gone south.

With the high cliffs behind us as a reflector, we hoped that the sound of our firing would reach her. Indeed, we felt sure of it, for the light came nearer and nearer, while we pulled and strained at the oars to try to head her off. We had now lighted our hurricane lamp, and as we doubted whether they could tell whence the sound came, every now and again one of us left his oar for a second to jump up and down and wildly wave the bright white lantern.

Straight on came the light. We had already begun to banter and chaff our engineer, who was still struggling with the greasy fragments of the engine, giving him our free and unasked opinion of his capacity, his utility, and even his personal appearance. At last we judged that the schooner was so close to us that we actually tried to hail her, shouting in unison, "Schooner ahoy! Schooner!" when, without a moment's warning, the advancing light suddenly disappeared, and disappeared not to return. We fired and fired our gun and waved and waved our lantern; we strained our eyes into the darkness, and nearly drove ashore by forgetting to keep our oars going.

All to no purpose. The light had gone. The only explanation which we could conceive was that it must have been a ghost which we had seen. We had heard stories of these gloomy cliffs before; of vessels which had been lost in the old times; of pirates and their victims who had perished together, as they fled to their strongholds among these intricate and uncharted passages on both sides of us. Right close to this spot Jake Cornish was even now using as sinkers for holding his trap nets two old cannon which he had spied with his fish glass, lying on the bottom, as he was searching for bait. Tho none of us believed in ghosts, we were utterly at a loss to account for the strange light and its unearthly disappearance. Surely, if it was on a schooner, she must have seen our light and heard our guns. It could not be that we were crazy and were already "seeing things!" The only relief to the situation was the cheerfulness of Dick, our engineer, who went on placidly struggling with his fragments, and even found time to chuckle at us for getting left.

He pretended not to be in the least interested in our consternation, and took absolutely no notice of us whatever. He just went on tinkering with his miserable collection of uselessness, till if it had not been for his newly enhanced value, of which he was quite conscious, he certainly would have been in danger of a stir-up from the oar handle.

We hated to come down first, and just sat "tight" for a while, rowing and rowing away. No one would mind that. We could, and had before now, rowed all night. But it is a different matter when you know you are getting nowhere, and Dick knew that we dare not ask him to leave his scrap heap and give us a spell. It is always additionally irritating to have a hearty, strong man doing nothing to justify his weight in the boat, when you have already done more than double your share. Dick aggravated us even further now by lighting his pipe, and wiping the engine round with a handful of waste, as if he were going to put her in for a prize competition.

At last even we could stand it no longer, and had to insist that he must either get the thing started or come and take a spell at the oars, as we should surely be drowned if we stopped working.

"She's been ready for half an hour," he replied; "I was only waiting for orders," as cool as a cucumber.

True, he was young, and had supreme confidence, also he was probably not born to be drowned; but for my part it was with no small anxiety that I watched him crank the engine to try and start her. We had some miles to go, and the wind might increase, and if it did

we should most assuredly drive ashore on the cliffs in the darkness. Bang! bang! went the charge in the cylinders, as if they highly resented being prest into service again. Bang! bang! and away we went at the topmost speed of the engine.

We headed straight out to sea to give ourselves as much sea room as we could get in case any other accident overtook us. Indeed, it was as well we did, for after about three minutes at full speed there was an ominous gur-r-r again, and once more we lay broken down and at the mercy of the waves. Once more we had to get out the oars to try to hold the ground which we had gained, while Dick went thru his pantomime all over again.

This time, however, Dick volunteered his diagnosis somewhat sooner. One cylinder was suffering from an incurable ailment, but if we were willing to try running on our battery, and so spoiling our trip, he thought we might crawl along to the harbor, if it was not too far away.

We were more than willing to try anything. All we wanted was to reach shelter and get out of the scrape, for it was bitterly cold and we were already soaked thru. So we fell to encouraging Dick; explained how mistaken we had been in our estimate of him, and gave him all the psychological treatment of which we were capable. To our infinite satisfaction we were soon poking along, puffing and wheezing and blowing, as if the engine were suffering from double pneumonia.

Twice again it gave out before we rounded the last headland. But we had pushed away out to sea in spite of the increasing lop, and so each time we were able, by hoisting an improvised sail on the oar and stretcher, to keep her heading in for our destination.

When at last we were in quiet water we found it too deep to anchor, and spying a tiny light on the water, we pulled over to it and discovered that it was issuing from the hatch of a small schooner. So we tied on and went aboard.

"Where are you from?" came a gruff voice as we hauled the cover off the companion previous to making a descent upon the occupants.

"We? We are from sea, and are going to get beds ashore, if we may tie our boat on."

"Come on down," shouted the voice. And then some one struck a match and rolled out on to the settle from a bunk.

"Which way did you come from? From east or west?"

"What makes you ask?"

"Well, us just comed in ourselves from t'east. You'se didn't see nor hear no craft as you passed down, did yer?" he asked, peering at me intently as he spoke.

"No, we didn't see any vessel. But we saw a light come right up alongside of us, and then disappear."

I noticed towsly heads poking out of the other two berths as I spoke, evidently keenly eager not to miss a word of the conversation.

"I know'd as much," said the skipper. "I seed it there myself once before. Mary, she always did 'low us should give them Deadmen's Rocks a good berth. And maybe they do know a thing or two," and the skipper lapsed into a silence and a cloud of smoke, the blowing out of which seemed to afford him some solace.

There was silence for a moment and then the skipper began again.

"You'se didn't hear no noises, did you? Seemed to us there was folks shouting. They do say they hears some of them folks on times what's been lost there—maybe murdered. It was our Dave's watch last night about ten o'clock. He's always kind o' skeery, anyhow, and he was fair clemmed to death when he heard 'em."

"What did he do?" I asked, beginning to take in the situation.

"Why, he doused the deck light, and put her all about for the open. And that's how us came to be in here at all."

Here was an explanation in full of our own desertion. I looked round and saw the staring eyes of Dave fixed on me like a mesmerized rabbit.

I said: "Well, skipper, an old friend of mine called Darky Jim was like Dave once. He believed in ghosts, too, he said. But he doesn't any longer. He told me he was on watch one night alone. It was just after midnight, black as ink, and blowing a two-reefer. They were

'hove-to,' waiting for daylight. He was standing aft under the shelter of the mizzen, jumping up and down to try to keep warm, when he saw a bright light for'ard by the cathead. Suddenly it began to move slowly aft toward him, and he was so frightened that he hid behind the companion. Well, the light came right on and then he knew it was a figure walking. At last he saw it was his wife. When she came to the ship's quarter she just climbed up on the rail, and with a loud shout she jumped over into the sea. Of course, Jim thought that meant that she was dead, and he told the crew he ought to run the vessel home. But that was all put on, really, for Jim's wife was famous for the dance she led him, and quite possibly Jim wasn't a bit worried at the news. But the trouble was, he told me, that when he got home there was no such luck. 'Why, Doctor,' said he, 'I found the old lady waiting for me with the broom handle, just as usual. So I give up believing in ghosts. I never trusted them after deceiving me that time.' "

Then I just told Dave all about our shouting and firing and waving the light under the cliffs. And before I bade him good night I advised him the next time he was in doubt to call the skipper.

ST. ANTHONY, NEWFOUNDLAND.

Remembrance

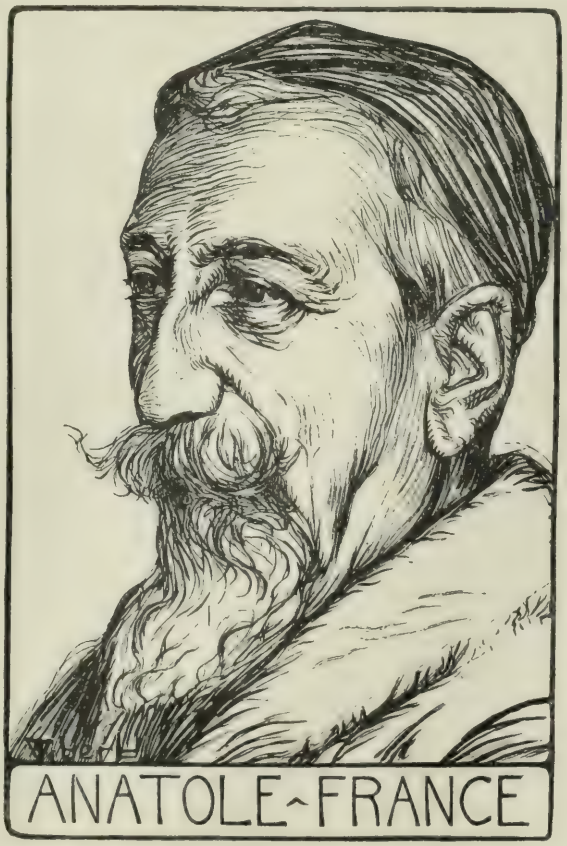
BY GEORGE MEASON WHICHER

OMAR is dead, who loved so well his wine;
Above his mouldering grave the roses twine.
And Horace now—for all his Golden Mean—
Is nameless dust upon the Esquiline.

It matters not, or sad or glad the strain;
Each poet sings his hour, nor comes aga'n.
Whate'er he was or had or hoped is gone;
His songs alone immortal may remain.

Ah! what will be, my friend, for you to guess
Of me, who pass to utter nothingness?
Who have no voice to echo in your heart
When death shall make my present little less?

Then whensoe'er you turn the pages thru
Where smiling Horace bares his heart to view—
When Omar's muted strings wake sweet regret—
Turn down the leaf and think: *He loved them too.*



NEW YORK CITY.

Anatole France as Historical Novelist

BY WARREN BARTON BLAKE

ANATOLE FRANCE, creator of the gentle Bonnard and the too intelligent Bergeret, has written an historical romance. One may enquire, therefore, what is this master ironist's notion of history and what is his theory of romance?

The Frenchman no doubt agrees with the rest of us that a romance is a narrative in which love plays its part; a narrative whose facts need be proved by no other tests than those of effect (is it amusing? is it pleasing?) and plausibility (is it possible? is it believable?). Some will add—but not the author of "Thaïs"—that there is also a test of morality.

A history (so, in his book-reviewing days, M. France once wrote) is a representation of past events. Not every fact constitutes an event, however. It is only the notable fact that counts; the historian himself being the judge of its notability. "He judges it arbitrarily, according to his taste and his caprice, by the test of his intelligence; as an artist, finally, since facts do not classify themselves, of their own accord, into historical and non-historical facts." Also, a fact is something extremely complex. The historian must simplify it. (Just so must an historical novelist simplify and interpret.) Stripping the historical fact of its particularities and details, no wonder if he innocently falsifies it! But in this case, of what value is the historian's work? We except, of course, the "scientific" historian, whom no one reads unless the fellow scientist. M. France pays his respects to the brotherhood in the preface to his malicious "Penguin Island."

Now, we may make a useful deduction from all this. The classic objection to historical novels has been that, whereas history represents truth, the novel seeks only to create a land of faery. The union between these two genres was bound, therefore, to produce a bastard. But, if the historian who aims at truth has no real chance of bringing down his game, what harm can there be in historical romance? It is surely no worse than the other varieties of history and biography; perhaps, even, it is a shade more innocent—since it is less pretentious.

The historical novel by M. France which may serve as the excuse for these ruminations, and paraphrases of M. France himself, is in one sense not the author's first; it is, however, his first to deal with the events of the French Revolution. He calls it "The Gods Thirst"—*Les Dieux ont Soif*.* And let us begin by praising M. France for sparing us historical portraits. The great figures of the time cross its stage scarcely more often than they enter "La Rôtisserie de la Reine Pédauque," which they don't enter at all. Even when the revolutionary "gods" do make an appearance, one is hardly conscious of their greatness. Neither is M. France.

This Academician is, as we all know, an arch-skeptic. He has been called the

*Les Dieux ont Soif. *Par Anatole France*, de l'Académie Française. Paris: Calmann-Lévy.

French Sterne, the Parisian Swift, the twentieth-century Voltaire. Tho (or because) his work is full of all that has preceded it (M. Lemaître's phrase), and would be inconceivable save as the flowering of a dead-ripe civilization, he is skeptical, not only as to the value of historical scholarship, but also as to the value of all human effort. He is equally skeptical where religion is concerned, and seems persuaded of man's incorrigibility. Most provoking, most corrupting of all, he smiles at the world in spite of all his skepticism, and seems to think it not so bad a world at that. Indulgence founded upon contempt is behind that wonderful smile—which, like Mona Lisa's, fascinates those whom it does not exasperate. For myself, I am successively captivated and repelled. . . .

Now, there are all manner of humorists; it is the rarest type that includes the humorist himself and his favorite causes in the mocking. So it is with skeptics; and is there not, commonly, a basis of skepticism in high humor? As a revolutionist on his own account, M. France might be expected to pay his tribute, in "Les Dieux ont Soif," to the revolutionary idea, to the original French revolutionaries. Not at all. The enthusiasm of the Dreyfus days is spent —the heat of Socialist propaganda cooled. The incorrigible and smiling pessimist recurs to the point of view of the dissolute abbé who has figured in two of his earlier books—Messir Jérôme Coignard, *docteur en theologie, licencié ès lettres.* Coignard once complained: "The folly of the Revolution was to wish to institute virtue on the earth. When one seeks to render men good and wise, free, moderate, generous, one is led fatally to wish to kill them all. Robespierre believed in virtue, he produced the Terror. Marat believed in virtue; he demanded two hundred thousand heads." The paradox of this unchurchly abbot remains the idea of M. France in writing his novel of the French Revolution. It is exprest this time, in different language, by the old libertine, Maurice Brotteaux des Ilettes, ex-farmer-general, who is reduced to carving wooden dolls in a garret—thanks to the Revolution and the Rights of Man. Thus his mouthpiece is—to drop into popular jargon—a "reactionary." Yet M. France shows no signs of going over to Catholicism and the Camelots du Roi."

"Very well, then," you say to yourself, "in this novel of his he doubtless gives free rein to the period he seeks to represent. Without undertaking to make the revolutionists heroes and the royalists villains, he finds it possible, in his romance, to show how nobility and baseness are found in both camps. This will not serve a partisan cause, to be sure; much better than that, it will exalt patriotism, nationalism, human nature itself."

Alas! you are mistaken. Impressionist that he is, and free lance in style and in philosophy, M. France is not set free by the truth which historians once thought they strove after. Instead, he is the victim of an idea. Nothing is more reasonable. For, "to believe nothing is to believe all; and it isn't well to keep the mind too free and too vacant, lest we shut up there by chance stores of an extravagant form and weight, such as have no place in minds reasonably and moderately furnished with beliefs."* The "extravagant" idea, which obsesses M. France, whose mind is not "reasonably and moderately furnished with beliefs," is ignoble and disturbing.

Thru the pages of his new book defiles a considerable procession of characters, painted, in many of the externals, to the life. One recognizes in the author an artist whose thoughts are, in one French critic's words, "as swift as is Parisian life"; as full of variegated colors as the River Seine on a sunny day; one whose wit shines like the boulevards under the street lamps. One feels, moreover, that here is one who has not only his fluctuating impressions to guide him in writing an historical novel, but extensive scholarship, an intimate knowledge of the books, pamphlets, paintings and prints of the novel's period. The representatives of Parisian society chosen out of the mass of their fellows to serve their author's purposes discuss "Werther" most plausibly, sentimentalize à la Jean-Jacques, and admire the

*"La Rôtisserie de la Reine Pédauque," p. 166. This novel has recently been translated into English and published by Mr. John Lane.

pictures of Boilly and Carle Vernet. The representation is so masterly in detail that your first suspicion is: "This is too perfectly arranged!"

Your second complaint is more grave, striking to the root of the matter. In spite of the fine traits of character drawn in this personage and that—civic virtue in the portrait of Evariste Gamel (painter of David's school and patriot of Robespierre's); kindliness and charity and courage in the portrait of Brotteaux, devoted reader of Lucretius; innocence and Christianity in the portrait of Father Longuemare; a piquant boldness no less than a warm sense of gratitude in the girl Athenaïs—M. France is at vast pains to give two irredeemable characters for every figure that is half-way redeemed, and to blacken even those souls which showed some signs of becoming heroic in spite of their creator. Father Longuemare is retouched that he may appear less a Christian martyr than an old fool; Brotteaux, having performed noble actions which almost persuade us that he is, after all, a true Epicurean, and not an eighteenth century one, is hastily reduced to the moral value of a *vieux marcheur;* we are too brutally reminded what is the *état* of the girl Athenaïs, a coarse-mouthed harlot; Evariste Gamel is redrawn—for evolution is a process beyond M. France—as monster and madman. Finally, it goes without saying that the women of the story are sisters of the Jahel and Catherine of the "Rôtisserie."

When all is said, where are we? In view of the author's theory that men are incorrigible, where *could* we have arrived? M. France smiles at us from the last page as from the first; but if we did not at first recognize it for a mocking smile, we read it now aright. He has written for our delectation—or for his —some very clever pages. He has for the first time succeeded in suggesting something of the movement of masses of men and women—not in the bold manner of Balzac, to be sure, but with some subtlety. He has painted rather striking genre pictures, albeit studied and obviously posed. He has shown us how the passing of the tumbril means to the young engraver Desmahis nothing more than a bothersome interruption in his pursuit of a pretty milliner thru Paris streets. Some of his readers he leaves, doubtless, with the impression that the greater the crisis the greater man's vices and ineptitude. But is that a lesson worth learning? Is Anatole France, with all his culture, with all his science (sacred and profane), wise in seeming to teach that his fellows are best employed in gratifying base appetites, since they will, so occupied, have less time left to work dangerous mischief? And of what right does this critic of the revolutionists attack or belittle Revolution if he can find nothing better to offer to our admiration in its stead? "The Olympian detachment of M. France is illusory," Mr. Stuart P. Sherman has written; and the words are well found. "Without a place to stand on, a man can no more despise his fellows than Archimedes could lift the world."

Anatole France is, in the truest possible sense, the complete nihilist. In writing historical romance he commands a hearing both as romancer and as historian. Only momentarily, however; for he mortally affronts both history and romance in striking down truth and in undermining self-respect. He is not only the complete nihilist; he is also, of all living authors, the most delicious and the most sterile. His delicacy of style is perhaps not best shown in "Les Dieux ont Soif," but his sterility of thought is beyond cavil.

New York City.

Reviews of New Fiction

Dostoevsky's Last Work

Of the great Russian trilogy of nineteenth century novelists, Turgenev, Tolstoy and Dostoevsky, the last is least known to us Westerns. His "Crime and Punishment" has found some readers and has been presented more or less disguised on the American stage, but not until now, thirty-two years after his death, have we had a complete English translation of *The Brothers Karamazov.** It is not every novel that would be thought worth translating into a foreign tongue that length of time after publication. It is a satisfaction to have it and interesting to see it, even tho there be few who will read it thru. It is confused, heterogeneous and interminable; quite literally the last because it was left unfinished by the author's death at the age of sixty. But no one will miss the ending because it has no plot or structure and might have been continued indefinitely. As it is, there are 838 pages of it and they contain everything imaginable; politics, theology, amorous intrigue, drunkenness, murder, trial, imprisonment; things great and small coming one after the other without any order or perspective, just as they do in real life. That indeed is the secret of the power of the Russian novelists, their ability to present life in big raw chunks. They are more chroniclers than historians, too conscientious or too literal minded to leave anything out. Whatever happens to any of their characters that must be put down at full length simply because it happened, however dull or insignificant it may seem.

But if there are few who will find the whole volume interesting there are few who will not find something to interest them in it. As for the present reviewer, he turns to a passage which attracted his attention some years ago and to which he has before alluded in The Independent. (No. gentle reader, the reviewer does not profess a knowledge of Russian. He is obliged to confess that he had to use a German pony.) The passage is in the chapter headed "Ivan's Nightmare," possibly embodying a personal experience, for Dostoevsky, like many another genius, was an epileptic and at times more than half crazy. Ivan, being afflicted with a fever, is visited by a middle-aged Russian gentleman of somewhat shabby appearance, who professes to be the devil, in spite of Ivan's efforts to prove that he is merely an hallucination, projected by his subconsciousness. At any rate, his conversation is lively and original, especially the ingenuous way in which he presents the old theological argument that the existence of a spirit of evil is necessary in order that goodness may exist; that there must be a hell or heaven could never be. Here is a bit of the devil's *apologia pro vita sua:*

"Mephistopheles declared to Faust that he desired evil, but did only good. Well, he can say what he likes, it's quite the opposite with me. I am perhaps the one man in all creation who loves the truth and genuinely desires good. I was there when the Word, Who died on the Cross, rose up into Heaven bearing on His bosom the soul of the penitent thief. I heard the glad shrieks of the cherubim singing and shouting hosannah and the thunderous rapture of the seraphim which shook heaven and all creation, and I swear to you by all that's sacred I longed to join the choir and shout hosannah with them all. The word had almost escaped me, had almost broken from my lips . . . you know how susceptible and esthetically impressionable I am. But common sense—oh, a most unhappy trait in my character—kept me in due bounds and I let the moment pass! For what would have happened, I reflected, what would have happened after my hosannah? Everything

*The Brothers Karamazov. A novel in four parts and an epilog by *Fyodor Dostoevsky*. From the Russian by Constance Garnett. New York: The Macmillan Company. $1.50.

on earth would have been extinguished at once and no events could have occurred. And so, solely from a sense of duty and my social position, I was forced to suppress the good moment and to stick to my nasty task. Somebody takes all the credit of what's good for himself, and nothing but nastiness is left for me. But I don't envy the honor of a life of idle imposture, I am not ambitious. Why am I, of all creatures in the world, doomed to be cursed by all decent people and even to be kicked, for if I put on mortal form I am bound to take such consequences sometimes. I know, of course, there's a secret in it, but they won't tell me the secret for anything, for then perhaps, seeing the meaning of it, I might bawl hosannah, and the indispensable minus would disappear at once, and good sense would reign supreme thruout the whole world. And that, of course, would mean the end of everything, even of magazines and newspapers, for who would take them in? I know that at the end of all things I shall be reconciled. I, too, shall walk my quadrillion and learn the secret. But till that happens I am sulking and fulfill my destiny tho it's against the grain—that is, to ruin thousands for the sake of saving one. How many souls have had to be ruined and how many honorable reputations destroyed for the sake of that one righteous man, Job, over whom they made such a fool of me in old days. Yes, till the secret is revealed, there are two sorts of truths for me—one, their truth, yonder, which I know nothing about so far, and the other my own. And there's no knowing which will turn out the better."

We would not presume at this late day to review a book that has been so much discussed by more competent critics. Better than anything we could say will be to quote what Prince Kropotkin said of it in his lectures on Russian literature, delivered before the Lowell Institute in 1901. His opinion is both authoritative and appreciative, for Kropotkin, like Dostoevsky, was the champion of the poor and oppressed, and like him, too, was banished to Siberia for that reason:

"*The Brothers Karamazov* is the most artistically worked out of Dostoevsky's novels, but it is also the novel in which all the inner defects of the author's mind and imagination have found their fullest expression. The philosophy of this novel—incredulous Western Europe; wildly passionate, drunken, unreformed Russia; and Russia reformed by creed and monks—the three represented by the three brothers Karamazov—only faintly appears in the background. But there is certainly not in any literature such a collection of the most repulsive types of mankind—lunatics, half-lunatics, criminals in germ and in reality, in all possible gradations—as one finds in this novel. A Russian specialist in brain and nervous diseases finds representatives of all sorts of such diseases in Dostoevsky's novels, and especially in *The Brothers Karamazov*—the whole being set in a frame which represents the strangest mixture of realism and romanticism run wild."

History and the Romantic Elixir

To most of us History is the Doctor Faustus of writing, a vague and senile memory fast tottering thru the gates of oblivion. But behold, our novelist comes along with Mephistophelian power and injects into that ancient body the warm, glowing elixir of high romance. The old fellow, tricked out in gallant fashion, drags us after him into pulsing scenes of battle, fierce fray and tender love, tavern brawls, rescues of ill-treated dames, till we are like to cry, Enough! and wonder if the good old times were so highly desirable after all.

We have traveled many a highway of romance since the days of Ainsworth and James, but it must be confessed our fellow travelers still use the same high-spirited air, ready tongue and easy flashing sword as in our school days. The schoolboy who knew his Henty scraped thru many an examination in history. It was history in pleasant doses—the pill in the jam. And some of us still take our history cunningly mingled with the romance of the historical novel.

In *The Burgundian*[1] Marion Polk Angellotti writes entertainingly if not too convincingly of the court of the mad king, Charles VI of France, and its internecine quarrels. From the moment that the Duke of Burgundy rides into the castle of Barbazan, the boyish Rosamonde, daughter of that house, tastes many cups, bitter and sweet. How she came to court, was wooed by Louis of Orleans, how murder stayed her ambitious climbing, and how she found happiness at length, is vividly chronicled.

The period of the Reformation and the pontificate of that gay ecclesiastic, Leo de Medici, has rarely been painted for us in such glowing colors as by William Stearns Davis. The character of Martin Luther, who gives the title to this scholarly work, *The Friar of Wittenberg*[2]—a not too alluring title, by the way—is admirably and sympathetically

[1] The Burgundian. *By Marion Polk Angellotti.* New York: The Century Co. $1.30.

[2] The Friar of Wittenberg. *By William Stearns Davis.* New York: The Macmillan Company. $1.35

treated. The adventures of the narrator—gayest of the gallants of Rome, but won over to be the reformer's warmest adherent—his conflicting love for Italy and Germany, and his love affairs (in which a tender German maiden wins him from a passionate Italian) are thrilling enough, in all truth, and the author is to be congratulated on his flesh and blood characters.

There were stirring times in the Low Countries during the Spanish occupation. They were unhappy times, too, when fire, sword and all the terrors of the Inquisition followed in the wake of the Duke of Alva, who figures in *The Shadow of Power,*[3] tho in a publisher's notice as King of Alva. Mr. Paul Bertram enlists our sympathies on behalf of a Spanish governor who in the end takes service with the Dutch Prince of Orange. The story is told as a diary, and we have tortures, fighting and love making galore. It is a readable story, in spite of the beclouded ending.

Ireland's wrongs after the coming of William of Orange to the English throne form the lurid background of *Beyond the Law,*[4] which was awarded the prize in a first novel competition held by an English publisher. The judges, W. J. Locke, A. C. Benson and A. E. W. Mason, described it as a "lively, unaffected and interesting story of good craftsmanship, showing imagination and insight with both vivid and dramatic qualities." Miss Alexander's tale is all that, but the pictures of war, rape, rapine, murder, false friendship and general woe and desolation are not for squeamish readers. The *motif* of Dermot Lisronan, an Irish Ravenswood, is conveyed in his own words: "Revenge! Today for revenge and tomorrow for mourning." The characters are exceedingly well drawn and there is no stint of action. A mildly interesting novel of the Jacobite cause, dealing with a small circle of Scottish exiles in Amsterdam, is Mr. Allan McAulay's *Beggars and Sorners.*[5] The heroine, a young lady of spirit, comes to the house of a Scottish-Dutch banker as guest, and is entangled in the web of intrigue spun about Prince Charlie, the Young Pretender. Interwoven is the tragic romance of a young Highlander, brother to a traitor, and the daughter of a laird, both exiles. The sorners—or those who lived upon the hospitality of their friends—are a somewhat pathetic crew, but we miss the sure touch of a Stevenson or a Neil Munro in the Scots character.

New York during the early period of the republic is the scene of a slight but charming story by Mrs. Jeanie Gould Lincoln. *The Luck of Rathcoole*[6] is a locket with which is bound up the fortunes of Mistress Faith Wolcott, her lover Nugent Carmichael, and the fascinating Irish actress, Patrice O'Halloran. Mrs. Lincoln is more at home with her broken French dialect than Scots, and we would gently inform her that "speir" does not mean "think," but "ask" or "inquire."

Universal peace has rarely had such an earnest advocate as Donal Hamilton Haines. Reading his story of the Franco-Prussian war—*The Return of Pierre*[7]—one feels the horror of war, its uselessness, and the helplessness of the pawns played upon the battlefield by the opposing emperors. A simple narrative of the service of Pierre Lafitte in the French army, his love for the daughter of a fine old colonel, and the mischief of a German spy, it rings true in every line. Not even Zola has given us such convincing pictures of the field hospital, the agonies of the march, the advance and retreat; and the seamy side of war is laid bare with unflinching art. Maurice Leblanc, forsaking Arsène Lupin, has written a powerful study of the conflict roused in the mind of a peace propagandist by the invasion of his country. *The Frontier*[8] named is that between France and Germany, and the *casus belli* the seizure of a French commissary on French soil by Germans. A professor of history, holding the cause of peace before that of patriotism, is confronted with two terrible alternatives: the destruction of the good name of the

woman with whom he has had an intrigue or the reaffirmation of false evidence which may plunge his country into war. The story of his love, his weakness and of the choice he makes is told with vivid reality and fidelity to detail.

Disraeli once said that there are always adventures awaiting the adventurous. This truth was never more apparent than in the case of Dynamite Johnny O'Brien—*A Captain Unafraid,*[9] whose career as a filibuster is chronicled by Horace Smith. Born in New York in 1837, known as the Hell Gate Pilot ("Daredevil Johnny," in 1871), Captain O'Brien became a full-fledged gunrunner during the Colombian revolution of 1885. Thereafter he commanded expeditions to Honduras, Hayti, etc., and from 1896 he was chief carrier of munitions of war to the Cuban revolutionaries. This veracious record of hairbreadth escape on the high sea and in the judicial courts of the United States makes good reading, and all the more so since it is true.

GILBERT K. CHESTERTON

Manalive

"All habits are bad habits" is the text of G. K. Chesterton's latest story,* which will be as delightful to his admirers and distasteful to his antipathists as any of his former productions. In his essays Mr. Chesterton's method is first to set down something that sounds like a wild absurdity and then to argue the reader into the admission—cheerful or indignant, according to his temperament—that it is a very sensible thing after all. In his romances his method is essentially the same. Nobody could act crazier than Mr. Innocent Smith in the first chapters of this volume, but in the end he is proved, by a long legal process, to be the only really sane man of the lot. He is accused of about as many crimes as the hero of Jokai's tale, "The Death's Head," confest to, but he turns out to be quite as guiltless. Charges of murder, burglary, bigamy and kidnaping, amply certificated, slip off him like water off a duck's back. Neither prison nor asylum can hold Manalive. Smith's theory is that if you keep the commandments you may violate the conventions; which, being the reverse of the ordinary rule of procedure, gets him into all sorts of misunderstandings. He had evidently read Schopenhauer's theory that the only happiness is the pursuit of happiness, and, what is more, he acts upon it by letting go what he most delights in that he may recapture it. He goes round the world in search of his own home, and his series of amorous adventures are conducted in strict accord with monogamous morality. By getting outside of himself he can gain the joy of coveting his own possessions. The economic law of diminishing returns applies to all our habitual pleasures, and to escape it we must be continually seeking new investments.

So Manalive is distinguished from ordinary men in that he has legs that he uses. He is not rooted. He breaks out and runs around and discovers the most novel and wonderful things in the most commonplace environment. His motto is "All is gold that glitters, for the glitter is the gold."

Mr. Chesterton is as fond of a chase

[9] A Captain Unafraid. *By Horace Smith.* New York: Harper & Brothers. $1.25.

* Manalive. *By Gilbert K. Chesterton.* New York: John Lane Company. $1.30.

as a fox hunter or a kinetoscope man. We have it here as we had it in "The Man Who Was Thursday" and "The Ball and the Cross." As usual he stops every little while and paints a cloudscape to rest our eyes; and all along he enlivens the way by epigrams and inverted proverbs. Here are a few:

"When men are weary they fall into anarchy; but when they are gay and vigorous they invariably make rules. We are never free until some institution frees us; and liberty cannot exist until it is declared by authority."

"For she was one of those women who at bottom regard all men as equally mad, wild animals of some utterly separate species."

"Tho she never spoke she always looked as if she might speak any minute. Perhaps this is the very definition of a companion."

"All that the parsons say is unproved. All that the doctors say is disproved. That's the only difference between science and religion there's ever been or ever will be."

"The academic mind reflects infinity, and is full of light by the simple process of being shallow and standing still."

"With our weak spirits we should grow old in eternity, if we were not kept young by death. Providence has to cut immortality into lengths for us, as nurses cut the bread and butter into fingers."

"In every well appointed gentleman's house, I reflected, there was the front door for the gentleman and the side door for the tradesmen; but there was also the top door for the gods. The chimney is, so to speak, the underground passage between earth and heaven. Santa Claus's door was really the front door: it was the door fronting the universe."

It is, as a general rule, a mean trick in a reviewer to sit in his corner like little Jack Horner and put in his thumbs and pull out the plums of a new book. But in this case there is no injustice done the author or the publisher, for there are plenty more where these come from. And if any one thinks what is said above gives away the secret of the plot he will find out differently when he comes to read the book. EDWIN E. SLOSSON.

September Thrills

A BOOK for a sleepy afternoon in hammock-land or for the evening when the limbs are tired with exercise; a book where something is doing every minute: that is what the summer reader demands. And September is still summer!

First of all to meet that requirement is the incomparable H. Rider Haggard. Not only that, but in *Marie*[1] we meet again a dear friend—the Allan Quatermain of "King Solomon's Mines" and other African tales. With all of his old fire the writer gives Allan's account of his youth and his love for his first wife, Marie Marais, a Boer maid; and a tragic tale it is. We read of the Boer trek to Delagoa Bay in 1836, how Allan followed Marie and saved her life from the Zulu despot Dingaan, how he accompanied Retief in his historic expedition to Dingaan, of the massacre, of his trial on false charges, of an unscrupulous rival and a great sacrifice, and more. It is to be an eager-eyed, breathless boy or girl again to turn the pages.

There are so many touches that are admirable in *The Isle of Strife*,[2] notably the characterization of that pleasant rogue Esper, that one can hardly find it in his heart to be angry with the author for his general careless and slovenly writing. Mr. George C. Shedd has a thorny path to travel before he can substantiate the claim of his publisher to the vague title of "the new American storyteller." A mysterious plan of a fortification involves a young American in a lot of trouble, and the quiet little island off the coast of Maine in which the scene is laid sees strange happenings and bloodshed before all is straightened out and the attendant love story comes to a happy end. We cannot see anything to commend in the "bled" illustrations.

One can always anticipate a thrill from Mr. H. B. Marriott Watson. His easy, clear and vivacious style carries his characters over places where less experienced writers might bring them to confusion. When a young man, buying a Japanese box in an auction room where he is sheltering from the rain, is at once dogged by people anxious to buy or steal that box, then there is something doing. It is treasure, and its quest carries the hero and his friend into the wilds of South America, where they meet the two most lovable women and the most horrid gang of villains in the world. Adventure follows fast and furious. A rattling good story of its kind is *The Big Fish*.[3]

There is much that is clever in *The Lure*,[4] but its interest is uneven. Mr.

[1] MARIE. *By H. Rider Haggard.* New York: Longmans, Green & Co. $1.35.

[2] THE ISLE OF STRIFE. *By George C. Shedd.* Boston: Small, Maynard & Co. $1.25.

Huntly Goss, middle-aged Don Juan, editor of a gorgeous organ of snobbery and promoter of crocodile farms on the Nile, does not convince the reader of his magnetic attractions, tho in the book Anne Moorhouse nearly yields to them. Mrs. Goss, her idiot son, and the Greek brothers Papadopoulo are the characters which linger in our memory. Miss E. S. Stevens has written a book that will appeal to women, and the pictures of London society and the Nile have their interest.

As smartly written and entertaining a book as has been issued for some time is Mr. Laurence North's story of London journalism, *The Golightlys, Father and Son.*[5] Mr. Potiphar Golightly is a likable and pathetic figure, from his buoyant appearance in the publishing world as purveyor of healthy tales for errand boys and servant girls to the ownership of *The Beacon* and other catchpenny organs of public opinion. Cleverly conceived figures are those of his wife, his aid Dorian Stepney, his son Osric, his unacknowledged son Punchie Hay, who brings down the house of Golightly, and Kitty Adderley, a young lady of adventurous tastes. Mr. Laurence North is an author to be reckoned with in future.

"Mr. Fenton is one of the best men that ever lived," says Alice Delemere, in *The Hero and the Man.*[6] But she was a journalist, the author of a best seller, and she loved John Fenton. The paragon of this novel of municipal politics in a typical growing Western town must have been created by a woman—tho L. Curry Morton gives us no clue as to sex. Certainly Fenton is unhumanly good and generous, a figure apart in his self torturing and his general part of good Samaritan. But perhaps this story, with all its studied word painting, will fill some one's requirement of September thrills.

Real Fairy Folk. By Louise Jamison. Garden City: Doubleday, Page & Co. $1. $1.

No primitive folklorist or his modern

I AM A FROG, MY FAMILY NAME IS RANA.
From "The Real Fairy Folk" (Doubleday, Page)

imitator ever could imagine such grotesque monsters, such marvelous metamorphoses and such curious adventures as exist all about us in the insect world. To open the eyes of children to these everyday wonders is the object of this book. The author has not the literary skill of a Fabre in making real and human the life of insects, but she makes the bugs and beetles and butterflies tell their stories in an interesting fashion, and the youthful reader or hearer will have acquired painlessly a considerable knowledge of entomology, mingled with fairy-lore alloy.

A Woman of Genius. By Mary Austin. Garden City: Doubleday, Page & Co $1.35.

Mrs. Austin has attempted in this novel an interpretation of an unusual character and her antithesis, "the ordinary woman." Unintentionally, her portrait of Olivia Lattimore, the woman of genius, repels. There seems to be a curiously perverse cult in some of the late novels—that of immorality without excuse in the situations, altho not without justification by the author. Because Olivia's old lover insists upon her leaving the stage and going to Mexico when they marry, she refuses to be married to him at all, but enters into illicit relations with him. Both were widowed, there was no barrier between them except that of stubborn wills. Pauline Mills, who stands as the type of the sheltered,

[3] THE BIG FISH. *By H. B. Marriott Watson.* Boston: Little, Brown & Co. $1.25.
[4] THE LURE. *By E. S. Stevens.* New York: John Lane Company. $1.30.
[5] THE GOLIGHTLYS, FATHER AND SON. *By Laurence North.* New York: George H. Doran Company. $1.25.
[6] THE HERO AND THE MAN. *By L. Curry Morton.* Chicago: A. C. McClurg & Co. $1.35.

FROM F. HOPKINSON SMITH'S "THE ARMCHAIR AT THE INN" (SCRIBNER)

"adorably feminine" woman, does not get fair treatment at Mrs. Austin's hands. She was selfish and blind to her friend's need in Chicago, where Olivia nearly starved, and we are expected to dislike her, but when she cuts Olivia's acquaintance we do not blame her, but share her disgust—or perhaps we should use the gentler word, distrust. Olivia's offense seems to us gratuitously evil. We have grown accustomed in fiction to the more or less whole-hearted condoning of immoral relations when marriage is rendered impossible by some insuperable barrier, but the view given in *A Woman of Genius* is indefensible on any ground. The robust morality of "Jane Eyre" needs to sweep thru these mephitic novels like a blast from a Yorkshire moor. The earlier chapters, dealing with the life in a little Ohio town before Olivia takes to the stage, are charmingly conceived and written, and the picture of girlhood in the "early '80s" is drawn with clever strokes:

> "The real business of a young lady in Taylorville was getting married, but to avoid an obviousness in the interim, she played the piano or painted on satin or became interested in missions."

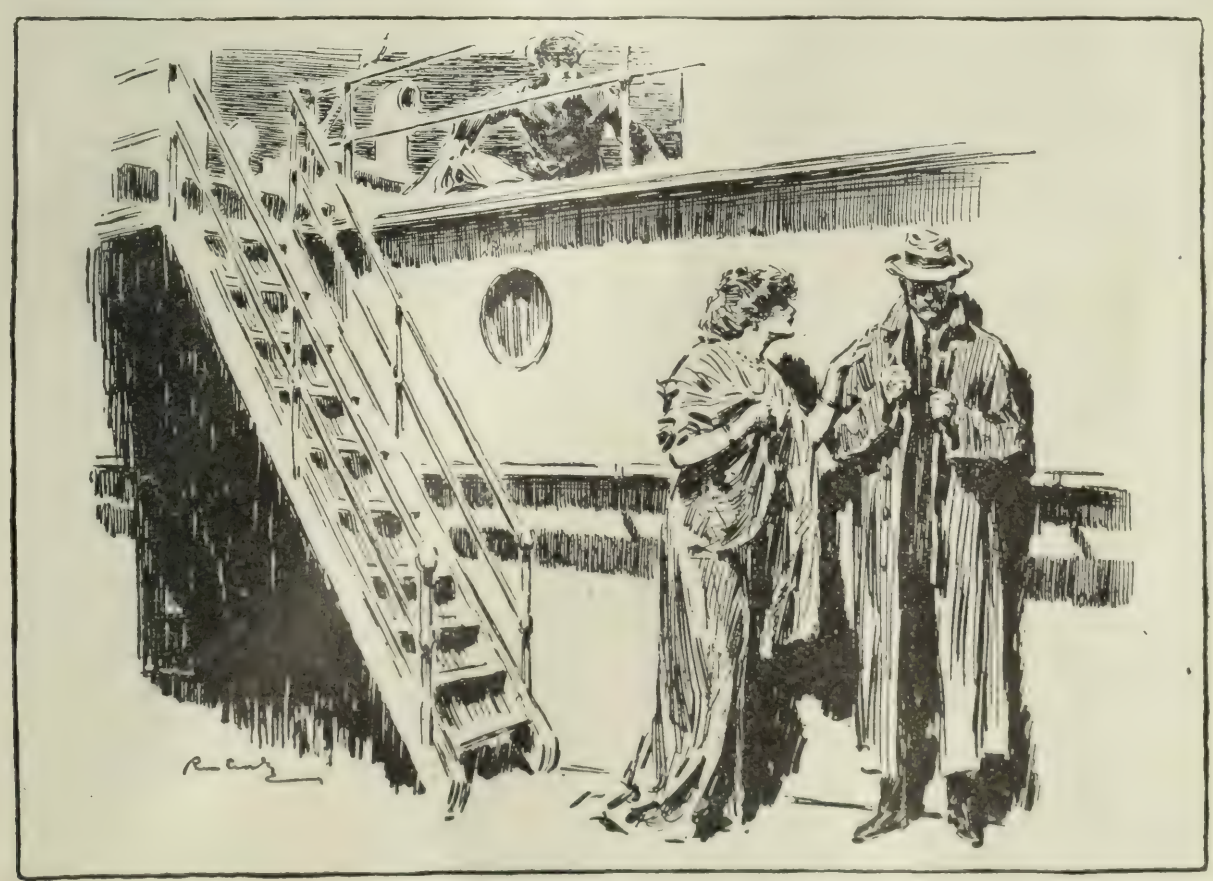
In spite of an apparent effort to be fair to other women, there is a note of scorn thruout which grates on the nerves. The woman of genius goes her way into the mire and slime not because she has genius, but because she is passionate and lawless. The rank and file of women keep to the beaten path not because they are stupid, but because they are wise.

The Arm-Chair at the Inn. By F. Hopkinson Smith. New York: Charles Scribner's Sons. $1.30.

Mr. Hopkinson Smith writes as he paints—with meticulous attention to the picturesque detail. There is always an open wood fire in his books, with its glow on a circle of genial faces, and the friends who sit before the hearth are worthy of its radiance. *The Armchair at the Inn* is the latest of these fireside chronicles telling engagingly of a group of artists celebrating the honor that has come to one of them in the gold medal. The armchair is found at the most perfect of inns, tucked away into a corner of Normandy. The host is more than in name a man who delights in serving his guests; the furniture is old and rare; the wines are priceless; the chef is a genius; the serving-maid is named Mignon. The guests are six—just a comfortable number to sit around a dinner table or in front of a fireplace. Of course they tell

stories, many of them of savage Africa, and we are glad to eavesdrop a little, in order not to lose the good things said, for the guests are excellent raconteurs as well as the best of good fellows and comrades. The slender thread of a love story running thru the chapters ends happily, as is fitting in so genial a world.

"C Q," or In the Wireless House. By Arthur Train. New York: The Century Company. $1.20.



The novelists of today seize upon new inventions with the same avidity as they used to search for new dialects. Romances in automobiles had a great run for awhile, until aeroplanes outstript them. But with the marconigram the speed limit has been reached if the physicists are right in saying that nothing can ever go faster than 186,000 miles a second. Mr. Train's style moves with a corresponding swiftness and we make acquaintances with the passengers of the "Pavonia" more quickly than we have ever found it possible when we have crossed on her sister ships. But then we never, at least to our knowledge, had as fellow passengers an innocent murderer, a self-sacrificing embezzler, a world-famous beauty smuggling an incomparable pearl necklace, and a freckled earl in disguise, so, naturally, we never had such an exciting time as did the "Pavonia" on this voyage.

Downward. By Maud Churton Braby. New York: William Rickey & Co. $1.25.

A novel sufficiently described by its title, *Downward*, is the story of the unequal penalty imposed by society upon the man and the woman who are equally guilty. Poor, pretty, weak, pleasure-loving Polly finds that "the sin ye do by two and two, ye pay for one by one," and that she has to do the paying. The life of nurses in a London hospital is excellently drawn and there are some scenes powerfully portrayed, but as a whole the effect is unpleasant, and Polly's character is too light to win ungrudging sympathy.

The Minister of Police. By Henry Mountjoy. Indianapolis: Bobbs-Merrill Co. $1.25.

Nowadays court intrigues and police scandals make popular reading; perhaps it was always so. *The Minister of Police* of Henry Mountjoy served the fifteenth Louis of France, when life in Paris and

A CONVERSATION OVERHEARD
From Train's "C Q" (Century)

at Versailles was little or no better than it is in New York today. Mr. Mountjoy's tale is well strewn with great names: Richelieu, du Barry, Voltaire, Rousseau. This last is, indeed, a very *deus ex machina*. The romance is the familiar admixture of known figures (rather stilted in posturing) engaged in imagined adventures with adventurers imagined. The events and dialog are pitched high—court folk are stagey in their "falsity, and trickery, and coldness, and absolute want of heart"; the people of Paris are damned with "brutal misery"—but is there not room for melodrama between both covers as well as on the stage? The author certainly knows more of the period than do most of his rivals in historical fiction.

Fiction Notes

....*The Legend of Love,* by Howard V. Sutherland, tells the story of the love of Yverdêl for Eidole, the soulless daughter of King Ba, in a style which agreeably reproduces the atmosphere of medieval romance, tinged with a skeptical modern humor. (New York: Desmond Fitzgerald.)

....A lively story by Douglas Goldring, *The Permanent Uncle* (Dutton; $1.25), introduces a daringly unconventional heroine and two comrades who go wandering in France into adventures, romantic, amusing and of a Pagan simplicity. The author has more humor than good taste in his portrayal of a jealous wife and the harmless escapades of her errant husband.

....Kate B. Sanborn has written an animated "story" of her searches through New York City, and occasionally outside of it, for Indians of the wooden variety that used to be posted in front of cigar shops. Her account, *Hunting Indians in a Taxi,* is elaborately illustrated with photographs of her "finds." It occurs to us that Miss Sanborn has missed an opportunity. Properly equipped with tabulated comparisons, and footnotes, and a bibliography, her work might have been presented to a German university as a thesis on the archeology of New York City and vicinity. (Boston: Badger.)

....The beast stories of the native African tribes have long been a source of interest to students of folk lore. There is room for a volume which brings to English readers a worthy selection of these tales from the Bantu tribes among which they exist. Such a book is Robert H. Nassau's *Where Animals Talk: West African Folk Lore Tales* (Boston: Badger; $1.50). Here is the way the idea of evolution presents itself to the Bantu mind, in a story of the shrew mouse and the lemur:

> Shrew and Lemur were neighbors in the town of Beasts. Lemur said to Shrew, "Go! and take for us fire from the town of Mankind." Shrew consented, for said, "If I go, do not look, while I am gone, toward any other place except the path on which I go. Do not even wink. Watch for me."
>
> So Shrew went, and come to a Town of Men; and found that the men had all emigrated from that town. Yet he went on, and on, seeking for fire; and for a long time found none. But as he continued moving forward from house to house, he at last found a very little fire on a hearth. He began blowing; and kept on blowing, and blowing; for the fire did not soon ignite into a flame. He continued so long at this that his mouth extended forward permanently with the blowing.
>
> Then he went back, and found Lemur faithfully watching with his eyes standing very wide open. Shrew asked him, "What has made your eyes so big?" In return, Lemur asked him, "What has so lengthened your mouth to a snout?"

New Books of the New Season

Novelists have learned the lesson that romance and often exoticism itself—is not far to seek. Thus New York City is, in part, the scene of James Oppenheim's novel, *The Olympian* (Harper); and the same city-monster dominates *Her Soul and Her Body,* an essay in fiction by the clever actress, Louise Closser Hale (Moffat). Not every one looks to Brooklyn for romance: but that is what Lucille Baldwin Van Slyke is said to have done in *Eve's Other Children* (Stokes). Another Brooklyn story is the late Margaret Sangster's *Eastover Parish* (Revell). A different Oppenheim than the one named a few lines above—this time it is the Oppenheim who is the subject of a signed article in this issue—writes *The Tempting of Tavernake* (Little). A well-known contributor to THE INDEPENDENT, Rev. Charles M. Sheldon, tells the story of an American's ambition in *A Builder of Ships* (Doran). Romance is hinted at in Arthur Sherburne's title, *Amélie* (Harper). Paris affords the type, *Le Gentleman,* for Emily Sedgwick (Small). The Klondike sends us more shivers in Jack London's *Smoke Bellew* (Century). Samuel Hopkins Adams publishes *The Secret of Lonesome Cove* thru Bobbs-Merrill, who issue also A. P. Terhune's novel, *The Woman.* A Western novel is Caroline Lockhart's *The Lady Doc* (Lippincott). Holt announces a story by the *Sun's* music critic, W. J. Henderson, in *The Soul of a Tenor.* E. Temple Thurston's *Antagonists* (Appleton) and W. T. Locke's *Joyous Adventures of Aristide Pujol* (Lane) have already delighted serial-readers. *One Woman's Life* is the title of Robert Herrick's new novel (Macmillan). Ralph Henry Barbour's *Cupid en Route* is a holiday book announced by Badger. The title of the new novel by Henry S. Harrison—the "Queed" man—has not yet been announced by the Houghton Mifflin Co. The late Myrtle Reed is represented by *The White Shield* (Putnam). Dr. Van Dyke's *Unknown Quantity* contains some of the modern fables published serially as "Half Told Tales," and more French-Canadian stories (Scribner). Maud

Howard Peterson, author of "Potter and the Clay," adds to it on the book-shelf *The Sanctuary* (Lothrop). Canon Sheehan's *Miriam Lucas* will be published by Longmans, Green. Juveniles are not included in this list, but a girl's story by Alice Brown is a law unto itself: *The Secret of the Clan* (Macmillan). So is John Masefield's *Jim Davis* (Stokes). The Connecticut humorist, Irving Bacheller, writes *Change It* (Harper). Mrs. Alice Hegan Rice undertakes a longer story than ever before in *A Romance of Billy Goat Hill* (Century). There is a long list this autumn—so long we cannot quote a quarter of it—of

Historical Novels

Marjorie Bowen is there with *The Quest of Glory* (Dutton). Mary Johnston utters *Cease Firing* (Houghton). Others on the list are Eden Phillpotts with *The Lovers* (Rand); Richard Dehan with *Between Two Thieves* (Stokes); and then there is *The Lure of Life,* by the Castles (Doubleday); *The Strong Hand,* by Warwick Deeping (Cassell); *Mrs. Lancelot,* by Maurice Hewlett (Century); *The Son of Columbus,* by Molly Elliot Seawell (Harper); *A Health unto His Majesty,* by Justin Huntly McCarthy (Doran), and *The Green Devil,* by Arthur Metcalf (Pilgrim Press).

Translated Fiction

It is too soon to tell about the autumn crop, but it is a fact that translations nowadays are better made than once they were. It was time for an improvement! A new book by the author of "Marie-Claire" is announced by Doran in Mlle. Audoux's *Valserine.* The same publisher will issue an English translation of the Goncourt prize novel by Alphonse de Chateaubriant: *The Keynote.* ("Monsieur de Lourdines"). Foreign fiction to be published in translation includes also Hauptmann's *Atlantis* (Huebsch), Nordling's *Moonlight Sonata* (Sturgis), Pierre de Coulevain's *American Nobility* (Dutton), and Louis Pergaud's *Tales of the Untamed* (another Goncourt prize story (Outing).

Drama

The first volume of Hauptmann's *Dramas,* edited by Ludwig Lewisohn and published by Huebsch, contains four plays. The American Edward Knoblauch and the English Arnold Bennett collaborate in the three act play *Milestones* (Doran). The former's *Kismet* and the latter's *The Honeymoon* are published by the same house; also Githa Sowerby's *Rutherford and Son.* In two volumes, Houghton publishes W. V. Moody's *Poems and Plays. Lucky Pehr* and *Easter,* by Strindberg, are announced by Stewart & Kidd, while Scribner continues to issue Mr. Björkman's translation of the Swedish Drama, volume by volume, and Luce, of Boston, will publish four plays by the same author. *Who's Who in the Theater,* a biographical dictionary by John Parker, will bear the imprint of Small, Maynard & Co.

Poems

Young America expresses itself in Hermann Hagedorn's *Chants and Poems* (Houghton), and the *Lyric Year* anthology (Kennerley) Madison Cawein's *The Poet, the Fool, and the Faeries* is announced by Small, who publish also a volume at the opposite pole: Robert V. Carr's *Cowboy Lyrics. The Mountany Singer* is a volume of lyrics by one of the younger Irishmen: Seosamh MacCathmhaoil (Four Seas Co.). A talented humorist of more literary range than most humorists is Franklin P. Adams, whose *In Other Words* is announced for the autumn (Doubleday). The Yale University Press announces an anthology by deceased American writers in Professor Lounsbury's *Yale Book of American Verse.* The same press will issue Professor Wetmore's *Index Verborum Catullianus,* uniform with his Virgil index, and Kenneth McKenzie's *Concordanza delle Rime di Francesco Petrarca.*

Criticism

Trenchant writing may be looked for in Irving Babbitt's *Master of Modern French Criticism* (Houghton). Kennerley announces *J. M. Synge,* by P. P. Howe; *Post Liminium Essays,* by Lionel Johnson; *Thomas Hardy,* by Lascelles Abercrombie; *Walter Pater,* and *A. C. Swinburne,* by Edward Thomas; *William Morris,* by John Drinkwater. Lacy Collison-Morley signs a work on *Modern Italian Literature* (Little). In the Harvard Studies in Comparative Literature is announced *Chivalry in English Literature,* by W. H. Schofield.

Essays

A volume announced by Dodd, Mead & Co. is said to include a new essay by Maeterlinck: *News of Spring and Other Studies,* and the same publisher announces the Belgian's *On Emerson, and Other Essays.* John Galsworthy's *Inn of Tranquillity* appears on the Scribner list. Houghton Mifflin Co. favor American subjects: *The Provincial American,* by Meredith Nicholson; Bliss Perry's *The American Mind;* Agnes Repplier's *Americans and Others;* John Burroughs's *Time and Change,* and Dr. Crothers's *In the Hands of a Receiver.* The new Hilaire Belloc book is called *This and That and the Other* (Dodd).

Travel

San Francisco: As It Was, As It is, and How to See It, by Helen Throop Purdy, will appear in its 1915 edition, not in the exposition year, but this fall (Paul Elder). *California, Romantic and Beautiful,* is the theme of Forbes Lindsay (Page). *The Philippines,* by Eleanor F. Egan (Dodd), *The Indians of the Terraced Houses,* by C. F. Saunders (Putnam), and *Panama,* by George Henry Payne (Dodd), are other books for Americans. *Modern Argentina* is by W. H. Koebel (Estes) and *The Argentine in the Twentieth Century,* by A. B. Martinez and M. Lewandowski (Small). Charles Johnson Post narrates travels *Across the Andes* (Outing). *The Flowing Road* is Caspar Whitney's fanciful title for a book of adventures in the great rivers of South America (Lippincott). China looms large on the list of Dodd this year: We find there Henri Borel's *The New China* (from the Dutch); J. Macgowan's *Men and Manners of Modern China,* and Esther Singleton's *China, as Seen and Described by Great Writers. The Charm of Venice,* compiled by A.

H. Hyatt, is another anthology (Jacobs). In the "Things Seen" series (Dutton) are listed two volumes: *Things Seen in Russia,* by W. B. Steveni, and *Things Seen in Palestine,* by Mrs. A. M. Speer. Importations are *Around Holland in Vivette,* by E. K. Chatterton, and *Among Indian Rajahs and Ryots,* by Sir Andrew H. L. Fraser (Lippincott). *Belgium: The Land of Art,* by W. E. Griffis (Houghton); *Switzerland in Sun and Snow,* by E. B. D'Auvergne (Little); *Spain Revisited,* by C. G. Hartley (Pott); *A Winter Holiday in Portugal,* by Granville Baker (Pott), and *The "Flower of Gloster,"* by E. Temple Thurston (Dodd), are books of the European scene. F. Hopkinson Smith, in *Charcoals of Old and New New York* (Doubleday) demonstrated that picturesque material lies nearer at hand, and that words are not essential to rendering it. *Reminiscences of the South Seas,* by the late John La Farge (Doubleday), should prove no common travel-book. *Pygmies and Papuans,* by A. F. R. Wollaston, has for subtitle: "The Stone Age of Today" (Sturgis). *The Man Farthest Down* is Booker T. Washington's account of his European travels.

Biography

Albert Bigelow Paine's life of *Mark Twain* is announced for publication this month by the Harpers. May Sinclair, the novelist, writes of *The Three Brontës* (Houghton). Edward Thomas's *Lafcadio Hearn* will be a very little book; Orlo Williams's *Life and Letters of John Rickman,* a stout one (Houghton). My *Friends at Brook Farm,* by John Van Der Zee Sears (Desmond Fitzgerald), and volumes seven and eight of Emerson's *Journals* (Houghton) may be grouped together. A second instalment of Mrs. Hugh Fraser's memoirs is offered by Dodd in *Reminiscences of a Diplomatist's Wife. John Hancock, the Picturesque Patriot,* is the subject of a study by Lorenzo Sears (Little). Romain Rolland is a critic and scholar as well as a novelist; his *Michael Angelo* has now been translated (Dutton). *Lady Hamilton* is E. H. Moorhouse's heroine (Small), *Marie Antoinette* Francis Bickley's (*ib.*), *Nell Gwyn* Cecil Chesterton's (*ib.*). *Illustrious Dames of the Court of the Valois Kings* are described in a volume translated from the French for the Lamb Publishing Co.

History

The concluding volume of Professor McMaster's *History of the People of the United States* is announced for October by Appleton. Edwin Morse's *Causes and Effects in American History,* and F. W. William's *Anson Burlingame and the First Chinese Mission to Foreign Powers* are on the Scribner list. Houghton promises *A History of the Presidency from 1897 to 1909,* by Edward Stanwood. Max Ferrand edits for the Yale Press *A Journey to Ohio in 1810,* from the journal of Margaret Van Horn Dwight. Baron d'Ambes's *Intimate Memoirs of Napoleon III* and the latest book by the veteran academician, Emile Ollivier, who headed Napoleon III's last ministry, *The Franco-Prussian War and Its Hidden Causes,* are published in translation by Little, Brown & Co. Henry D. Sedgwick describes *Italy in the Thirteenth Century,* and R. M. Johnston *The Holy Christian Church* (Houghton). Harvard University publishes *The Year Books of Richard II,* edited by G. F. Deiser, and a *Mémoire de Marie Caroline Reine de Naples,* now published for the first time, and edited as volume XVI in the Harvard Historical Studies by Professor R. M. Johnston. The American edition of G. H. Pervis's *Germany and the German Emperor* will be issued by Holt.

Public Affairs

Direct Elections and Law Making by Popular Vote, by Edwin M. Bacon and Morrill Wyman (Houghton); *The New City Government,* by Henry Bruère (Appleton); *Handbook of Municipal Accounting,* by U. L. Leonhauser (Appleton); *Socialism and Democracy in Europe,* by Samuel P. Orth (Holt); *Constructive Rural Sociology,* by John N. Gilette (Sturgis); Governor Baldwin's *Relation of Education to Citizenship* (Yale); Edward Eggleston's *Ultimate Solution of the American Negro Problem* (Badger); *The International Mind: An Argument for the Judicial Settlement of International Disputes,* by Nicholas Murray Butler (Scribner); *The New Industrial Day,* by William C. Redfield (Century). These are the titles of some few of the books which suggest that historians have not closed their eyes to the present, or their imagination to the future. A collection of Rousseau's political writings, edited by Prof. C. E. Vaughan of Leeds, will be brought out in two volumes by the Cambridge University Press.

Education and Psychology

The Montessori System in Theory and Practice is studied by Dr. T. L. Smith, of Clark University (Harper), while Holt announces *A Montessori Mother,* by Dorothy Canfield Fraser. The publishers of Dr. Montessori's book (Stokes) announce also a translation of her *Anthropologia Pedagogica.* G. Stanley Hall's *The Founders of Modern Psychology* is announced by Appleton; who publishes *The Social Meaning of Education,* by Irving King, and *Principles of Educational Practice,* by Paul Klapper. *Mother and Baby* are studied by Dr. Anne B. Newton (Lothrop).

Religion

Scribner announces *Main Currents of Modern Thought,* by Rudolf Eucken, one of Dr. Slosson's "Twelve Major Prophets." From the same publisher we await J. H. Breasted's *Development of Religion and Thought in Ancient Egypt,* and *History of Christian Thought Since Kant,* by Edward C. Moore. On the list of Geo. H. Doran & Co. appear: *The Preacher,* by J. H. Jowett; *Expository Preaching Plans and Methods,* by F. B. Meyer; *The Ordinary Man and the Extraordinary Thing,* by Harold Begbie; *The Historic Jesus,* by David Smith; *Faith, Freedom, and the Future,* by P. T. Forsyth; *St. Paul,* by Adolf Diessman; *Efficiency in the Sunday School,* by H. F. Cope; *A History of Preaching,* by E. C. Dargan; *The Papyri at Elephantine,* by Edward Meyer, etc. Cassell announces *High Road to Christ,* by Richard Roberts, and the Yale University Press W. E. Hocking's *Meaning of God in Human Experience.*

The Independent

Entered at New York Post Office as Second Class Matter
Publisher, Clarence W. Bowen
130 Fulton Street - - - - New York

A WEEKLY MAGAZINE FOUNDED IN 1848
One Year, $3.00 Single Copies, 10 Cents

Single copies over six months old, 25 cents. Postage to any foreign country in the Universal Postal Union, $1.75 a year extra; to Canada, $1.00 extra. Subscriptions will be received for other periodicals, and clubbing rates will be granted as low as those offered by any responsible agency.

An order for the change of an address should be received two weeks before the change is to take effect. The old as well as the new address should be given.

For the convenience of our subscribers we will send on receipt of the publisher's price any book reviewed or advertised in our columns.

Volumes of The Independent are completed at the end of December and June, and a full index is furnished free on application. Neat binders holding in book form thirteen current issues will be furnished for 45 cents.

If the numbers comprising any semi-annual volume are returned to us prepaid in good condition with $1.50 we will bind the volume in handsome and substantial half buckram and deliver it free anywhere in the United States.

We are always glad to receive articles for examination, but writers desiring the return of their manuscripts, if not accepted, should send a stamped and addressed envelope. Even so, we cannot hold ourselves responsible for their return. Authors should preserve copies of their manuscripts.

Advertising rates will be furnished on application.

The Panama Disgrace

THE President in signing the Panama bill calls it "one of the most beneficial that has been passed by this or any other Congress." That may well be true, for it provides for the opening of an international highway needed for the last four hundred years. But it is certainly true that the bill is one of the most discreditable and dangerous that has been passed by this or any other Congress, for it covers legislation that could never have been passed upon its merits, throws a heavy financial burden upon the American people, involves us in complications with European and American Powers to an unpredictable extent, violates our treaty with England, puts us before the world as resorting to trickery to gain a commercial advantage and destroys confidence in the arbitration movement in which the United States has had a leading part.

Let us briefly enumerate some of the illegitimate features which this bill conceals.

First: It grants to coastwise shipping a perpetual subsidy of an incalculable amount, millions of dollars a year at any rate. Now if this money had been appropriated from a surplus in the United States treasury it would not be so bad, but it is not. It is money that we have borrowed for the purpose of building the Canal and on which we must continue to pay interest indefinitely. That is to say, this new law puts the American people in the position of borrowing money at a cost of some $10,000,000 a year to themselves for the purpose of enabling the owners of coastwise ships to make a profit out of what might otherwise be a losing business. Worse than that! We have already given these men protection at our expense by the law prohibiting foreign vessels from stopping at two American ports. It has often been argued that we should subsidize the American lines that compete with foreign lines, but no one has ventured to put forth so preposterous a claim as that the coastwise ships should have a *subsidy added to their monopoly* as is done by this act. If any gratuitous favors of this kind are to be granted it would be less absurd to reverse it and grant free tolls to American lines coming into competition with foreign lines instead of to those protected from such competition, and this would be no more of a violation of the treaty than the present act.

Second: The Panama bill admits free of duty foreign-built ships and shipbuilding material when used in the foreign trade. Already we hear complaints that this has caused the loss of millions and will mean ruin to American shipbuilders. That may not be true, or if true it may be worth the sacrifice. We are not arguing that point now. But we do say that such a sudden and unpremeditated change in our protective system should not be forced thru on a rider to a worthy bill having quite another object.

Third: A like objection applies to the radical and extraneous legislation of the bill, such as that empowering the Interstate Commerce Commission to determine whether or not the ownership by any railroad of a steamship line is prejudicial to public interest and to compel if necessary the divesting of the steamship holdings. Such a measure, whether wise or unwise, affecting as it does the

ferry-boats of New York and San Francisco harbors, the passenger steamers of Long Island and Puget sounds, and the shipping of the Great Lakes, has no business in a bill stated by its title to be concerned only with "the opening, maintenance, projection and operation of the Panama Canal and the sanitation and government of the Canal Zone."

Fourth: This discrimination in tolls in favor of our own ships is just what we protested against as unfair and put a stop to when it was a question of canals on the territory of Canada and New Granada, as has been previously shown in these columns.

Fifth: Our treaty with Great Britain expressly prohibits such discrimination, as is shown by the fact that when the treaty was under consideration the Senate voted specifically against an amendment permitting such discrimination.

Sixth: President Taft's recommendation to Congress that the question of the interpretation of the treaty be referred for decision not to the Hague Court but to our own Supreme Court, and the announcement of certain Senators that the United States will never consent to submit this question to arbitration, tend to destroy faith in the sincerity of our attachment to the principle of arbitration.

Seventh: It is argued that the Hay-Pauncefote treaty of 1901 which stipulates equal tolls for all vessels is no longer valid because the Canal Zone in 1904 came under our control. Those who hold this cannot have read the treaty, which provides in Article IV:

"that no changed territorial sovereignty or of international relations of the country or countries traversed by the before-mentioned canal shall affect the general principle of neutralization or the obligation of the high contracting parties under the present treaty."

Eighth: If the Hay-Pauncefote treaty is declared invalid *ab initio* or abrogated at any time in the future by mutual consent or otherwise, will it bring back into effect the Clayton-Bulwer treaty of 1850 which it superseded, or will it go back further and restore the *status quo ante?* If the former, will not Great Britain have equal control of the Canal with us, and if the latter, may not Great Britain reassert her territorial claims to Nicaragua and even be entitled to construct a rival canal thru Nicaragua which, according to the estimate of our own engineers, could be constructed for about half what the Panama Canal is costing?

Now, any and all of these difficulties and embarrassments could have been avoided if a Panama bill pure and simple had been passed. Then we could have considered on their own merits the numerous other questions which have been surreptitiously crowded into this omnibus bill. We could then subsidize ships if we liked, but we would know how much we were paying out and what we are paying for. We could sever the connection between railroads and steamship lines if we chose. But we should enact such important legislation deliberately, openly and honorably, not in such a way as to lay ourselves liable to the charge of meanness and bad faith in international relations.

The above is a plain statement of plain facts in plain prose, but in conclusion permit us to quote the stirring lines contributed to the New York *Times* of August 31 by Prof. John Erskine of Columbia:

You hand us back our troth-plight broken,
  Time-servers, playing in our name!
You pawn our honor like your watch,
Yet spread a cautious ear to catch
  Our verdict on the game!
Masters, this verdict is not spoken—
  'Tis better felt as shame.

"Treaties that gather dust with age
  We now," ye say, "put by."
Must our word yellow with the page?
  Must our sworn promise die?
See now, they also are but dust,
  The servants of our nobler day
Who pledged us to this generous trust.
  And must they, too, be cast away?

Ye shall not masquerade the sin,
  No veil of lawyer's justice spread!
Ere ye dare call the nations in
  To teach good faith with our own dead.
Strike the eagle from our crest!
What flight is ours?
Quick, a true emblem for our land!
Not too brave nor stern, were best—
Nothing that soars or towers.
No more patriot boast or brag!
Count the profit in the hand,
Play the purse against the fates!
And the stars that led the States
When honor chose our wars
Take the stars from the flag!
Why insult the stars?

The Sunday Postal Law

One of the acts of the late Congress was the provision, in behalf of post office clerks, that "hereafter post offices in cities of the first and second classes shall not be open on Sundays for the purpose of delivering mail to the general public." This does not affect the prompt despatch of letters sent for special delivery.

This is a reform which we have previously favored. There is in it nothing political. It was enacted by a Democratic House, but introduced by the Republican leader, Congressman Mann, who has been for some time its special champion. It met with no opposition in Congress, but as soon as the Department began to obey the law a swarm of criticisms and objections began to buzz about the ears of Postmaster-General Hitchcock, and it was charged that the provision in the Post Office appropriation bill was a 'joker," surreptitiously introduced and past by inadvertence. This is not at all the fact. For years the New York Letter Carriers' Association has carried on a vigorous campaign for the abolition of Sunday delivery, and it has spread its literature broadcast. Our attention has been called to it again and again from that source.

Postmaster-General Hitchcock, who heartily supports the law, makes it clear that its operation will not do any serious wrong to any one. The law is explicit. It forbids general delivery of mail on Sunday, but not special delivery. Any person or business that needs to receive mail on Sunday can have a lock-box and take out its contents on Sunday. Hotels which accommodate transient visitors can thus, or otherwise, get mail for their guests. But the windows will be closed to the general public, and the ordinary letter carriers' service will be discontinued. If there is need for a letter being received it can have the special delivery stamp, and we presume there will be a considerable increase in this source of revenue. Of course, letters will be collected and sorted as usual, and sent to their destination.

If the reader asks why the provision applies only to the larger cities, the answer is a curious one. It is the Sunday paper that is responsible for the omission of country districts from this provision for Sunday rest. On Sunday the country people have leisure to go to church or to the post office to get the five-cent issue of the Sunday papers, comic supplement and all. It was to favor these small towns that Congressman Mann consented not to make the provision apply everywhere. The larger towns and cities are supplied by newsdealers and do not depend on the post office. The new provision of law does not disturb them.

We heartily approve this provision of law for a rest day for as many post office clerks as possible, not because Sunday is the Lord's day, nor because it is the Christian Sabbath, but simply because one day of rest in seven ought to be allowed to all, and Sunday is the most convenient day for the general public. In Morocco it would properly be Friday. There is a Lord's Day Association of the United States which has for three years been aiding the letter carriers in this reform, but its very name makes it sectarian—a Jew cannot be a member. And yet a Jew may properly support this law. Politically ours is not a Christian, nor a Jewish, nor a Mohammedan country, altho by the preponderance of religious faith we are Christian. We should keep it in mind when we support a law for Sunday rest that we do not desire or support it as religionists, but as philanthropists. We proclaim this right of rest for all. Similarly we urge the closing of saloons on Sunday, not because it is the Christian Sabbath, and not because of the authority of the Fourth Commandment, but because the saloon is an evil influence, and we will close it from Monday to Saturday if we could, and while we can't, we will give the saloonkeeper and his clerks one rest day, whether he wants it or not.

In our complex civilization, and particularly in the cities, we find that the Christian Sabbath has necessarily lost much of its ancient sanctity. The railway service, the street cars, the telegraph and telephone and the post office all have to keep running on Sunday, as does an iron blast furnace. All this is as necessary as is the labor of the sexton who cares for the church furnace. But

the reason for a rest day, which is exprest in the Hebrew word *Sabbath,* which means rest, remains permanent. The Mosaic reason for it, that man and beast may rest, holds strong ever. The Fourth Commandment may be regarded as ritualistic rather than essentially ethical, but that does not annul the reason for it. Not even the fact that neither the Gospels nor the Epistles require Sabbath observance as a religious duty, relieves us from maintaining a rest day. It is rooted in human nature, in muscle and brain; and it is to the glory of the religion proclaimed by Moses and announced from Sinai that it discovered this great law of rest, and made it a religious ordinance, like sacrifice and worship. Paul allowed his Gentile converts to exercise their own judgment as to the Sabbath; and Jesus spoke of it only to relieve its strictness, and to tell us that man was not made for the Sabbath; but the rest day, for worship and social life, yet chiefly for rest, cannot be given up, and post office clerks have a right to its privileges, up to the limit of the comfort of the public at large.

The Fictitiousness of Fiction

SOMETHING over three thousand new novels were published in the English language last year. Probably more this. As for the serials and short stories that fill the magazines and newspapers but do not attain the honor of cloth covers, no one would venture to compute their number, still less how many persons read them and how much time they spend at it. It would indeed be a profitless speculation, for the one important question is how many people believe the fiction they read and how much. Advertisements nowadays are keyed and we can tell exactly what influence they exert, but there is no way of telling what is the effect of a romance. It must have some effect on every reader and on some a good deal. One must in the reading of it give it a certain speciousness of credence, otherwise we take no interest, and, having for a time surrendered ourselves to its pretensions, it is not supposable that we erase all trace of it from the mind when we turn the last page. Fiction is designed expressly to deceive us by its semblance to life, and it does, even the most skeptical of us.

But in so far as we are induced to accept it subconsciously at its face value we are harmed by it. For it is all false, every word of it, and for the most part wofully misleading as a guide to life. We have got past the age when we were misled into longing to be cowboys or pirates; we have long outgrown our faith in Cooper's Indians, "an extinct race that never existed," as Mark Twain calls them. But no doubt we do much more foolish things nowadays thru unwitting imitation of the people in books. Shaw says that "ten years of cheap reading have changed the English from the most stolid nation in Europe to the most theatrical and hysterical." What would be their conduct if they had devoted the decade to Shaw's novels and plays we do not like to imagine.

All art necessarily consists in falsification. The artist must select, eliminate, distort, rearrange, reduce and exaggerate in order to produce his desired effect. But this prevarication does no harm except in literature, for this alone of the arts has any considerable influence on conduct. A Gothic cathedral is exaggerated as to hight, but the tourists who admire it do not thereby add a cubit to their stature. Music consists of exaggerated and artificial sound, but after hearing an opera the men do not talk like Fafnir and the women do not yodel like a valkyr —or if they do they are soon cured of it. It would not do our young men any harm to try to look more like the Apollo Belvidere, and, as for the young women, we know of some who would be decidedly improved by the imitation of the Venus of Milo.

But with novels and dramas it is different, for here life is presented and conduct portrayed. It is, however, impossible to present life in its entirety and to portray conduct correctly. Even if the author knew the truth and wished to tell it he could not. Most novelists, however, do not know any more than other people about what life is, and they often know less about what it ought to be. They may seem to be masters of psychology and profess to have a profound knowledge of human nature, so as to be able to foretell the actions and destiny of

any set of characters they have introduced, but editors and literary executors know how thin the pretense. The logical ending, the inevitable outcome, is it not generally the result of much perplexity and many trials, in which the taste of the proposed publisher and the desires of the hoped-for readers are influential factors? Did not Kipling, sure craftsman as he is, provide alternative endings to "The Light That Failed"? Did not Ibsen, the dramatist of inexorable destiny, modify the last scene of "The Doll's House" in order to get the play upon the Berlin stage? Imagine an astronomer sending in the following statement:

> There will be a transit of Venus across the sun's disk from right to left on April 29, 1913, at 4:35.2 p. m.

Then, after a little further deliberation, adding these lines at the bottom of the page:

> Note to the editor of the Ephemeris: If you think that will not suit the public, make it "left to right" or "a. m." instead of "p. m."

"The logical ending" is most to be distrusted, for life is not logical. The climax at the end of the play or novel is most unreal, for in reality it would be followed by an anti-climax, since there is no curtain or last cover to stop the stream of life at the most dramatic point. A truthful novel would read more like Pepys's diary than like a romance, for this has neither beginning nor end, plot nor system, and it tells of a real man, who, unlike the heroes of fiction, went to sleep at night and woke up in the morning and ate three times a day and took things as they came, business and pleasure, great things and small, actions and emotions, as do all of us.

Truth is stranger than fiction, they tell us when we object to some of the inventions of the romancers. Very likely, but we are not talking of probability but of actuality. That is the fault of the fictionist, his story is plausible but real life is not. His imagination is limited, real life is not. The experienced novel reader can guess the ending nine times out of ten when he is half way thru the book, but he cannot guess how his own life is going to turn out.

Fiction began in fairy tales, and it has never got beyond that stage. It was never less reliable than now when it makes most pretension to veritism. The absurd codes of honor, the erratic ethics, the impossible actions, the incredible transformations of character, the inexplicable misunderstandings, that make up the novel of today should prevent it from being taken seriously. Certainly anybody who attempted to behave as people do in the novel world would get into no end of trouble, and deserve to. Perhaps this flood of fiction is the cause of much that is hard to understand and still harder to forgive in the conduct of our contemporaries. Those who live in a dream world are mere somnambulists in this.

A Useful Army and Navy

RARELY does the most experienced reader of up-to-date progressivism find so many high-explosive ideas in less than a dozen printed pages as Prof. J. McKeen Cattell has packed into "A Program of Radical Democracy" in a recent number of the *Popular Science Monthly*, and among these none is more revolutionary than the proposition to make useful functioning bodies of the world's armies and navies.

Professor Cattell would have universal suffrage, the votes of children being cast by their parents. He would have actual and final payment of all national, State, county and municipal debts. He would have progressive taxation of inheritances and incomes, and a progressive tax on corporations. He would have a maximum day's work of eight hours and a minimum wage of two dollars. He would have the homes and tools of production owned by those who use them. And he would have radical changes in governments and constitutions to make these experiments possible. These are radical proposals, sure enough, but in substance all have been made familiar to the twentieth century reading public thru the various channels of socialistic propagandism.

And even if they were entirely new, who could think them so startling as the suggestion that armies and navies could be made, so to speak, self-supporting? Peace societies we have, and a world-wide protest against militarism, but the peace folk would like to abolish armies

and navies altogether, or at least to reduce them to negligible proportions. Professor Cattell would keep them useful organs of a democratic society.

Idling in barracks, in Professor Cattell's opinion, is a device for promoting war, drunkenness and disease. And while thousands of men are thus taken out of the useful employments, there is pressing work to be done in all manner of engineering enterprises, the health service, the inspection of food and police duty in towns and rural regions. Let the army then do this work. The engineers, the health officers, the inspectors of food, and in general the officials of nations, States and municipalities should at the same time be officers of the army, and the force serving under them should be enlisted men, subject to drill and discipline. We should then have at all times a well-organized and efficient army for defense. It would be an institution for education, instead of for demoralization, and could be maintained at comparatively small expense.

As for the navy, it should be also a merchant marine and should be employed in maintaining a passenger, postal express and freight service to all parts of the world. The cost of an idle navy would keep up five to ten times as many ships as we now have and employ a correspondingly large number of men in useful work. Both army and navy could be made as nearly self-supporting as the post office.

It is safe to presume that Professor Cattell cherishes no illusions upon the immediate realization of this plan. The real efficiency of the army and navy would be disclosed—at Washington—when the bill to put these suggestions in operation was introduced in Congress. The idleness of barracks would give way to organized activity in an astonishingly short time and the bill would take its place in the long history of Congressional curiosities.

Nevertheless, it is a pity that a beginning at least should not be made upon so sane a program. In engineering and inspection work, especially, a great deal of good practical service could be rendered by the army organization, and beyond a doubt a postal, express and passenger service could be maintained with the lighter and swifter ships of the navy. But—the whole project is too commonsensical to be taken seriously by "practical" politicians.

A Select Jury

Occasionally in trials at law special knowledge is required of a jury. Any ordinary jury taken at haphazard will not do. Accordingly a select jury is chosen to decide with unusual intelligence.

Such a jury, on a wider scale, is the American Bar Association. On certain subjects that may be referred to it, it can speak with special authority, an authority that is very nearly ultimate. On the question of the tariff or of woman's suffrage it could speak with no more authority than any other fairly intelligent body of citizens, but on the question of the recall of judges it is an expert and select jury. Its members are the choice of the legal profession, selected out of the select, and the question of the recall of judges is one that comes in its purview. It is something that lawyers, and lawyers of the highest class, can have a professional and conclusive judgment upon. And that judgment the American Bar Association has exprest forcibly and with unanimity. They say:

> "We maintain that the recall applied to judges will tend to deprive the public of judges of ability, character, high sense of duty, and a due regard to enlightened public sentiment, and that such a judiciary is absolutely necessary to the existence of a constitutional democracy."

The Bar Association sees no fundamental objection to the recall as applied to ordinary officials; but to apply it to judges it says is "in violation of the principles of government which ages of experience have demonstrated to be wise." We have in all the States the right of impeachment of a judge who proves unworthy or incompetent, and in some States a judge can be removed by the legislature. If any further method is needed it can be provided, but only with the presentation of charges and the right of defense, which the recall does not allow. The bar associations of many States have spoken to the same effect as now has the American Bar Association, and steps have been taken by the bar associations against the recall in four of

the six States which have adopted it. That Mr. Roosevelt and his Progressive party should have against them the total weight of the American Bar Association is a fact of great importance. It will tell against him with the people. It is likely, however, that in the campaign the recall will not be strongly urged, but the subject will be allowed to lapse when it is seen that the movement is hasty and ill-considered. It will be left behind, or thrown overboard, like Mr. Bryan's silver heresy which experience has condemned, leaving only the memory of past unwisdom.

On one other subject, which has attracted much attention, the American Bar Association has taken action in part good and in part bad. It allows three negro lawyers who had been lawfully elected to retain their membership, notwithstanding efforts made to annul their election. As champions of law, as a select jury deciding a case on its evidence, its members could do no otherwise, and it is to the credit of the association that it would not revoke its action. It is also greatly to the credit of Attorney General Wickersham that he led the defense of his assistant, William H. Lewis, against whom the campaign for expulsion was directed, and it is equally to the credit of the Administration of which Mr. Wickersham is a member. In his act we see the judicial mind of the President and of the entire Cabinet. If the rights of the negro are not safe in the hands of the Republican party they are safe nowhere.

But we cannot approve the action of the Bar Association in the subsequent action as to the future admission of negro lawyers. The resolution adopted reads:

> "Resolved, That as it never has been contemplated that members of the colored race should become members of this association, the several local councils are directed if at any time any of them shall recommend a person of the colored race for membership to accompany the recommendation with a statement of the fact that he is of such race."

What does this mean? Does it mean that it has been contemplated that members of the colored race should not become members? That seems to be implied. But it should not have been contemplated to exclude them, any more than to exclude those of German or Irish or French race. Nor has it been universally so contemplated, for these three men with a fraction of negro blood were recommended from the State bar associations of which they were members and where they were known as lawyers of commendable ability and character. To make this new rule is to put a stigma upon certain lawyers, as if their shaded skin were an objection to be considered when they make application.

We have spoken of the American Bar Association as a select jury. So it is on all matters related to law. It can speak with authority on the recall of judges. It can advise wisely as to uniform legislation on marriage and divorce, as it has done in the past. It can and has judged wisely as to the retention of their membership by three members of the colored race legally elected. But the prejudice of race is not a matter professionally related to the law, on which lawyers are technically expert. That is a matter of ethics as applied to society. This new rule was adopted not because it is right, but because it seemed expedient to avoid the withdrawal of members who have not yet got over the idea that the negro is less than a man, and that the Declaration of Independence applies only to the Caucasian race, and that the abolition of slavery was a mistake. This resolution is an indignity to which negro lawyers should not tamely submit. As those appear who are worthy of membership we trust they will seek it, and keep the matter hot. It is not a case for submission and peace, but for the demand of equal privilege. Just as women should not refrain from demanding and seeking their equal legal privileges, so colored lawyers should insist on not being rejected as unworthy of membership because of their parentage.

Will some one tell us why the American Bankers' Association can give full privileges of membership to a Virginia negro, and allow him to attend the annual meeting even in an extreme Southern city, and without serious complaint, while objection is made to the admission of a colored lawyer to the American Bar Association?

The Income Tax

When the new millionaires, who so rapidly multiplied just after the Civil War, found their taxes leaping up, in proportion to the capital that they commanded, they very naturally inclined to shirk responsibility. Most of them received the decision of the Supreme Court that an income tax was unconstitutional with satisfaction. Mr. Carnegie tells us that that day of dodging has passed, and he for one welcomes the day when the big hoards will be compelled to stand the brunt of taxation, for their own good as he expresses it, because it is a just system of taxation. It is certainly a sign of progress when a man with a hundred thousand income is not satisfied to pay the same ratio on his income as his washerwoman, who supports her family on five hundred dollars a year. Adam Smith laid down the law that every one should contribute to the public welfare and to the support of government in proportion to the income which he received. This law is very generally believed in in Europe, and acted upon. The United States is now in the spirit of reacting from indirect taxation to the direct. There seems to be no substantial basis to the complaint that an income tax cannot be collected. It certainly will be collected when the moral spirit and the common sense of the people combine to endorse it.

A Cheap Substitute for Eating

The cost of living can be reduced by not eating. This, of course, will necessitate tightening one's belt occasionally to take in the slack, and the work of Dr. Lennhoff as told in an interesting account published in *Vossiche Zeitung* makes clear why it is that this expedient helps make up for the lack of food. Experiments performed on both sane and insane people (in order to eliminate the power of suggestion) demonstrate that the mere act of swallowing causes a contraction of the stomach. If a preliminary contraction has been made by means of belt tightening, satiation of the appetite occurs more quickly. It is interesting to note that if the food is fed to the stomach thru a tube, in place of being swallowed, the tightened belt has no effect. The conclusion reached from the series of experiments is that the act of swallowing is what produces satiation. Hence, the moral to be observed is, first, tighten your belt, and second, swallow your allowance in small doses and often. But it is well before going too far to recall the story of Mike's dog who "just as he got used to living without eating, up and died."

Swindlers

The "promoter" takes advantage of every genuine movement for the benefit of the common people, to turn it to his own advantge. He has swamps for sale as gardens of Eden. After you have turned over to him your bank deposit, he will cultivate the farm he has sold for nothing, and at the end of ten years he will turn it over to you in a condition to keep your old age from care and labor. It would be impossible to get even an approximate estimate of the money that he has stolen from the poor, and the sums that have been cajoled away from the middle classes, leaving poverty everywhere along the way. Religion and religious papers have been taken advantage of by fraudulent clericals, and our daily press has been altogether too easily subsidized by corporate speculators. Kansas has taken this matter in hand, and passed a law compelling "get rich quick" companies and associations to show their actual assets. Such a law is needed in every State in the Union. Florida and California particularly have sad stories to tell of industrial savings and loan companies, selling stock and promising delightful homes, but whose assets covered nothing more than swamps or sand dunes, if even that. The old soldiers fell into the pit, and hundreds of ministers have been persuaded to give up their savings for fakes to juggle with. Florida has the matter in hand and promises legislation along the Kansas line. One of the Texas papers points out that in that State the victims are from the very poorest classes. The corporate scoundrels do not hesitate to take the last dollar of widows. They like to do business with people of moderate means, who cannot fight them in the courts. The Kansas plan is

right, bringing them to judgment before they have made a free campaign and worked all the mischief they desire.

Simplified Portuguese

The Government of Brazil undertook to reform the spelling of Portuguese. This was some years ago, and the simplification, which was needed, is a monument to the Brazilian Academy. What was the Portuguese standpoint?—for it is only a hundred years since Brazil was a colony of the European country. What the point of view was so long as Portugal remained a kingdom we do not know, but we find it reasonable to suppose that the authorities, at least, scorned the reform as the English conservatives, represented in journalism by the *Saturday Review,* for instance, would scorn an American simplification of the difficulties of written English. It would, perhaps, be rash to assert that there is any connection between standpat spelling and monarchical government, as against simplification and republicanism, but the fact remains that today Portugal is a republic, and that her Government has adopted the reforms of the daughter republic in South America. Some of the changes are highly logical: the *h* is suppressed in *rh* and *th; ph* is replaced by *f,* and *ch* (having the value of *k*) by *qu.* Moreover, the superfluous consonant is dropped in the case of words where the second twin—if we may so denominate a consonant—is voiceless. THE INDEPENDENT long ago took this step in the case of such English words as *traveler*—still spelled travell*e*r by old-fashioned persons in this country—and, doubtless, even by some of Lloyd-George's supporters in Great Britain. A French review, commenting upon the changes in Portuguese orthography, notes that French is now the only Latin language presenting the groups *ch* (hard), *ph, rh, th,* and the unpronounced double consonants.

Dramatic Criticism

When we read in the Tombstone *Clarion* that "reports from Wausau are that John Huckbody lost thirty chickens by freezing to death," we are sorry for John and wish that Tombstone newspaper men might be sent to school for a course in grammar. Otherwise it is easy to maintain our wonted cheerfulness. When, however, the dramatic critic of the Chicago *Tribune* writes such a sentence as this: "If Mr. Parker wrote fewer plays he would write more plays like 'Rosemary' was and like 'Pomander Walk' is said to be," we shed a tear; for the Chicago *Tribune* is one of the best newspapers in the land, and in its criticism ought to use as good English as, let us say, a high school boy of sixteen. Ignorance of syntax and of fact discredit too many of those journals and individuals who write about the stage in America. Thus it is the New York *Sun* that announced last season Madame Simone's appearance in "'La Princesse Lointaine' and other plays of Bernstein's." That, of course, was a merely literary error, but the Philadelphia *Ledger,* in discussing a play presented by the Dublin company of actors, writes of "the chiefest objection," while the Philadelphia *North American,* on the same day, says of "Keats's" (*sic*) "Kathleen ni' Hoolihan" (*sic*) and Synge's "Playboy":

> "These dramas may fitly be regarded as compliments (*sic*) to each other. The first is an exquisite allegory, a metaphoric and touching presentation of Ireland, the Niobe of Nations. The second is the reverse of the model; an ironic, witty and brilliant disclosure of the frailty, as well as beauty, of certain phases only of Gaelic character. Henrik Ibsen, in his 'Peer Gynt,' and Alphonse Daudet in his 'Tartrain,' (*sic*) did respectively (*sic*) for Norway and the Provence something akin to what Synge has accomplished in his 'Playboy.'"

Such comment as this, as pretentious as it is uneducated, is generally confined, in our American newspapers, to theatrical affairs. To the theater city editors send incompetent reporters whom they would not trust to report an event so important as a fire, an automobile collision, or a dog fight raided by the police. The American drama is neither profound nor exalted, and we are seldom granted an opportunity to see unadulterated French, Scandinavian or Irish plays; but our stage has now reached a point of development which deserves better of the republic. Let the editors either decide to pass it by in silence, printing only the puffs which come to them with their ad-

vertising, or let them treat the theater as well as they do baseball games and divorce suits.

Place Names

Place names encountered in American travel serve as a constant reminder of the part which Latin Europe played in discovering and charting the New World. Even mispronunciation cannot conceal the French and Spanish origin of these names. From much farther West than the "Soo," as far East as Grand' Manan, and as far South as New Orleans, we find the traces of French missionaries and adventurers. It is within a few months only that a monument to Champlain has been unveiled on the shores of the lake which bears his name. Simon de Champlain it was, no less, who gave its name to Mount Desert Island. The name originally ran *l'Isle des Monts désert.* Visitors to that playground of our Eastern World remember Cadillac's Cliff and the Jesuit Spring, but may not know that half the island was once granted by the American authorities to a French claimant. How many natives of Vermont (another French name!) realize that St. Johnsbury was named for St. John de Crèvecoeur, author of those delightful eighteenth century "Letters from an American Farmer"?

It is not strange that the Welsh do not like the superior pretensions of the Established Church. It has been the custom at the opening of the Assizes to have a religious service, and the sheriff of a Welsh county asked a Nonconformist minister to conduct it. But when the Bishop of Bangor heard of it he wrote the minister as follows:

"With regard to the Assize service, as the service will be held in church, and will consist of Litany, hymns, and, if the judge wishes for it, a short sermon, I am extremely sorry to say that there is no part in it which you can take."

It appears to us to be a *non sequitur,* for the service, with the consent of the judge, might be held in some other place not under control of the rude bishop.

It is perfectly proper that post office clerks should have their associations for their common benefit, such as the Railway Mail Clerks' Association. Such organizations have already done good, particularly in urging legislation to reduce Sunday labor. But that an association of Government employees should be members of the Federation of Labor is another thing, for the only object of it would be to get strength in a strike against the Government. A strike in the army would be mutiny. What chance would there be for a strike in a Socialistic government?

The United States Department of Agriculture has discovered that the addition of five or ten per cent. of oil to concrete will make it impervious to water. Petroleum residuum is used and it is mixt thoroly with the sand and Portland cement. This removes one of the chief objections to the use of concrete for walls, floors, tanks and silos. Bulletin No. 46 of the Office of Public Roads gives details.

To those who have just returned from their vacations in woods or by seaside, and whose ears are split by the urban discords to which they are not yet attuned, we dedicate these lines by Saint-Evremont, written in 1691:

"The cabmen are brutal; their voices are so frightful and the snapping of their whips augments the noise in a manner so horrible that it seems as if all the furies were leagued to make Paris a hell."

And in those days there were no motor cars!

A French review congratulates itself that the Frenchman consumes only one and a half kilograms of coffee annually, while the German uses two and a half, the American three and a half, the Belgian five and a half, the Turk six and a half, and the Brazilian seven. The Englishman contents himself with one pound only, and those of us who best know English coffee don't wonder at his temperance.

A landlord of Sartrouville, a town on the banks of the Seine, has tacked up this notice on his house: *Price of rent,* $50. *Discount of* $2 *per child.* American landlords please copy.

According to political experts the next President must be either James S. Sherman, Philander C. Knox or Thomas R. Marshall.

Insurance

Educating the Public

For several years past the value of educational work among the public has been steadily appreciating in the minds of insurance company managers, and the example set by the old line life insurance organizations in the formation of the Association of Life Insurance Presidents in 1906 has finally been emulated by the fire, casualty and surety and the industrial accident and sickness branches of the business. At its annual meeting last spring the National Board of Fire Underwriters, referring to the valuable results achieved by the Association of Life Insurance Presidents, raised a committee and authorized it to undertake the organization of a bureau of education; in August, at the annual meeting of the International Association of Casualty and Surety Underwriters, an association of presidents was formed to complement the work being done by the association's bureau of publicity established two years ago; and at Detroit last week the Detroit Conference, an organization composed of companies writing industrial accident insurance, and the National Fraternal Congress, composed of fraternal life insurance orders, meeting at Mackinac, Mich., voted for the establishing of educational bureaus.

These events indicate the permanent passing of the old order in the realm of insurance and the arrival of the new. There was a time when associations composed of insurance companies preferred to have their activities remain unnoticed by the general public, not because what they said and did was in conflict with the interest of their patrons, but because the latter, possessing little knowledge of the subjects discussed, were too often misled by skilful perversions of their words and actions perpetrated by designing politicians and sensational newspapers. It is candidly admitted by those outside the insurance business who understand its principles and practices that it has been peculiarly a victim of unwise legislation. Legislators have usually meant well; their laws were designed to cure some real or fancied defect that seemed injurious to the buyers of insurance protection; but their knowledge of the defects, their nature and cause, were not sufficient to enable them to find proper remedies. The great majority of all the so-called corrective laws are obstructive, restrictive or destructive in their effects, and, while they may result in extirpating a minor fault, because they are formulated in ignorance of the economic system underlying the whole fabric of insurance, they injuriously affect all its operations.

The companies are wise in undertaking a campaign of education, and it now seems incomprehensible that they have so long delayed embarking on a piece of work so essential to their welfare. True, it is a branch of business which of necessity must be by nature exceedingly cautious and conservative. It may not lightly depart from principles that time has proved sound and safe; it is not justified in experimenting with new schemes. But it will be abundantly rewarded in not only taking the whole public into its confidence but in teaching them to the fullest practicable extent the intricacies of the business. It is safe to assume that no intelligent buyer of any commodity or service will complain at the price he is asked to pay if he is convinced that, all the elements considered, it is reasonable. And in insurance, as in everything else of a business nature, the price is the crux of the matter. Educate the premium payer; demonstrate to him that certain laws increase the cost of insurance; prove to him that his policy would cost less if such laws were not in existence. He will then solve the problem.

The people of the United States have demonstrated the possession of an extraordinary genius for insurance of all kinds. We support a greater number of companies than any other nation; their aggregate assets greatly exceed those of any other country; we have more people insured and the volume of insurance in force is so great the mind cannot comprehend it when stated. Under the educative systems now proposed and in operation all these results wil be tremendously augmented in a few years.

Financial

The Condition of Business

LAST week was a dull one on the Stock Exchange, sales falling to 1,337,995 shares from 1,916,633 in the week preceding. Prices showed very little change, but a slight advance was noted in the three leading active issues—Reading, Union Pacific and Steel—in which 35 per cent. of the business was done. A hardening of money rates here was regarded as indicating a further advance in the near future, and the Bank of England increased its discount rate from 3 to 4 per cent. Reports as to the condition of general trade were distinctly favorable. This is shown by the following statements of two leading authorities:

Dun's Review. Advices from leading cities both East and West with scarcely an exception speak of a bigger volume of trade, larger advance orders, better employment of labor and a growing confidence that the now practically assured crops make the future secure. In every part of the country business optimism is the rule and all other considerations are practically ignored in the light of the conviction that a period of national prosperity has set in which only some great and improbable calamity could stop.

Bradstreet's. Business conditions are even more reassuring than heretofore. Crop developments continue exceptionally favorable, industrial operations are moving at a swifter pace, labor is in scant supply, both in mill and field; buying for fall, winter and next spring is of larger proportions, money is in more active demand, currency is going to the country in larger volume, a general shortage of railway cars in another month seems certain, the pig iron trade displays marked activity and finally collections are gradually improving, with further betterment likely to ensue when the marketing of crops is on a larger scale.

"The prospects before the iron and steel industry," said President Farrell, of the Steel Corporation, "are brighter than at any time during the last two years." Prices of pig iron and wire products were increased. The almost unprecedented rains in Great Britain, with continuous wet weather in France and Germany, preventing the harvesting of grain or seriously affecting the quality of it, have caused a sharp export demand for our wheat and oats. British farmers' losses by rain in August are estimated at $35,000,000.

....Late reports show that this year's cotton acreage is a little less than last year's.

....Imports of diamonds, pearls and other precious stones at the port of New York during the last fiscal year amounted to $39,445,289.

....Of the 4,451 free homesteads taken in Canada's prairie provinces during April, 1,199 are held by immigrants from the United States.

....Railroad gross earnings in June showed a gain of 7 per cent., against 3 per cent. in May and 2½ in April. Increases for the first half of the year were about 4½ per cent. gross and a little less than 1 per cent. net.

....A New York syndicate, of large financial resources, has bought 15,000 acres at the mouth of the Brazos River, in Texas. It will build there a city and port and will develop extensive sulphur deposits underlying the land.

....The value of the automobiles exported from this country in the last fiscal year was $30,000,000, and the average export price of the machines was $990. Imports were $2,000,000, with an average of $2,216. Manufactures of automobiles in the United States in 1910 amounted to $249,202,000.

....According to a report issued in London last week, the outputs of the three leading producers of pig iron in 1911 were as follows: United States, 23,649,344 tons; Germany, 15,535,112; Great Britain, 9,718,638. The United States produced 37 per cent. of the world's output.

....Edgar L. Marston, of the banking house of Blair & Co., deplores the fact that this country, in spite of what nature has done for it, has allowed Germany to surpass it in industrial development. International competition in manufacturing, he adds, is now practically confined to Germany and the United States, and is an excellent stimulus for both countries.

The Independent

VOL. LXXIII NEW YORK, THURSDAY, SEPTEMBER 12, 1912 No. 3328

Survey of the World

The Political Campaign

At the election in Vermont, on the 3d, the Republicans failed to show a majority over all, and the choice of State officers was left for the Legislature, which, it is expected, will elect the Republican candidates. According to the latest reports, the votes were cast as follows: Republican, 26,259; Democratic, 20,350; Roosevelt Progressive, 15,800; Prohibition, 1,443; Socialist, 1,181. Comparison with the similar election of 1908 shows that the Democrats gained 4,397, while the Roosevelt and Republican total gave a plurality over the Democratic vote of 21,709, against 29,645 four years ago. Substantially all of the Roosevelt votes were drawn from the Republican party. The result is considered in our editorial pages.——In Ohio, on the same day, forty-two constitutional amendments were submitted to the people and all were adopted except the one for woman suffrage and, possibly, the one abolishing capital punishment. Among the amendments adopted are those providing for the initiative and referendum, power to fix a minimum wage, eight-hour day on public works, abolition of prison contract labor, preference primaries, income and inheritance taxes, double liability of bank stockholders, home rule for cities and licenses for saloons.——In Ohio, the Roosevelt party has nominated Arthur L. Garford for Governor.——Senator Cummins publishes a statement saying he will vote for Mr. Roosevelt, but he opposes the nomination of a third party ticket in Iowa. Mr. Taft, he says, is not a Progressive and was nominated by a minority.——Senator Bourne will support Mr. Roosevelt. Seeking to explain the letters in which the latter declined to accept him as an intermediary in behalf of the Standard Oil Company, he says that in 1908 he took Mr. Archbold to the White House, desiring to promote the enactment of a Federal incorporation law and in this way to solve the Trust problem. He also sought to prevent a continuation of the panic by bringing about a settlement between the company and the Government. Mr. Archbold was in favor of Federal incorporation.—— It is expected that Mr. Roosevelt will testify on October 2 as to campaign contributions. Probably J. Pierpont Morgan will be a witness, and the committee may decide to summon John D. Rockefeller.——At the California primaries, last week, there was a large majority for the Roosevelt-Johnson organization's control of the Republican State convention. This shows that Roosevelt electors will go on the official ballot and that the supporters of Mr. Taft must resort to petition.——In notifying Aaron S. Watkins of his nomination for Vice-President by the Prohibition party, Clinton N. Howard characterized other nominees as follows:

> "Taft is a milk-fed elephant, with a broken tusk; Wilson is a lion's whelp, clean of tooth and claw, led by an ass; Roosevelt is a 'great and mighty wind,' which raises the dust and creates political astigmatism among the people."

In an address at New London, Mr. Taft opposed the Democratic bill which provided a seven years' tenure for Government clerks in Washington. No old clerk there, he said, need fear discharge during his term of office, unless there

were provision by law for a civil service pension to keep him from want in his old age. Benedict Arnold, he remarked, had given us a warning not to follow a selfish ambition and to desire "to crawl into power over some one else." No one who studied the brilliancy of Arnold and his ambitions could fail to regret that love of self and desire for power had led him "into that path which made him the greatest traitor of our times."——Governor Wilson will oppose ex-Senator James Smith, Jr., who has filed a petition announcing his candidacy for the national Senate at the approaching primaries. Mr. Smith says he is a Progressive and an earnest supporter of Wilson and Marshall. The Governor will soon make a tour in the Middle West. Speaking at Buffalo last week, he attacked parts of the Roosevelt platform, asserting that provision for a minimum wage was in the interest of employers and decidedly to the disadvantage of workingmen; also, that the new party proposed to legalize monopolies.——Mr. Roosevelt went westward on the 2d, intending to make speeches for a month. At the end of last week he was in Montana. In the course of his addresses he has said that Governor Wilson was nominated by bosses; that a great majority of Wall Street men who have been guilty of obnoxious practices in Trusts support the Governor because they know he is not hostile to them; that talk about tariff is "only a red herring drawn across the trail to divert attention from the work of social readjustment and industrial reform"; and that adoption of free trade would be ruinous. He ridiculed the assertion that he wanted to rule like a king. "Other things I might like to be," he said, "but not a king. The constitutional monarch of the present time comes nearer being a cross betwen a perpetual Vice-President and the leader of society's Four Hundred than anything else I know."——Secretary Stimson, Mr. Roosevelt's candidate for Governor of New York two years ago, says that Mr. Roosevelt "has done more harm to the advancement of pure political and better governmental conditions than any other one man or combination of men that has meddled with political affairs in a great many years."

New York's Roosevelt Convention

At the New York State Convention of the Roosevelt Progressive party, held in Syracuse last week, Oscar S. Straus, who has been Minister to Turkey and Secretary of Commerce and Labor, was nominated for Governor, and F. M. Davenport for Lieutenant Governor. The latter was temporary chairman and Mr. Straus was presiding as permanent chairman when he was nominated. A full State ticket was named. The nominees for Judges of the Court of Appeals are Carlos C. Alden, dean of the Buffalo Law School, and George W. Kirchway, recently dean of the Law School of Columbia University. For the first place on the ticket there was a contest between the friends of William H. Hotchkiss, chairman of the State Committee, and the supporters of William A. Prendergast, Comptroller of New York City. Both had been placed in nomination (altho Mr. Hotchkiss attempted to withdraw his name), and the roll was about to be called, when a picturesque delegate known as "Suspender Jack" McGee leaped upon the platform and in a brief speech nominated Mr. Straus. Either Mr. Hotchkiss or Mr. Prendergast, he said, would cause friction. The convention enthusiastically accepted his suggestion, and Mr. Straus was placed at the head of the ticket by acclamation. He is one of the seven arbitrators who are considering the application of the railroad engineers for an increase of wages. He is also a brother of the late Isidor Straus, who was lost with the "Titanic." The platform adopted is a very long one. Originally it contained 8,000 words, but its length was reduced. It reaffirms the national platform and adds many provisions for local application. The party stands for a real direct primary law, a corrupt practices act, woman suffrage, the initiative, referendum and recall, constitutional amendment by petition, the short ballot, home rule for cities, the merit system, reform in court procedure, abolition of grade crossings, extension of the forest reserve, and repeal of unused or abandoned franchises. It would empower the Governor to invoke a referendum on a bill recommended by him, but not accepted by the Legislature. There are also many provisions

for the benefit of workingmen and farmers.

Trust and Railroad Cases

In the suit of the Government against the Shoe Machinery Company, under the Sherman act, Judge Putnam, at Boston, ordered that the hearings should be held in private. This was done against the protest of the Government's prosecuting officers, who said, in their brief:

"Nothing, it seems to us, can afford a greater menace to the stability of our judicial system than that the court should make to the public, in a matter which so greatly concerns it, the announcement: 'You have no right to enter here or to listen to what the witnesses are saying. That it is of vital moment to you is of no consequence. The interests of the United Shoe Machinery Company and its officials are paramount and must be protected. The publicity which has prevailed, and which has unquestionably been recognized in other circuits with respect to these important cases, shall not obtain here.'"

Judge Norris, Representative from Nebraska, is deeply interested in the court's action. He intends to introduce a bill prohibiting secrecy in such suits, and he may ask the House to order an investigation. The Department of Justice is said to be in sympathy with him. He accuses the judge of exhibiting prejudice in favor of the company.——It is reported that the Government has not finished its inquiry concerning the American Telephone and Telegraph Company, and that it may decide to bring suit for a dissolution of the corporation.——A commission sent to England by the Department of Justice has procured evidence there to be used in the suit against the rate combination of transatlantic steamship companies.——Not long ago a considerable increase of freight rates to and from the Pacific Coast was announced by the transcontinental roads. Hundreds of protests were received by the Interstate Commerce Commission, which now has suspended the new rates until December 31. To the same date it has suspended proposed increases of rates on lumber from the Southern States to Canada.

Talk of Intervention in Mexico

At the beginning of the present week there were indications that intervention in Mexico might soon be required, altho it was known that Mr. Taft would avoid such action as long as possible and would not take the step without calling a special session of Congress and procuring authority for it. In Northern Mexico the rebels have been making raids across the boundary, looting American ranches and threatening to burn American towns. They are menacing many American mining camps on their own side of the line, and the Madero Government shows but little interest in their activity. In the South several States near the capital are in a condition of anarchy, with respect to which the Madero Government appears to be powerless or indifferent. Mr. Taft spoke with great earnestness to the Mexican Ambassador last week, and the latter at once started for the Mexican capital, where Madero has since called a special session of the Senate.——On the 3d the rebels captured Ojinaga (near Presidio, Tex.), from which 400 Federal soldiers fled without firing a shot in defense. They left much ammunition. The Americans in Cananea, menaced by the rebels, asked for 500 rifles, and Mr. Taft ordered that these be sent to them. Nacozari, where there are important American mining industries, was surrounded. It was said that Madero would ask our Government to permit a transfer of troops from Juarez to Douglas, Ariz., in our territory. Whereupon the rebels promised to burn border towns in Arizona if such transfer should be allowed. They crossed the line 15 miles west of El Paso and attempted to steal the horses of a United States cavalry company. The cavalry drove them back, killing four of them. On our side of the line, in Arizona, companies of armed men have been organized, and they intend to enter Mexico if the rebels kill Americans in the mining towns. In the South, the Zapatists last week massacred the garrison of Ajuno, in Guanajuato; sacked a town in Oaxaca, where they burned merchants to death, and sent to the Diplomatic Corps at the capital a warning, written and signed, that they intended to take the city within a few days. Nine men implicated in a plot to capture the capital have been put to death. Mr. Taft may ask Madero to permit our troops to cross the northern boundary in pursuit of raiding rebels or to rescue Americans in the mining towns of Sonora. Owing to rumors of im-

pending intervention, many Americans who have not been molested are hastily preparing to leave Mexico and to take refuge on the American side of the frontier.

The Revolt in Nicaragua

More than 1,000 United States marines arrived at Corinto last week, and 800 of them were sent to Managua, the capital. Others manned the trains on the railroad from Corinto to Managua, or were stationed at points on the line. It was the intention of the naval commander to use a part of his force in opening the railroad from Managua to Granada, where there was great destitution, to send relief to the 125 Americans at Matagalpa. These, however, were said to be safe. This week there will be 2,500 American marines and bluejackets in Nicaragua. The Government has won several battles. At Tamarinda it captured General Irias and 140 men; among the prisoners taken at La Paz was the rebel commander, Colonel Berrios, formerly Assistant Secretary of War under Zelaya; forty rebel officers were made prisoners at the battle of Tipitapa, and the rebels were defeated in engagements near Leon and Masaya. Therefore it was thought that the revolt was nearly ended. General Juan J. Estrada, who led the successful revolution against Zelaya, left his home in New York, last week, to join President Diaz and assist him. The judges of the Central American Peace Court could do nothing at Managua. As they began their homeward journey, their train (on the road to Corinto) was attacked by rebels, and the engineer was killed. The marines, without firing any shots, captured for the Government a small gunboat which the rebels had seized near Corinto. Many of the people of Nicaragua are suffering for lack of food.

Cuba

Owing to the assault upon Mr. Gibson, our Chargé d'Affaires in Havana, and the abuse of him by the local newspapers, the diplomatic representatives of other governments held a conference and sent a note to President Gomez, asking what measures he had taken to protect them. Whereupon the Secretary of State sent for the local editors. When they had assembled in his office he warned them that such attacks as they had made upon Mr. Gibson might cause international complications. They promised to heed the warning, and all of the papers but one have ceased to abuse Mr. Gibson. President Gomez explains that, owing to an order issued during the period of American intervention, and still in force, the Government is restrained from prosecuting the papers unless the offended person demands that it shall do so. He sent his secretary to Mr. Gibson, to present what was virtually an apology. In a cable message to President Taft, the Cuban Veterans' Association expresses regret and indignation, saying:

"You and your people may be assured that the loyal affection and sincere gratitude toward the nation which extended to us its hand in the difficult hour of our independence will never grow lukewarm."

The association also sent a committee to Mr. Gibson and resolved to regard any additional attack upon him in the press as an insult to itself. Several members of Congress have introduced bills prohibiting the award of contracts for national, provisional or municipal work to foreigners. The Government explains that it desired to delay the final payment on the Reilly claim because the submission of certain claims against Reilly was expected. It will present a formal protest against this payment, which was made in response to Mr. Gibson's demand.——The Liberal faction which has supported the candidacy of General Asbert, Governor of Havana, has made a coalition with the Conservative party. Some think this will cause the election of General Mario Menocal to the Presidency.——Sugar grinding has ceased, and it is known that the sugar crop, about 1,875,000 tons, was the largest on record.——Porto Rico is prosperous. Its foreign trade has risen from $16,000,000 in 1900, to $78,700,000 in the last fiscal year, when the exports were $40,000,000.

South America

What was called a German-Brazilian Congress was held in Berlin last week, the members being Brazilians residing in Germany and Germans who have interests in Brazil. The purpose of

the three days' session was to promote Germany's commerce with Brazil and German colonization projects in that country. Dr. Da Cunha, the Brazilian Minister, presided.——Press reports from Brazil say a political crisis is at hand, owing to the disagreement of Federal and State authority and a failure to enforce Federal laws in places at a considerable distance from the capital.——Uruguay's Government has decided to expend $30,000,000 in the coming eight years upon improvements in the harbor of Montevideo, now seventh in the list of the world's harbors by reason of the tonnage of ships entering and clearing. Our State Department directs the attention of contractors to the work which is to be done.——It is said that the Farquhar syndicate, which is identified with railways in Brazil, Argentina and Chile, seeks control of the Peruvian Corporation, which operates 1,000 miles of road in Peru and has valuable guano and land concessions, granted in connection with the settlement of the foreign debt twenty years ago.

Count Berchtold's Proposals

We could discuss them to better effect if we knew what they are. But just what was contained in the telegrams that were sent out from the Foreign Office at Vienna on August 13 to the Austro-Hungarian Embassies thruout the world is known only by the Governments to whom the message was communicated, and doubtless they are not altogether certain as to its meaning and significance. That it was something of importance, or at least was so regarded by its originators, is shown by the fact that when Count Berchtold visited the Emperor Francis Joseph at Ischl, a few days later, he was warmly congratulated by his sovereign upon his successful foreign policy and was rewarded by the Order of the Golden Fleece. Perhaps our readers will prefer to exercise their own wits in penetrating the veil of diplomatic language to any speculations of ours, so we quote below the only authorized statement of his policy given out to the public by the Austro-Hungarian Foreign Minister as reported by the Viennese correspondent of the London *Times:*

"The object of the Austro-Hungarian Government is to co-ordinate the several efforts made by the Powers in the interest of Balkan peace and of the *status quo.* Made unconnectedly, these efforts produce less effect than they would if harmonized and attuned to one general keynote. It is not intended to organize collective European action or representations by the Powers to the Balkan States and to Turkey. Each Power will be free to make its representation when and how it may wish, but the moral influence of its action will be enhanced if the quarters to which it is addressed know that all the Powers are substantially agreed in supporting the advice tendered. Turkey has traversed, and is traversing, a grave crisis. Her present Government is animated by good will and reforming intentions, but it will not have a fair chance of realizing these intentions unless the Balkan States and peoples refrain from harassing it. Hence the expedience of giving to the Porte organized European encouragement and to the Balkan peoples equally organized advice to be patient and not to thwart Turkish purposes. There is no question of proposing the adoption of special reforms by the Porte, nor of marking out special spheres of interest for the Balkan races, nor of any kind of intervention in the old sense of the term."

On the day after he had sent out this message to the Powers, Count Berchtold took the first overt step toward putting it into action by visiting King Charles of Rumania at the castle of Pelesch, Sinaia, and consulting with him and Foreign Minister Majoresco about co-operation in Balkan affairs, the first time an Austro-Hungarian Foreign Minister had honored Rumania by such a visit.——The proposals of Count Berchtold seem to have met with a favorable reception from the Powers, except, of course, the Power most concerned, Turkey. The Porte has declared emphatically that it could not listen to any such proposals and could not admit foreign interference in any such internal questions.

The Disintegration of Turkey

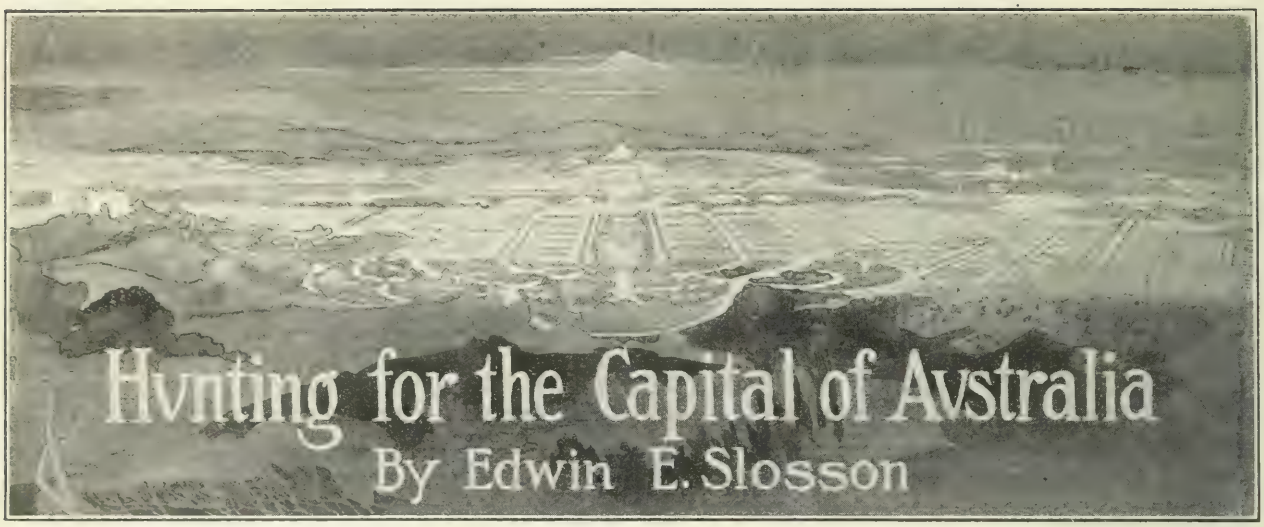
This heading might have been made a topic of discussion at any time in the last hundred years, yet certain recent and impending events necessarily bring it up for consideration at the present. To be sure, it does not appear that Count Berchtold, in his message to the Powers, used any stronger language than "a policy of moderate decentralization on ethnic lines" or words to that effect, but even that, as applied to a conglomerate heterogeneity like the

Turkish Empire, threatens serious changes. Times have greatly changed since that memorable day, January 14, 1853, when Czar Nicholas took Sir George Seymour aside and remarked to him casually that the Sick Man of the East was on his deathbed and it behooved his heirs to come to an agreement as to the division of his estate. To which Great Britain replied in a shocked tone that it would be more seemly to consider what could be done to restore the Sick Man to health than to anticipate his demise. Nowadays Great Britain would not be so ready to take up arms to preserve the integrity of Turkey. She would, in case of a collapse, be content to make sure her hold on Egypt and to keep clear the Asiatic route to India. France, which was her ally against Russia in the ensuing Crimean War, is now the ally of Russia and has more Mohammedans under her sway than the Sultan of Turkey. The King of Sardinia, who made his first appearance as a European Power on the Crimean stage as the defender of Turkey, is now King of united Italy and has seized the last of the Ottoman possessions in Africa. The King of Prussia, neutral in that struggle, is now Emperor of united Germany, and, nudging his neighbors to get "a place in the sun," obviously looks upon the plains of Anatolia as the sunniest land within reach. Austria-Hungary, having taken advantage of Turkey's embarrassment to annex Bosnia and Herzegovina, is holding the pass of Novibazar with apparent intention of some day marching thru it on down to Salonika and the sea. Here might then be the materials for a kingdom of Southern Slavs and the Dual Monarchy would become Triple. Montenegro, the invincible, has now a king, father-in-law to the King of Italy, and, in spite of the warnings of the Powers, cannot forbear giving aid and comfort to the Albanians over the border who are continuing their stubborn conflict with the Turks. Bulgaria, Servia and Rumania are all held in leash, eager for a chance to enlarge their boundaries. Crete is not to be restrained by any threats from the Powers from occasionally declaring herself annexed to Greece. Rhodes, Calymnos and Patmos, now occupied by Italy, protest vigorously against their annexation by that country, tho profoundly grateful at being relieved of the Turkish yoke. Hitherto the best defense of Turkey has been the jealousy of the European Powers. If now the negotiations instigated by Count Berchtold should remove this jealousy, she will have to rely upon her own military prowess to defend her territory against her covetous neighbors.

Mutiny at Sevastopol

It now appears that there is truth in the rumors, officially denied, of mutiny in the Black Sea fleet. Sevastopol has been declared in a state of siege, and the naval judge advocate has been arrested. The order issued by the Russian Minister of Marine alludes to the disorder in the following terms:

"The Russian navy is pasing thru a historical period. The Emperor's will has summoned it to new life, and the popular representatives have given it their confidence and abundant resources. The Emperor's will now calls it to do its duty toward traitors and to those who have been disloyal. No pardon is possible.



"The Emperor was pained to learn that the seed of disorder had sprouted up in the navy, so dear to him, but yet the contagion has spread to only a few ships. I am happy to communicate the imperial thanks to those crews which have conscientiously done their duty."

The Question of Tibet

Great Britain presented, last month, thru Sir John Jordan, the British Minister at Peking, a note insisting that China refrain from sending into Tibet the military expedition now on the borders of Szechuan. The diplomatic point made is a nice one, that is, Great Britain recognizes Chinese "suzerainty" over Tibet, but refuses to allow China to exercise "sovereignty" over that country. The British officials at Darjiling refused to allow a mission claiming to represent the Chinese republic to enter Tibet from India. The Dalai Lama, the incarnate deity of the Buddhists, who took refuge in India when the Chinese occupied Tibet, is now back upon his throne at Lhasa, and it seems likely that he will be supported, if necessary, by British troops in his efforts to assert the autonomy of Tibet against China. The chain of events leading up to this

situation is a curious one and worth recounting. In 1904 the British Government became alarmed at the growth of Russian influence over Tibet, particularly at the presence in Lhasa of Dorjieff, a Russian Buriat, who was presumably intriguing with the Dalai Lama. So General Younghusband was sent into Tibet with a military force which after some slight fighting succeeding in reaching Lhasa, the first Europeans, except a very few daring travelers, to invade the sacred precincts of the Forbidden City. The Dalai Lama fled into Mongolia, but with such authorities as could be found a treaty was concluded according to which Tibet agreed not to cede or lease any portion of her territory, not to admit the representatives of any foreign Power, not to grant mining or other concession or pledge her revenues without the consent of Great Britain. It was also stipulated that Tibet should pay $2,500,000 toward the expenses of the expedition which had amounted to nearly $10,000,000. But the home Government for some mysterious reason and very much to the disappointment of the promoters of the movement, refused to take full advantage of the treaty, and instead remitted two-thirds of the indemnity and withdrew the troops from the Chumbi Valley, the key to Tibet. The net result was, quite unexpectedly, that China gained more power over Tibet than she had had before, and is not now disposed to relinquish it. The Dalai Lama, after wandering with his caravan thru Mongolia and China, went back to Lhasa, but in 1910 was deposed by the Chinese authorities and fled across the border to Darjiling, where he was received with honors by the English. On the outbreak of revolution in China the Tibetans rose and overpowered the Chinese garrison in Lhasa. Last July the Dalai Lama returned to Lhasa. Dorjieff has also gone back to Lhasa, but probably Great Britain will not allow him to remain, for British rights are now expressly recognized by Russia, and a second expedition into Tibet would be easier than the first. The Anglo-Russian treaty of 1907 recognizes "the fact that Great Britain by reason of her geographical position has a special interest in the maintenance of the *status quo* in the external relations of Tibet."

Foreign Notes Several hundred Chinese bandits attacked a moving train at Fayuen, on the Canton-Hankow line, on August 27. Various persons were injured, and in the end the train was obliged to stop, the rails having been torn up. Many of the brigands roaming the countryside are discharged soldiers. Disorders are reported also from Hongkong, where armed marauders entered British territory on August 28.——An American representative of several Western bankers signed at Canton, on August 27, a preliminary agreement to lend $25,000,000 to finance a bank, railroad and mine in Kwanglung Province.——China has suppressed, thru the act of President Yuan, the oldest newspaper in the world, the *King Pao,* printed fifteen centuries ago (long before the inventing of printing in Europe), from lead and silver type, the newspaper itself consisting of ten leaves of yellow silk. The *King Pao* has appeared daily since 1800 and was suppressed in 1907 by the Dowager Empress for having revealed certain intrigues of the court in connection with the choice of the Crown Prince. But the newspaper soon made its reappearance under a slightly altered name —*Peking Pao,* or "Journal of Peking." ——Opium, for centuries the curse of China, has given way before the American cigaret, while in America the cigaret is leading to a more general use of opium, according to Prof. Albert Schneider, in charge of the United States Bureau of Chemistry at San Francisco. Professor Schneider asserts that the Tobacco Trust, after the campaign against opium, sent an army of men into China and distributed free more than $5,000,000 worth of cigarets. He says boys and girls in China, many barely able to walk without assistance, are confirmed cigaret users.——On August 26 was resumed, at Seoul, the trial of 123 Koreans charged with conspiring against the Japanese Government and the life of Count Terauchi, Governor-General of the province.

Hunting for the Capital of Australia

By Edwin E. Slosson

IF I had been asked before I went to Australia to give the name of the capital of that Commonwealth I should have been obliged to confess that I did not know it. So would anybody else. The capital of Australia is not only impossible to name, but it is hard to find. All roads lead to Rome. None leads to—what shall we call it? Perhaps *x*, since it is an unknown quantity. We can locate *x* by the co-ordinates, latitude 35° 15′ south, longitude 149° 15′ east from Greenwich. Or it may be alternately located, after the manner of real estate conveyances, by reference to certain blue gum trees—several hundred of them—on the site, and the Molonglo River flowing thru it. But doubtless the

reader will prefer the following directions: On a map of Australia draw a straight line connecting Melbourne and Sydney, divide it by two points into three equal parts, and the point nearest Sydney will stand for the future capital of Australia. This is more enlightening, because it shows not only where it is, but why it is there. Australia has only two cities of over half a million inhabitants: Melbourne, the capital of the State of Victoria, formerly the larger, and Sydney, the capital of the State of New South Wales, now forging ahead. When the Commonwealth was formed twelve years ago it might have been happy with either were the other dear charmer away. The pull of the two chief cities was strong enough to draw the capital down into the southeast quarter of the continent, but too strong to allow it to settle in either. By the law of the resolution of forces, which holds in politics as well as in physics, the federal capital, after a decade of vibration, came to rest between the two, but nearer to Sydney than to Melbourne. The Constitution of 1900 specified that the seat of government should be situated in New South Wales, but not less than 100 miles from Sydney, and that the federal parliament should sit at Melbourne until it met at the new capital.

Then came a ten-year controversy over the selection of the site. There were forty candidates. The first Royal Commission of 1899 decided in favor of Monaro. The second Royal Commission of 1903 gave the preference to Albury. The House of Representatives in 1903 passed a bill locating the capital at Tumut. The Senate amended the bill by substituting Bombala for Tumut. In

1908 the Government introduced a bill into the federal parliament to place the capital at Dalgety. The House of Representatives passed the bill, after putting Yass-Canberra in place of Dalgety, and this alteration was promptly accepted by the Senate and Administration. So it is in the Yass-Canberra district that the federal city is to be built—provided, of course, that the Government does not change its mind again.

There is, as I said, no road leading to the Australian Rome. There is, however, a road connecting Melbourne and Sydney which passes within some forty miles of it. On this road one thru train a day suffices for the passenger traffic between the two chief cities of Australia, cities the size respectively of Cleveland and St. Louis and 582 miles apart. I should say "a night" instead of "a day," because this "fast express" leaves Melbourne at 5 p. m. and reaches Sydney at 10 a. m., a disappointing arrangement for the tourist who wants to see the country and so would prefer a daylight train. It was also wrong of me to use the expression "thru train," because there are and can be no thru trains, owing to the fact the two States use different gages. The tracks of Victoria are 5 foot 3, and those of New South Wales 4 foot 8½. Each of the rival colonies planned its railroads to drain its territory to its own metropolitan seaport, and not until 1883 did they consent to meet at the boundary line, the River Murray. Here all passengers and goods had not only to be transshipt, but also at that time to pass thru the custom house, for Victoria was protection, while New South Wales was free trade. Now that the colonies have federated it is recognized as improper that interstate commerce should be impeded by disagreement as to railroad gages, and the military authorities are insistent upon the adoption of uniform gage as essential for defense. But it is one thing to recommend uniformity and another to secure conformity.

I was forcibly reminded that the

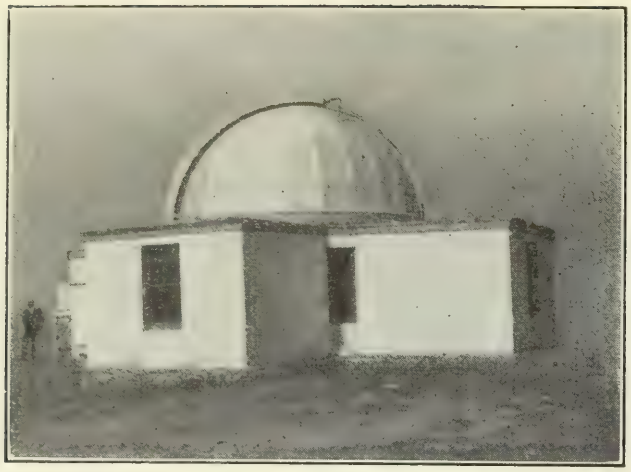
THE ROYAL MAIL
Crossing the federal territory from Yass to Queanbeyan

CHURCH AND SCHOOLHOUSE AT CANBERRA

nationalization movement had not yet affected Australian railroads when I was called along about midnight to get out at Albury. The fact that this is the boundary town did not seem to me a sufficient reason why I should walk the platform for an hour, at a time when I could not see it, nor did I perceive that the New South Wales cars were a sufficient improvement over the Victoria cars to make it worth while to change. All of the Australian railroads stick to the English custom of first-class and second-class compartments, like a string of stage coaches fastened together, as indeed they originally were, but there is a corridor run alongside, so the traveler has more freedom of movement than on the ordinary European cars. The trains are vestibuled and provided with dining and sleeping coaches. When it comes to sleeping, the compartment system has its advantages, particularly for couples and parties of four, since they can have an apartment by themselves, with toilet accommodations, much like a ship's cabin or a Pullman stateroom, except that one travels transversely instead of feet foremost. Another improvement on our customs, almost as great as the relief of the congestion of the common dressing room, is the assignment in advance of seats in the dining car to those who order meals, so that each passenger knows when to go and is not obliged to stand in line or take his chance. The Australians have so far cast aside British prejudice as to adopt our checking system. This is a great convenience, for baggage so checked goes without charge on the same train, whereas if one sends it by the so-called "rapid despatch," it takes eight days to get from Melbourne to Sydney, as I know by unhappy experience.

Collectivism is the dominant tendency of Australians, but they are individualistic when it comes to car heating. Instead of keeping the temperature comfortable for all by means of steam pipes, they expect every passenger to carry a rug and keep himself warm by the internal oxidation of carbohydrates. It was June, and my heavy, fuzzy steamer rug was needed to keep my legs warm during the chilly and cheerless hours of that winter night between the hours of 11.52 and 5.17 a. m. A sleeper was impossible; so was sleep. The sleeper section of the train had gone on thru to Sydney without stopping at way stations, and I could not stretch myself out on the long seats, after the custom of the country, because the compartment was too crowded. We all had to sit up straight and proper, and talk or listen. Listening to the two men in the inside corners talking politics, I gathered that the Commonwealth was being driven to the verge of ruin by the extravagance and tyranny of the Labor Government. This was alarming, and I was relieved to find that these men were equally positive in their assurance that the catastrophe would be averted by the overthrow of the Labor party in the near future. Then there was on board a Sydney real estate man; there always is on every train and steamer, and mighty good company they are, too, being of the optimistic temperament characteristic of the profession the world over.

The other passengers in the compartment were a tall and taciturn Tasmanian and his more talkative daughter, as rosy-cheeked as the apples for which Tasmania is famous. It was her first glimpse of the great outside world, this trip to Melbourne and Sydney, and she was making the most of it. Her autograph album, purchased for the purpose, was presented to every passenger, and she was particularly delighted to secure the signature of a man so remote from Tasmania as Manhattan Island. I fear it will be many years before my autograph attains so high a value again.



At several stations along the route we heard a merry din and were showered by paper confetti as the train was invaded by wedding parties which had sat up to see a happy couple off on "the grand tour" to Sydney and return. The bride, leaning out of the window, distributed kisses with generous impartiality as the whistle blew and the bell rang, and then the train pulled out while a duet of adieus was answered by a chorus of farewells, dying away in the distance.

I was not able to take advantage of such snatches of sleep as the distractions and posture allowed me, because I had to keep a watch at the window for Yass Junction, which, not being a conspicuous place, might easily be missed in the dark. But I did not miss it, and stumbled out upon the platform as the train drew up by a bit of a station office. On the other side was a wheezy little engine with a sort of seated box car attached. Even here class lines were drawn, tho the distinction was purely nominal, for there was only one compartment and the seats were equally hard. But as I had a first-class ticket, at tuppence extra, I took my seat in the section so marked and enjoyed my tuppenyworth of state, so far as that was possible in the absence of any second-class passengers to envy me. I could indeed regard it as a special train run for my own convenience, since I was the sole occupant. Nobody else seemed to be going to the capital.

Three miles they say it is from Yass

THE OBSERVATORY ON MOUNT STROMLO
The Greenwich of Australia

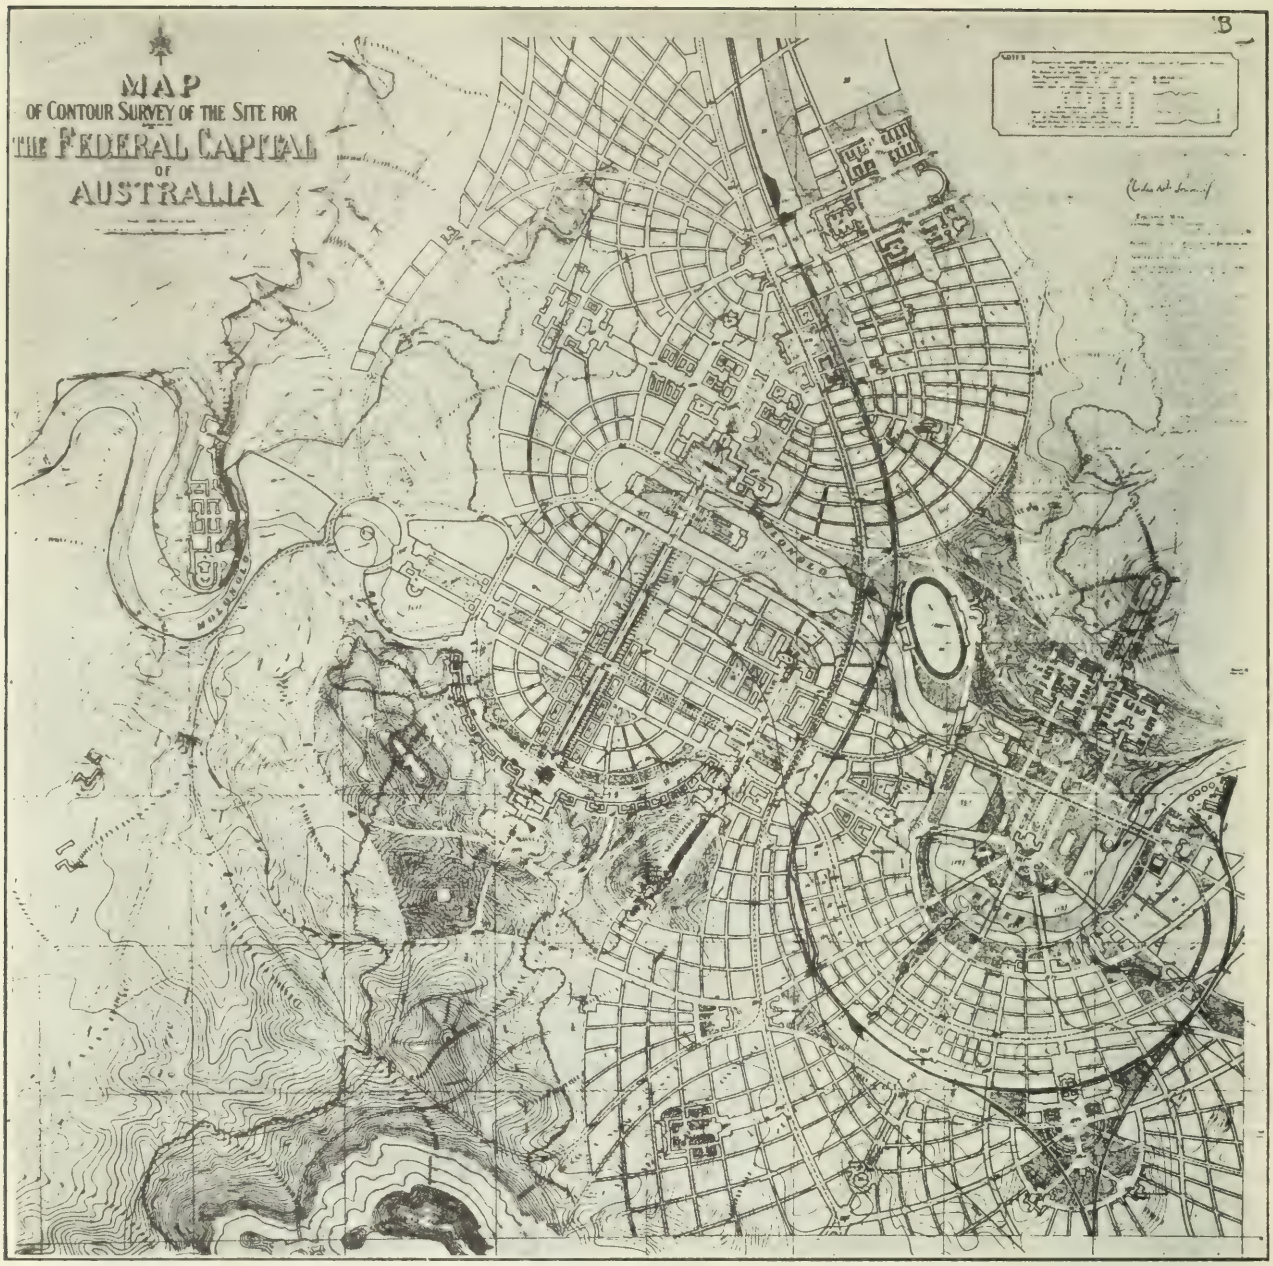
Junction to Yass town. It seemed longer, but at last the train came to a stop. So far the rails ran; the rest of my pilgrimage must be accomplished by the more primitive method of a stage coach which twice a week leaves Yass at 7 o'clock in the morning for Queanbeyan, forty miles away. At Yass there was not even a station agent to relieve the loneliness of the stranger dumped down upon the outskirts of the country town. The only live thing visible in the darkness was a man picking up the mail bags, who kindly permitted me to follow him. His kindness went further, for after safely depositing his bags inside the postoffice door, he offered to take me to the Royal Hotel. Ordinarily I would have demurred, for, traveling in the British dominions, I have learned that the taste of the royal family in the choice of theaters, restaurants and hotels is not the same as mine; in fact, that any public resort which claims His Majesty, Her Majesty or the Prince of Wales as its patron is to be avoided by those who care for comfort and cleanliness. But under the circumstances I could not afford to indulge my democratic tastes or prejudices, so I followed close to my guide as he led me into a dark and silent house and upstairs and along narrow winding passages by a series of flashlight dashes that used up the greater part of a box of matches. Finally he thrust me into a little writing room behind the dining room and bade me good night. I groped around until I found a lounge upon which I stretched myself with hardly enough wakefulness to roll up my overcoat for a pillow and draw the steamer rug over me.

The first thing I knew it was broad daylight and there was a rattle of wheels at the door. I looked out of the window and there was the stage coach just starting. So I grabbed my overcoat and rug with one hand and my satchel with the other and made a dash for it, quite frightening the dining-room girl, who, not knowing that a stowaway was harbored in the writing room, had failed to call me to breakfast.

But a missed meal is of no consequence. Before we had gone many miles we stopped to leave mail at a crossroads store, and I laid in a supply of what we call crackers and candy, but in the Australian tongue are known as "biscuits and lollies." With this solace I could enjoy the scenery, at first a bare and gently rolling country, like the Kansas prairies as one approaches the hundredth meridian, which marks the dividing line between fertile and semi-arid land. Later the country grew more hilly and wooded, like Central New York, tho without its greenness. For this is a drought year. "Never knew it so dry," said the oldest inhabitant to me. But I was not surprised. It is always my luck. I never visited a place yet but that the climate had just undergone a complete change. All weathers at my appearance run to extremes, becoming the wettest or driest, hottest or coldest. Others have told me that they have had the same experience. And not only weather, but horses, automobiles and children are affected similarly and behave in an unprecedented manner in the presence of a stranger.

Certainly there was no question about the drought. The dust lay deep in the road and rose and wrapt us as with a dry fog. The fields were eaten bare of pasturage. The sheep, under the stress of privation, had lost their gregarious instincts and scattered widely, every one for himself, digging their teeth deep into the grass roots. Sometimes the road was crowded with a flock of sheep being driven unfattened to market, to be sold for a song or a sixpence. My informants differed as to the market price expected, so I give both quotations. The

mulga trees, which grow like willows along the banks of the creeks, are being stripped of their branches to supply fodder to the starving cattle.



The most thriving or at least the most numerous live stock of this region is the rabbit. The struggle for life in the animal kingdom is controlled by something similar to Gresham's law in the financial world, that poor money will drive good money out of circulation. Sheep will undereat cattle and so drive them out of the country, but rabbits in turn will undereat and displace the sheep. The lower the standard of life the fitter to survive in times of common privation. As we drive along the dusty roads of the federal domain, cottontail rabbits by dozens jump up from invisible lairs and radiate in all directions like a covey of quails.

We see on all sides as we drive along evidences of the perpetual warfare against the pest. The fences of many of

THE FIRST PRIZE DESIGN

By Walter Burley Griffin, of Chicago. In order to secure concentration of like interests and ease of communication Mr. Griffin has devised a system of polygonal groups connected by a few thorofares for traffic and business. The Government buildings are grouped in a triangle, the apex of which is Capitol Hill and the base rests on the river, here converted into a crescent-shaped basin with round ponds at each end. The thorofare on the right of the triangle crosses the river to the market and mercantile center. The thorofare on the left crosses the river to the municipal center, to the left of which lies the university and beyond it the manufacturing suburb. On the left of the Capitol is the residential suburb and on the right the agricultural suburb. A birdseye view of the city as seen from Mount Ainslie looking across the river to Capitol Hill is given at the head of this article.

THE SECOND PRIZE DESIGN

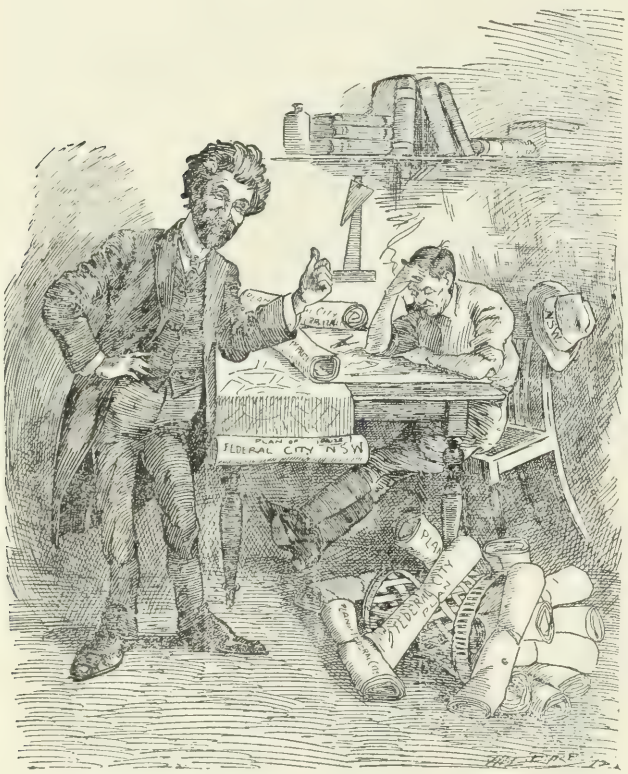
By Eliel Saarinen, of Helsingfors, Finland. The most striking peculiarity of this design is that most of the streets are curved yet sharp angles and "flat-iron" lots are avoided with great skill.

the fields are made rabbit proof by a wire netting extending from six inches below the ground to two feet six inches above. Of course the rabbits can jump higher than that, but they think they cannot, which amounts to the same thing. But at a corner the net has to be higher, because when the rabbits find themselves caught in the angle between two fences they get frightened and so gain courage to jump higher. The gates to the protected fields are also rabbit proof and bear a signboard threatening with a fine of one hundred pounds the man who leaves one open. We meet a buggy, which a boy hunter is driving to town, half hidden by the rabbit skins hung overhead and under the box and all around. He gets eighteen cents a pound at Yass for the skins, and may profitably devote his whole time to the business, for he can make the rounds of a hundred traps in a day.

The stage coach of which I am the sole passenger is the Royal Mail, and its advent is awaited with eagerness, tho country people here, as everywhere, conceal that emotion under a mask of apathy. The caryatides supporting the columns of the porch of the country store scarcely stir as the coach they have awaited pulls up in front of them. Somebody is

watching for us at almost every corner and lane end. A slip of a girl in a slip of blue calico dodges out from the shade of a big black stump and silently holds up a tin pail. Two small boys on a barebacked horse wait beside the road and gallop off as the driver shakes his head. A few minutes later the stage stops and stands still so long in the road that I wonder if the driver or the horses have gone to sleep, but then I see a frantic female running across a field with a few pennies clutched in the hand she is waving in the air. The driver is no soulless official. He takes a personal interest in the public he serves, making inquiries as to the health of the patient when he passes out the medicine ordered by telephone from town, and hailing a girl absorbed in her play by: "'Ere's your mother's 'at, Liz!" From the immensity of the square pasteboard box thus consigned I gather that the mother of Elizabeth is well up in the fashions. The tin signs nailed on the porch posts of the crossroads stores show that the Government has here established, not only a letter and parcels post, but also a savings bank and telephone and telegraph facilities; a penny in the slot for the telephone and 12 cents for telegrams of 16 words within 15 miles or 24 cents to any part of the Commonwealth. Parcels must not exceed 5 kilograms (11 pounds) in weight or 3 ft. 6 in. in length, and the rate is 12 cents for the first pound and 6 cents for every additional pound inside the State.

I naturally expected to find the people highly elated over the selection of their country as the best place in Australia for the federal capital and wildly enthusiastic over its prospects. But quite the contrary. I have seen a thousand times more excitement over the location of a Kansas courthouse. The prevalent spirit of the community is pessimism, spiced with contempt and cooled with indifference.



"When will the city be built?" I asked of a man who was well informed, or at least ready with information. "Whenever the Barren Jack weir holds water," he answered promptly. I had heard this phrase often enough during the few weeks I had spent in Australia to know what it meant. It had the same significance as "When the sleeper wakes" in Wells's story. It is a date in the Greek kalends. The reference is to the great irrigation scheme which the New South Wales Government is carrying out to impound the waters of the Murrumbidgee River, and so to bring under cultivation over half a million acres of land in the vicinity of the federal domain. The project is an ambitious and expensive one, but has been pronounced practical by Elwood Mead, the irrigation expert of Victoria, and there appears to be no justification for the local skepticism.

I inquired of one of the oldest settlers in the district what sort of land had been picked out for the capital, hoping that here at least I should strike out a spark of local pride. I did, but not of the sort I expected. "Beautiful site," he said. "Fine rolling land. Seems a pity to spoil it by dumping down a lot of buildings on it."

One reason why the people living in the country now set aside as federal territory are lacking in enthusiasm over its prospects is because there is little chance of their profiting by it. Australian legislation in recent years has been directed toward preventing individuals from getting hold of the "unearned increment," to use Henry George's phrase, altho it is not altogether appropriate considering how hard people will work for it. Where such legislation has accomplished its purpose it has been mostly because the increment has failed to materialize. At any rate, land booming on the federal territory is prevented by the provision in the Seat of Government Act that the Commonwealth should have the right to buy any private lands in the ceded area at the value it had in 1908. About a third of the federal territory was in the hands of individuals at the time of its cession by New South Wales—and they, of course, cannot sell out at an advance, no matter how long the city may be a-building. The Commonwealth Government has determined not to alienate any of its land, either in the city or in the surrounding country. It will be leased instead of sold, and the Government expects to realize from its rentals $150,000 annually in the earlier years, augmenting as the city grows.

The territory ceded by the State of

New South Wales to the Federal Government comprises about 900 square miles. It is, therefore, about thirteen times the size of our District of Columbia. It is irregular in outline, shaped somewhat like the "swag," or pack, borne on the back of an Australian when he tramps the country in search of work or other means of support. The object of this form was to secure the valley of the Murrumbidgee River and the entire catchment area of the Cotter River, which is to be kept free from population in order to provide a supply of uncontaminated water to the future city. The Cotter catchment embraces 170 square miles, and is calculated to furnish water enough, at the rate of 100 gallons a day per capita, for a city of 200,000, which is about what the population of the federal city will be in a hundred years if it grows at the rate of Washington. If the city becomes larger than that additional water may be obtained from the mountains lying outside the territory, which reach an elevation of five to seven thousand feet, the highest of the Australian continent. The elevation of the federal territory ranges from 2,000 to 2,900 above the sea, and being on the inner side of the Dividing Range it is shut off from the coastal rains. The temperature of the three hottest months is 67° F., and of the three coldest 42°. Frosts are slight and snow is rare. The average rainfall is 22 inches, tho in some years it is twice that or half that. On the whole the climate most closely resembles that of San Francisco, in spite of the fact that the one is on the sea and the other in the highlands.

KING O'MALLEY: "I hope those plans will keep that rooster quiet, for we are not leaving Melbourne for quite a while."

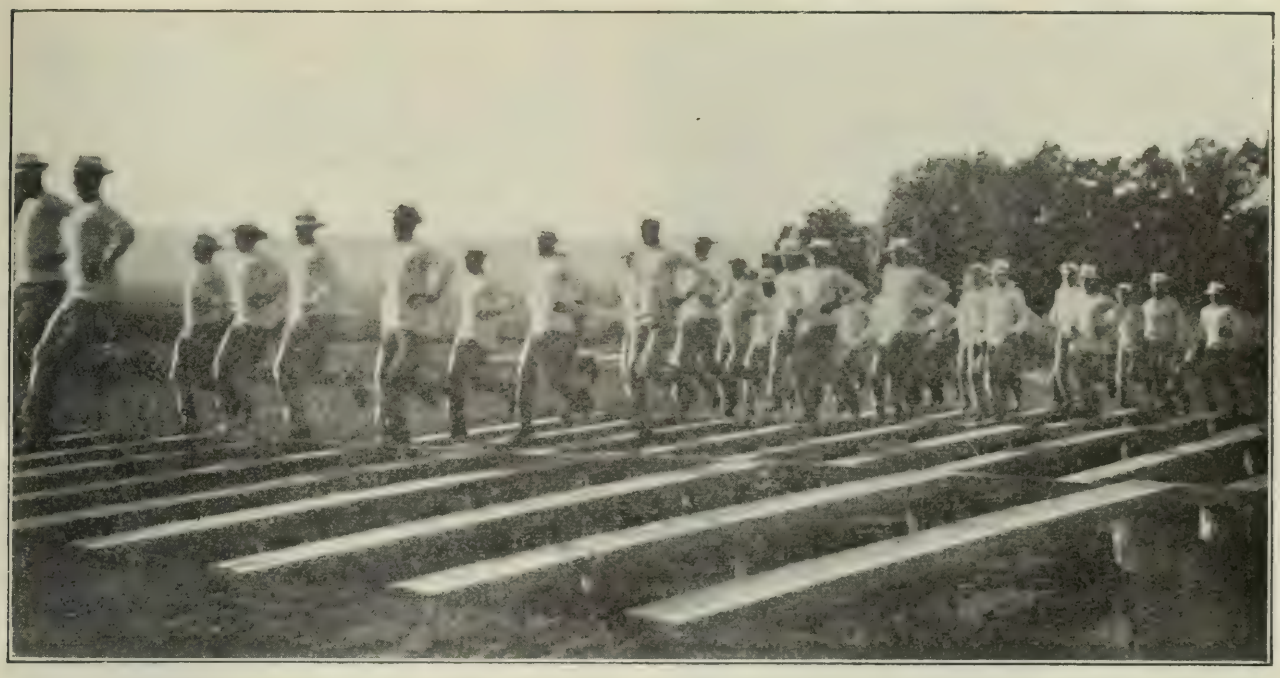
[The cartoonist of the Sydney *Daily Telegraph* intimates that the Minister for Home Affairs is using the design competition to prevent New South Wales from fretting over the delay in the removal of the Government to that State. As text of the cartoon the following lines are quoted from an interview with Mr. O'Malley: "'You see,' he went on, emphasizing his remarks by beating two fingers upon the palm of his hand, 'this federal city will not be built in a year, nor five years, nor fifty years, nor, perhaps, five thousand years.'"]

Altho we may anticipate that the water supply will be adequate to the urban population, still the dryness of the federal territory is undeniably a disadvantage. Some market gardening may be maintained in the vicinity of the capital by irrigation, but for the most part it is "sheep country" with all that this term implies. The soil is light and sandy. The erratic rain carves it into gullies and washes it down stream with floods. To preserve it and to make the environs of the city attractive a carefully planned system of afforestation will have to be carried out. At present it is a desolate looking spot, tho allowance must be made for the fact that I saw it in a season of exceptional drought. The grass was scanty and withered; the creeks ran low in their sunken beds; the native trees had been in many cases ring-barked and left to die, raising their bare, distorted limbs despairingly toward the clear blue sky. The eucalyptus is not a cheerful tree even at its best and it does not die gracefully. But the general view of the territory from the observatory on Mount Stromlo is very beautiful, the gently rolling plain of Canberra, thru which the streams wind sluggishly, the wooded ridges between and on the horizon round about high isolated hills and a glimpse of blue mountains, sometimes snow-capped, in the distance. There are no buildings in sight except those of two or three "stations," ranches we should call them in the West, and the old Canberra church, with a funny little schoolhouse

THE THIRD PRIZE DESIGN

By De Alfred Agache, of Paris, professor in the Free College of Social Science. This provides for a more compact city than the others. The residences and business houses are in rectangular blocks fitted snugly about the public buildings and surrounded by parks, gardens and railroad yards.

close by. On the slope of what may be called in anticipation Capitol Hill are the tents of the surveyors, first inhabitants of the future city, laying out the land for those who are to follow.



In one of these tents I was able, thru the favor of the Federal Minister for Home Affairs, to secure a cot; otherwise I should have been obliged to have spent the night in the open, for hotels have not yet made their appearance in the Australian capital. The air was cool after sundown, and sleep was quick to follow upon the all-day ride and the rugged night before that. But my dreams were strange; motion pictures of cities full of men; fantastic architecture dissolving into the twisted trunks of eucalypts; a medley of all styles known to me and many unknown to anybody; beautiful or grotesque, Oriental, Occidental, aboriginal motifs treated *à l'art nouveau,* Rodinesque monstrosities, Teutonic monoliths, the Pergamon reliefs with the kangaroo and emu fighting for a crown and a blackfellow in the coils of an octopus. But always when I had got a city constructed to my taste, in that semi-impersonal fashion peculiar to dreams, there came a burst of satiric laughter or a harsh "Ah! Ah!"—the very intonation of the ironical "Hear! Hear!" of the British hustings—and at this outburst of skep-

ticism the vision vanished, leaving but a barren plain filled with scampering cottontails. Once more I reconstructed the city in my imagination, but this time it was destroyed by an earthquake and a conflagration, both of unusual severity and persistence. I tried to get rid of them and go on with my pleasant task of city planning, but I could not, for the earthquake resolved itself into the camp cook shaking my cot and the conflagration into the rays of the rising sun shot into my eyes from between the tent flaps. Only the chorus of sarcasm and laughter remained real, and that was louder than ever. I stuck out my head and discovered the cause; it came in this case from feathered bipeds, a flock of crows in the trees overhead and a big-headed, long-beaked bird called by the Australians the jackass, so named doubtless because it laughs at everything.

To an American it seems strange that the movement for a federal capital has to overcome so much indifference and opposition. If Australia is to learn to think nationally the Commonwealth Government must have "a local habitation and a name." The latter, almost as important as the former, is not yet decided upon. They had better be about it, otherwise the ridiculous hyphenated form "Yass-Canberra" will be perpetuated. "Yass" alone is short and uneuphonious; sounds like a colloquial affirmative. Besides Yass is not on the federal domain and has no more right to give its name to the capital than Queanbeyan on the other side of it. "Canberra" (local pronunciation accents the first syllable) is not so bad. It has at any rate the right of priority and possession. Its derivation is unknown. From the spelling one would suppose it to be an aboriginal name such as are common in Australia, but one of the surveyors showed me a tax description of 1831 in which it is spelled "Canberry," so it may be of British origin, tho I do not know of any such place in England. Australia has had no George Washington in its uneventful history, no man who could be called "first in war" or "first in peace," because it is the one continent which has never known war. There have been energetic governors like Macquarie and courageous pioneers like Flinders, but no one of such pre-eminence as to claim unchallenged the right to give a name to the national capital. Australia must have had its Columbus, but nobody knows his name now or even his nationality.

But whatever name may be chosen it will gradually acquire its own significance and serve as the point of crystallization for national sentiment. At present Australia is united only on paper. The federal Government is regarded by many, especially its political opponents, as a sort of fifth wheel to the coach, as an expensive and inconvenient superfluity. The members of parliament and permanent officials dislike the idea of leaving Melbourne to live in the bush. The Melbourne people naturally are not in a hurry to hasten the departure even tho in the meantime they have to give up their State House to the federal Government. The Sydney people are not without hopes of getting it yet. Many a time I have been told that it was impossible to create a city in such an artificial, premeditated way. Naturally I listened to such Topsy-talk with considerable internal amusement, for I had in mind certain thriving cities of Kansas and Nebraska which I knew as a boy when they were as bare as Canberra plain and did not possess half as large a rabbit population. More to the point as examples of cities artificially hatched are La Plata in Argentina and Dalny, or Tairen as the Japanese call it, in Manchuria.

When Washington was founded the United States had about the same population that Australia has now, and more widely scattered if we use time of travel as the measure of distance. All manner of fun was made of its backwoods location and its pretentious plan. But now its "magnificent distances" are seen to be none too large and we Americans have come to do honor to the French engineer L'Enfant, who drew the plans for the city and to the statesmen who carried out the project. Washington has in spite of its unfortunate climate become a favorite place of residence for those who can afford to live where they please. It is an intellectual as well as a political center. The American Association for the Advancement of Science, when it meets at Washington, has a larger local attendance than at any other city.

CADETS OF THE MILITARY COLLEGE TAKING THEIR EARLY MORNING EXERCISE

There is no reason why the federal capital of Australia should not have as bright a future as Washington, and its builders be as highly honored. The present federal Government, the Labor Ministry of Andrew Fisher, deserve great credit for the energy shown in pushing the project and the carefulness with which the details are thought out in advance. It is not necessary to assume with their opponents that the motive of the Government is the desire to give employment to a large number of workingmen at a cost to the country of $10,000,000 or indefinitely more. There are sufficient reasons without taking that into consideration. Chief among them is the immediate necessity of putting the Federal Government in a dominant and independent position and that can only be accomplished by placing it on territory of its own, a clean site, free from the factional fights and the prejudices of past politics. The American States would never have become truly United if Congress had continued to meet in Philadelphia.

Fortunately the Minister for Home Affairs—Secretary of the Interior, we should call him—is a man who is not deterred by opposition and not at all afraid of ridicule. He does not mind in the least being laughed at because he usually gets his chance to laugh last. He delights in shocking people by his irreverent disregard of the conventionalities and precedents so dear to the British mind, and they awake from the shock to find he has accomplished his purpose. O'Malley is his name, King O'Malley he christened himself at an early age, because, as he says, it sounded well. Possibly he had in mind even then the day when he would be in his present position drawing up proclamations ending with the words:

By His Excellency's Command.
KING O'MALLEY.
GOD SAVE THE KING!

He confided to me as he does to every one that he had only missed being President of the United States by being born thirty feet on the Canadian side of the line. He rectified this initial blunder as far as possible by emigrating to the United States when he was two years old. In America he pursued an adventurous career as promoter of various enterprises, financial, real estate and religious, or all three in combination. Elected as member of Parliament from Tasmania, in 1910, he entered the second Fisher Ministry, where he has charge of the construction of a transcontinental railroad as well as of a federal capital. To complete the picture of this interesting personality it is necessary to add that Mr. O'Malley is tall and has a long blond beard, turbulent hair, a twinkle in his eye and arms

WALTER BURLEY GRIFFIN
The young Chicago landscape architect who won the international competition for a plan for the federal capital of Australia

like a windmill, used in much the same way when he talks. And he talks with an apparent recklessness that effectually disguises the fact that he is really not giving himself away. Minister O'Malley is not easily bluffed. It is a game he can play himself.

The reader may imagine the feeling aroused in Australia when it was learned that this job of city designing was not to be given to local talent, but to be thrown open to the world—the world, mind you—with the chance, or more than a chance, that the lucky envelope when unsealed might be found to contain the name of some foreigner, perhaps even a German. As it happened, the second prize was awarded to a design having all the earmarks of Teutonic taste, and nobody would have guessed that it was really drawn by a Finn. Considering the fact that the political weather map now indicates an area of such low temperature and high pressure in the North Sea, it shows great liberality and fairmindedness on the part of the Government to have thus run the risk of having the capital of the Commonwealth branded with the offensive trademark "Made in Germany."

Nor was Mr. O'Malley fazed when the architectural institutes of both Great Britain and the United States officially boycotted the competition on the absurd ground that the final selection of the designs was in the hands of politicians. Just as if this were not a city of politicians, by politicians and for politicians! But that is just like architects; they are never willing to let the people who are to live in a house have anything to say about it. Fortunately, the opposition of the organized architects did not interfere with the success of the competition. The big ballroom of the Governor-General's palace in Melbourne was crowded with designs from all parts of the world, about two hundred in all; some hasty sketches, some mere freaks, but most of them well worked out and showing great ingenuity in adapting the specifications to the lay of the land. One man had prepared a plaster model of his acropolis. Another had sketched on the big sheet with pen and ink every house in the city. The labor expended on some of the plans must have been more than would have been repaid if they had taken one of the premiums, of which there were three; $8,750 for the first, $3,550 for the second and $2,500 for the third.

A committee of experts consisting of an engineer, an architect and a licensed surveyor was appointed and spent several months in studying the designs in detail. Two of them agreed on the three winners, and their report was adopted by the Government. The third member, the surveyor, picked out three different designs, none of which had been thought worthy even of honorable mention by the majority of the committee. Of the designs preferred by this minority member, two turned out to be by Australians. All three of the winning plans are of superior workmanship and show careful attention to details of construction. All three solve

the problems of adaptation of the specifications to the lay of the land in a fashion surprisingly similar, and it may therefore be possible to adopt certain features of each without destroying the harmony of the whole.

The winner of the first prize is an American, Walter Burley Griffin of Chicago, and his design bears a certain superficial resemblance to the map of Washington. It is, however, radically different, attaining the same end, a combination of vistas and convenience, by an ingenious system of octagons and hexagons instead of the diagonal network superimposed upon the conventional gridiron as in Washington. This makes possible square blocks and straight streets for the most part, yet avoids monotony and conforms closely to the contours of the site. The parliamentary buildings are grouped on a triangle with its apex on the hilltop and its base on the Molonglo River, in which they will be reflected as in a crescent mirror edged by public gardens.

One of the strongest points of the American design is that the city can be begun on a small scale at small expense, and later expanded as desired far beyond the twelve square miles allotted to it and yet maintain its symmetry at all stages of its growth. Mr. Griffin has also worked out the engineering details of his plan with greater thoroness than his competitors, so there can be no question of its practicality and beauty. His subsidiary designs are on a large scale, one thirty feet long, another eight feet and two others six feet long.

The second prize was awarded Eliel Saarinen of Helsingfors, Finland, for a design obviously German in style, extremely formal but not conventional. Architecture is showing more vitality in Germanic countries than elsewhere nowadays. Even the Kaiser cannot altogether repress it. Some of the modern buildings and monuments show a surprising originality in the handling of large masses and surfaces in an effective manner. This characteristic is manifest in Mr. Saarinen's perspective of the public buildings, while in his domestic architecture he has shown a better appreciation of the climatic advantages than the Australians themselves, for his general view shows a city of Oriental aspect with habitable housetops. The Australians, however, tho fond of fresh air make little use of their roofs. In this as in many other things the Australians prefer English precedent to their own comfort and often top their houses with steep snowsheds even in regions where snow never comes and rain but rarely. But while this second prize design has some noteworthy suggestions it is as a whole unsuitable. Almost every street is curved; the railroad cuts thru the center of the town; and a stream of such freaky disposition as the Molonglo would never consent to be cribbed, cabined and confined in such a series of narrow geometrical lagoons.

The third prize went to a Frenchman, Dr. Alfred Agache, and it is worth noting as one of the rare instances of practical utility of an international language that he was attracted to the competition by a notice sent to one of the Esperanto magazines by an official of the Home Affairs Department. As soon as he was notified of his success Dr. Agache cabled his thanks to the *Melbourne Esperantist.* There could have been no doubt as to the nationality of this design even if its descriptive matter had not been in French. In conception and draughtmanship it bears the Beaux Arts brand, which is to say that it is both attractive in form and accurate in technique. It also shows its French origin from the fact that the artist has made an aviation field a conspicuous feature of his design and provided a detailed working plan of it with hangars, aeroplanes and dirigibles drawn to scale.

The design placed first by the minority member of the committee was the work of three Sydney architects, Messrs. Griffith, Coulton and Caswell. It has some interesting features which may well be taken into consideration, but as a whole it is lacking in the grandeur and distinction of the prize designs and curiously enough is defective on the very point where it would be expected to excel, that is, adaptation to the ground. The two halves of the city are connected by a single bridge of 1,200 foot span over the river, which is kept at the full width of its highest flood. This puts an artificial lake of 1,000 acres right in the heart of the city, or rather mud flats of that extent, admirably adapted to the breeding

of mosquitoes, but possessing no other apparent advantage. Many of the competitors, including the American, seem to have been misled by the maps and specifications sent out by the Government into giving exaggerated importance to the Molonglo River, which, when I saw it, was a muddy little creek easily wadable by a barefoot boy. The less that is made of it the better, and inside the city the channel should be no wider than is necessary for carrying off such surplus waters of the flood season as cannot be held in upstream reservoirs.

The minority member gave his second award to Arthur C. Comey, of Cambridge, Mass., and the majority gave honorable mention to Harold Van Buren Magonible, of New York. Out of eight names mentioned in the report of the committee three are Americans, a very good showing indeed for our city designers.

The next competition, for the Houses of Parliament, a building about 600 feet by 200, will be almost as important as that for the city plan, because it will determine the style of architecture to be generally adopted. Then will be erected, in the most convenient sequence, offices of the eight departments of the Administration, residences for the Prime Minister and Governor-General, post office, mint, court houses, Government factories, printing office, university and technical college, and the national theater, art gallery, museum and library.

The first Government buildings erected on the federal territory are those of the military college, established last year as part of the new scheme of national defense. This is to be an institution similar to our West Point, and the first batch of thirty-three cadets from all parts of Australia are already in residence under the instruction of officers from the British army. The large stone buildings of the Duntroon homestead serve for housing the administrative staff, and temporary wooden barracks and classrooms have been put up for the cadets. I drove over to college from the camp as soon as I got up and had a bite of breakfast, but early as it was, the cadets were already at work on the parade ground, some going thru squad drills, some the setting up exercises, others climbing high board fences. As I was shown thru the lecture room of the class in strategy I was shocked to see upon the blackboard a plan of campaign for the capture of Washington. The commandant, however, explained that the class was merely studying one of the campaigns of our Civil War. This relieved my feelings, for I had begun to fear lest the British were preparing to repeat their feat of 1814, when they burned the Capitol at Washington and made the Executive Mansion turn pale.

To provide against such a calamity the federal capital of Australia is not placed upon the coast, as was at first proposed, but a hundred miles inland, and the railroad which will connect the capital with Jervis Bay, the federal seaport, passes thru a mountainous territory which would be easy to defend against any invader. But let us hope that the new capital will have better fortune than our own and never be destroyed by a foreign foe.

If the plans adopted are carried out, it should be a far more beautiful city than Washington, for in the century that has elapsed city planning has become a science. The world competition has justified itself in that it has caught the attention and engaged the services of a young American who, it seems to me, possesses a spirit akin to that of the Australian, that peculiar combination of courage and originality with practical common sense which characterizes the political expedients of the island continent. Mr. Griffin's description of his ideal city, which he submitted with his plans, should be published, for it is interesting even to a layman. It thrills one in the reading like the Declaration of Independence. Such in a sense it is, a declaration of independence against oppressive conventionality and hampering traditions of the past. Let me quote, for example, the passages in which he gives a hint of his idea of the architectural style and material of the city. The two essentials are, he says:

"First: Largeness in the unit buildings, which modern fireproof construction renders at the same time the most convenient, and the cheapest, as well as the most monumental shelter for our operations. With a liberality in public space, and judicious distribution of centers, and directness and speed in commun-

ication between all points, the necessity of making these large units stand on end, as in the congested American cities, can be avoided in a capital city at least, securing a horizontal distribution of the large masses for more and better air, sunlight, verdure and beauty.

"For the second essential, uniformity in style, it is hardly advisable to recommend, however, an adaptation of any historical style which different requirements will inevitably render a caricature instead of a reminiscence of its own proper grandeur. Thus are Greek temples rendered boxes with glass windows instead of masses of masonry, and colonnades are applied in front of windowed walls to the detriment of light and comfort, and thus are noble features like columns, capitals and consoles mutilated and distorted, distributed for every sort of function except their inherent one of support. That sort of treatment may be well enough in scene painting and even exposition buildings, but can by no means be considered dignified, as permanently standing for the life and government of a great modern commonwealth.

"It would seem that a suggested restriction to one material, say, reinforced concrete, the newest, cheapest, most durable, least limited, most plastic and variable single medium yet introduced into construction would contribute to the dignity and impressiveness of the entire city, while purity in proportion and unity in scale, appropriate immensity in spans and masses with contrasting delicacy in plastic ornamentation, the elimination of useless protective features and connective expedients, uncalled-for in monolithic construction, together with a maximum of repetition and rhythm, and a general simplicity which is best adapted to the economical handling of this medium, would with imagination suffice for a national and genuine style."

This advice is better, perhaps, than Mr. Griffin himself realizes, for concrete construction is peculiarly adapted to Australian climate and conditions, tho, strange to say, but little used there yet. The white ants which abound on the capital site are destructive to all woodwork. Stone and brick building is expensive on account of the high price and slow motions of skilled labor. But work in concrete may be carried on cheaply and rapidly even where highest wages and shortest hours prevail.

The honor of having produced the winner in this world-wide competition goes to the University of Illinois, which, as the readers of THE INDEPENDENT know, possesses one of the most enterprising architectural schools in the West. Walter Burley Griffin was graduated from that school thirteen years ago, and locating in Chicago devoted himself chiefly to landscape architecture, rising in the profession by his own exertions without the aid of social and business connections. In gardens his most important commissions have been the grounds of educational institutions, notably the Northern Illinois and Eastern Illinois State Normal Schools and some subdivisions and village planning, including Idalia, Fla., in the process of construction. Previous to the Canberra theme, the only large city plan he has worked out was for a proposed redistribution of the city of Shanghai, China, which came to naught thru the death of the delegate promoting it.

But city planning has been a hobby of his ever since his school days, when he read everything in English and French that he could lay his hands upon. He watched with keen interest the development of the project for a federal capital in Australia ever since the incorporation of the proposition into the Commonwealth constitution. When finally the competition was decided upon and the data obtained he gave himself two months to becoming familiar with the topography and the scenic conditions in order to become pretty thoroly at home in the region before essaying a *parti*.

Mr. Griffin's wide views and constructive genius are manifest in many parts of the specifications for his ideal city. For example, his plan for the arrangement of the federal buildings is based upon a theory of the relation of the powers of government, which he presents diagrammatically. The grouping of the university buildings in the capital city represents topographically his system of classification of the sciences, as ingenious as Comte's.

It is a great enterprise on which Australia has embarked, the construction of a city worthy to stand at the head of the Commonwealth, and America may take pride in being able to contribute thru Mr. Griffin to its realization and success.

NEW YORK CITY.

America and World Peace

BY ABDUL BAHA ABBAS

[Abdul Baha Abbas, Persian prophet and teacher, courteously replied to the questions of a representative of THE INDEPENDENT by means of an interpreter. In spite of the lofty position ascribed to him by his followers, his interest in ordinary human affairs is keen. He was dressed in flowing robes and turban, which accorded well with his square cut gray beard. His blue eyes are frank, lively and humorous, his figure of medium hight and slight, but erect and graceful in spite of his sixty-eight years. When he was in London he preached in the City Temple and in St. John's, Westminster, and in the United States he has been invited to the pulpits of various denominations. In our issues of April 11 and July 18 some account has been given of the leader of the Bahaists.—EDITOR.]

I AM very pleased with America and its people. I find religion, high ideals, broad sympathy with humanity, benevolence and kindness widespread here, and my hope is that America will lead in the movement for universal peace.

The people of this land enjoy many blessings. Day by day they are advancing and progressing, their fortunes are in their own hands, their patriotism is strong, they enjoy freedom in a superlative degree. They are not restrained by ignorance or the weight of old customs, nor are they tyrannized over by circumstances or fear of neighboring nations. In a hemisphere they are supreme, and as kindness is their natural disposition, the world will expect them to bear the banner of the peace movement.

Such leadership would be in accord with their own history and the principles on which their government is founded. Never in all the annals of the world do we find such an instance of national self-sacrifice as was displayed here during the Civil War. Americans who had never seen a weapon used in anger left their homes and peaceful pursuits, took up arms, bore utmost hardships, braved utmost dangers, gave up all they held dear, and finally their lives, in order that slaves might be free.

In Washington recently I addrest the students of Howard University—about fifteen hundred of them—and I told them that they must be very good to the white race of America. I told them that they must never forget to be grateful and thankful. I said to them: "If you want to know really what great service the white race here has rendered to you, go to Africa and study the condition of your own race there." But at the same time I said that the white people here must be very kind to those whom they have freed. The white people must treat those whom they have freed with justness and firmness, but also with perfect love. America's example in freeing the slaves has been a power for freedom everywhere. Because America freed her slaves, even at the cost of one of the bloodiest wars of modern times, other nations have felt themselves bound to free slaves. America's leadership in humanitarian and altruistic matters is generally acknowledged. Instead of robbing the weak, she helps them. The nations look to America to lead them in good works.

I am here in this country making an appeal on behalf of universal peace, unity, love and brotherhood. I do not know how many Bahaists there are in America or in the world. There are no statistics in regard to this matter. If figures have been published they are without authority. Bahaism has no creed, no ritual, no dogma. Its principles are:

1. Love of humanity, shown more in act than in word.
2. Kindness to all the nations of the world.
3. Service to fellowmen.
4. Day and night love for all men must be shown so that the foundations of war and strife will be utterly destroyed.
5. The Bahaist must be the embodiment of truth, sincerity and faith.
6. The Bahaist must be free from religious prejudice, patriotic prejudice, racial prejudice, national prejudice.
7. The Bahaist must consider humanity as one tree, of which the various nations are the branches, leaves and fruit.
8. The Bahaist's religion must agree with reason and the true findings of science.
9. The Bahaist must live and act in accordance with the principles and teachings of all the prophets.

If a man does and believes these things then he is a Bahaist, no matter whether he calls himself Shintoist, Confucianist, Buddhist, Hindoo, Jew, Mahometan, Zoroastrian, Parsee or Chris-

tian. No matter in what church or temple he worships. All men are brothers. All have the same great Father. They have had different teachers, different views of the same great Light, and they quarrel about these little differences. It is all very wrong. They must cease quarreling, love one another, as Christ has commanded, and unite for good works for the glory of God.

One of the principles of Bahaism is the perfect equality of men and women, therefore the women of this country interest me greatly. They have advanced far, they have high ideals. They have demonstrated their right to the suffrage, and it has been accorded to them in many of the States, while the other States seem likely to follow this example. The women of America, then, will be a world force, and humanity everywhere will look to them for leadership in the movement for universal peace. The women of America are facing great problems,

ABDUL BAHA ABBAS
From a photograph taken with H. H. Topakeyan, the Persian Consul General to New York

but seem to have the wisdom and strength necessary for their solution.

Is peace always desirable? Undoubtedly it is. What is best in a family—peace or strife? Every good man will answer that family peace is best. So it is also with a nation, and so it is also with the whole world. In the United States of America forty-eight countries or States are gathered, living in peace with each other, and their enlightenment, happiness, progress and civilization serve as a model and inspiration to all men. It was not always so. Before Washington freed this country there were many wars and much strife and jealousy among the colonies. All that has gone, and peace, happiness and progress have come with union. The States support, love and are proud of one another, and what America has done, the rest of the world can do, following the example of America.

But would it be practicable for a country to lay down its arms and submit itself to the will of its neighbors—would not such a country be robbed and abused? Assuredly it is not practicable for a single country to disarm and trust the other nations to do justice for the sake of justice. Universal peace must be brought about by means of agreement among the great powers. They must assemble in convention, represented by their best and wisest men, and they must bind themselves by the strongest pledges and promises not to make war. Each should maintain an army and navy, but very small, merely enough to enforce order in its own territory.

Do not nations degenerate in peace? No. Again I refer to the example of America, which has prospered, grown strong and enlightened in peace and because of peace. I was in Africa and found warring tribes and much degradation. From there I went to Switzerland, and found peace with high enlightenment, intelligence, justice and respect for the rights of fellow men. There can be no question as to the blessings of peace.

But nature is full of war. Beasts, birds, reptiles, insects, rob and destroy each other. Surely; there is much in nature that seems not good. But man has mind and soul. He has knowledge of good and evil; and his relations with God and duty to his fellows. He has free choice, and surely it is better for him to be as the peaceful lamb or dove than as the ferocious wolf or eagle. There are many things in nature that seem evil, as the venomous serpent and the scorpion, but we who are men must choose the good.

What is good? That which bestows or preserves life and happiness is good. That which destroys life and happiness is evil.

The cities here are wonderful and interesting, but the great hight of the buildings oppresses me. They seem like beehives, with their crowds of inhabitants. The rooms are so small, like cells. I would feel stifled in such a building. We Orientals like low houses and plenty of room, with a garden in the middle and a fountain playing in the garden.

I will be in this country another month, but am going north now, for I find the heat here distressing. I will return to Syria by the way of England and France. The voyage here from Alexandria lasted fifteen days and the long confinement on shipboard was tedious. The return voyage to England will only last about five days, and that will not be so bad. Then I can journey in leisurely fashion thru England and France, tarrying at times with friends, and when I reach the Mediterranean I will be but two or three days' journey from home.

New York, July 19, 1912.

Some Sayings of Abdul Baha

"Asceticism is not necessary. A soul grows by the exercise of human virtues, and the observance of human morals, and by the Divine Favor. The extreme asceticism of the saints was superstition. The monasticism of the Christian Church was mistaken. St. Paul was responsible for much of this because in one of his epistles he praised those who do not marry, and prophesied that sects would arise which would not marry. St. Paul disapproved of marriage. But God did not give us good gifts that we should reject them. He created all these blessings that His servants may bless Him.

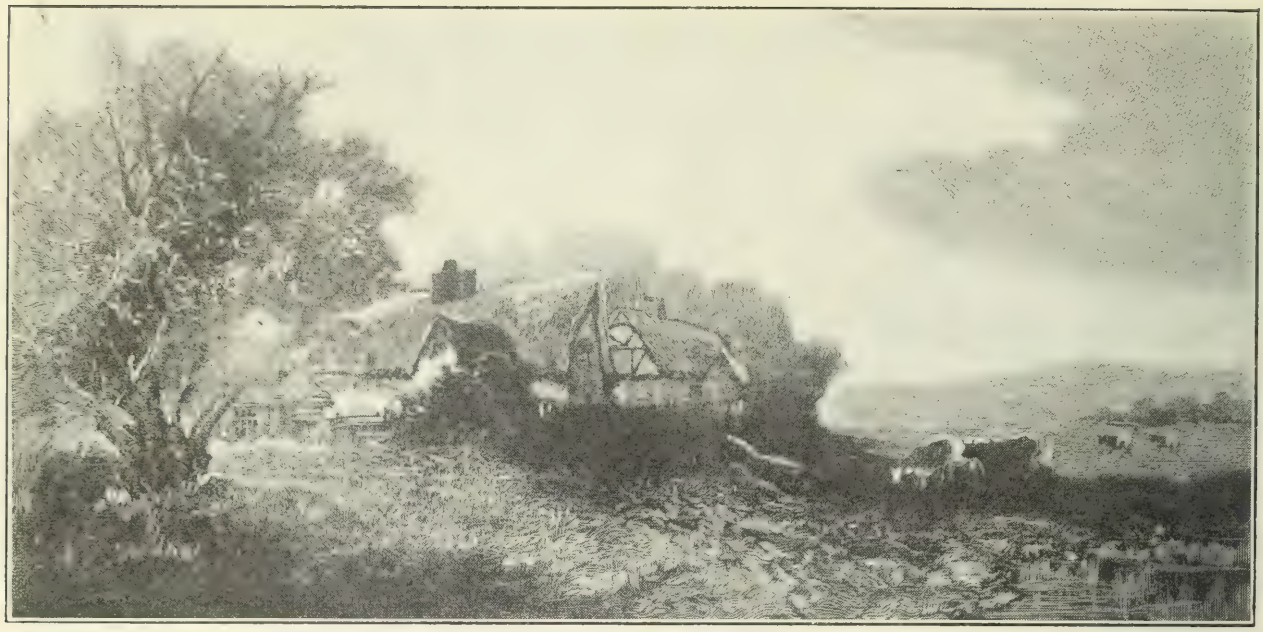
"God knows better than all. He has given us an appetite, therefore we should eat. If the body is deprived of what is necessary to it the mind suffers. God asks of us accord-

ing to our capacity. If a man who has only sufficient strength to carry fifty kilos be burdened with a hundred kilos he will fail. Moderation and common sense must be used.

"We in our religion do not dwell upon the miraculous. A man once wrote a book in which he enumerated the miracles of the Bab. Baha U'llah burnt it lest it should be the cause of later superstition. And he forbade his people to talk of these things. . . . They tend to lower a religion and to make people think about the things that are not important. Which is most important, the miracles or the life of Christ? And yet, because people have not been able to believe these miracles, they have doubted the teachings of Christ.

"God knows the wishes of all hearts. But the impulse to prayer is a natural one, springing from man's love to God. If one friend feels love for another he will wish to say so. Though he knows that the friend is aware that he loves him, he will still wish to say so. If there is any one that you love, do you not seek an opportunity to speak with him, to speak lovingly with him, to bring him gifts, to write him letters? If you did not feel such a desire, it would be that you did not love your friend. If there be no love, if there be no pleasure or spiritual enjoyment in prayer, do not pray. Prayer should spring from love, from the desire of the person to commune with God. Just as a lover never ceases from wishing to communicate with the beloved, so does the lover of God always wish for constant communication with the Deity. Prayer need not be in words but rather in thought and attitude. But if this love and this desire are lacking it is useless to try to force them. Words without love mean nothing. One may attain to the love of God by studying the manifested greatness, love, wisdom and providence of God. The lover of God desires and adores Him because of His perfections.

"To be a Bahai simply means to love all the world, to love humanity and try to save it; to work for the universal peace and the universal brotherhood."



Modern American Wood-Engraving

BY W. A. BRADLEY

Author of "William Cullen Bryant," etc.

THE statement is often made, and appears to be widely accepted, that American wood-engraving is now altogether a thing of the past, and that there remain but two active survivors of the famous "new school" which once played so important a role in native art—Mr. Timothy Cole and Mr. Henry Wolf. This is far from the truth. There are other excellent engravers still at work, and it is doing them but simple justice to correct the false impression which obtains concerning the status of their art today, and to direct some attention to their achievements. These are often of an even higher order than their best work in the palmy days of wood-engraving. For many of these artists were among the younger recruits enlisted just before the decline began, and have only now reached the full maturity of their powers. Also the opportunity is greater today for individual expression. There is, for example, less of that element of specialization which tended to subject engravers to a sort of routine whereby one who showed an aptitude for handling fine detail, received only those subjects which required such treatment, altho he might, personally, prefer a broader style, and long for a chance to employ it. Under a less rigid system of selection, this has now been made possible, and several engravers have displayed a variety of technique, and a talent for imaginative expression, which were not discernible in their earlier work, and which have surprised even their friends and fellow-engravers.

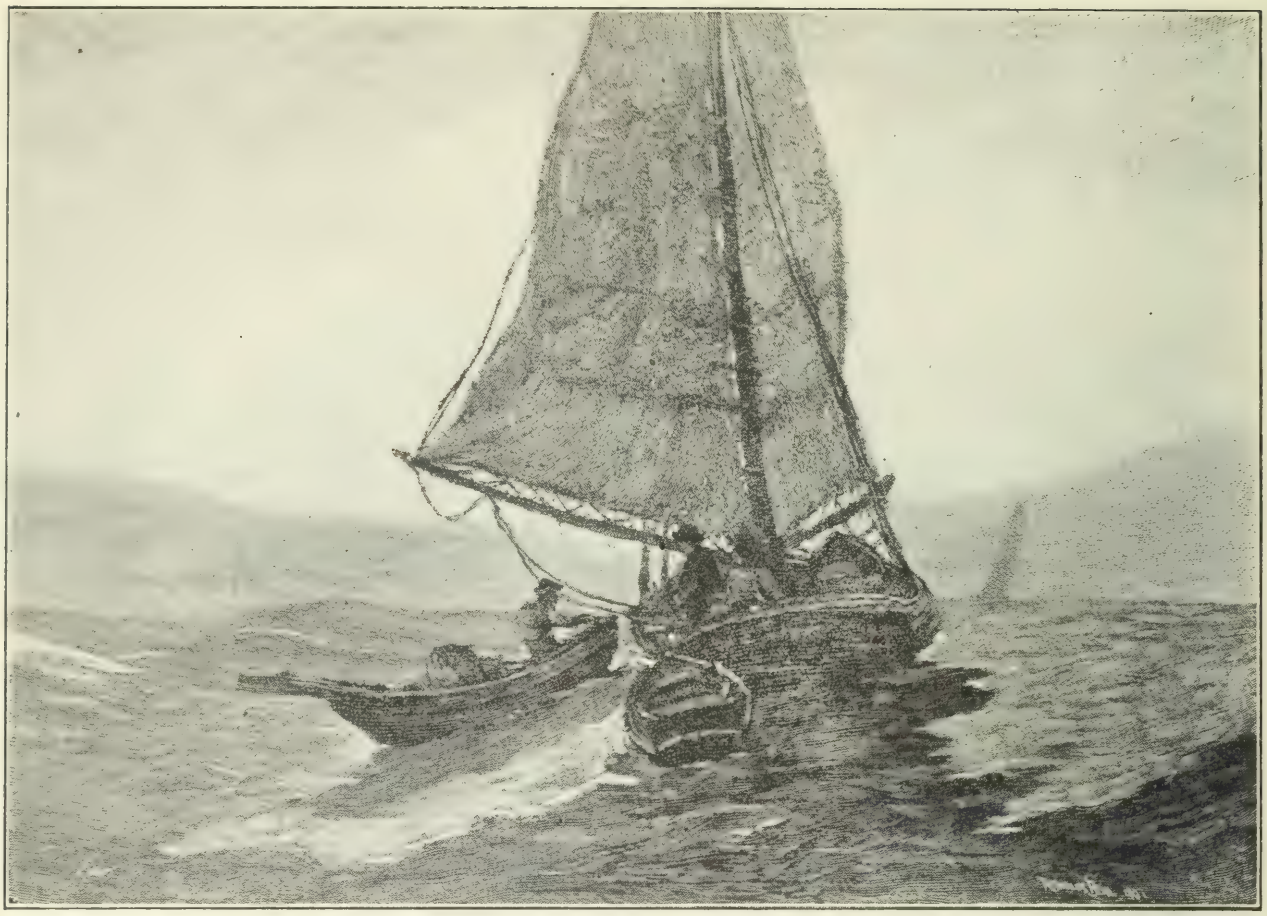
That there has been of recent years what almost amounts to a revival of wood-engraving on a small scale, is due largely to the enterprise of a well-known women's magazine. When Mr. E. G. Russell, now dead, left *McClure's* in 1907 to assume the art directorship of the *Delineator*, he was so fortunate as to secure the services of an engraver who, having served his apprenticeship under Smithwick and French, had won for himself a high place among American wood-engravers. This was Frank H. Wellington. Unhappily, it is no longer possible to number Mr. Wellington among the survivors of the "new school." For last September he died from the effects of eating poisonous mushrooms just after he had finished a

LINE ENGRAVING ON COPPER BY S. J. NORTHCOTE

large block after a painting by Mr. Harry Townsend. This engraving, a proof of which is now on exhibition at the Public Library, represents the culmination of his art. The character of this I tried to define in a letter which I wrote to the New York *Evening Post* after his death and in which I spoke of his "ability to control the direction of his line so as to create form"—the essential gift of the engraver. "His subtle and suave linear modulations," I continued, "gave to his modeling the very roundness and relief of life, besides introducing an element of spiritual grace and sensuous movement into his most solid constructions." His line was the very soul of poetry—a long, liquid line that seemed to *ripple* across the block, and gave the full and free expression of the engraver's deep sensibility. His engravings were saturated with tone, color and atmosphere, and his feeling for texture, whether of inanimate objects, or of firm and tender human flesh, was simply delicious. Tho he was employed on the best class of illustrations—some of his blocks after drawings by Mr. Thomas Fogarty are charming and worthy of the portfolio of any collector—his reputation unquestionably suffered thru his not having been identified, like Mr. Cole and Mr. Wolf, with the reproduction of acknowledged masterpieces.

If Mr. Wellington was one of the younger men of the "new school," Mr. J. W. Evans began way back in the '70s, with Cole and Juengling and Kingsley, when the employment of the camera, for putting the picture on the block, revolutionized wood engraving and opened the way to its future triumphs. His career was closely associated with the careers of two illustrators, famous in their day, Burns and Kelley. He was particularly successful in his treatment of marine subjects, and it was with a marine by Mr. Reynolds Beal that he not long since returned to the practice of wood engraving. This painting, which is entitled "Gloucester Fishermen," shows a fishing smack hove to on a heavy swell, while a man seated at the stern talks with another, standing up in a dory alongside. Not only is the very feeling of the scene rendered perfectly, so that we feel the heave of the sea, the slow rise and fall of the two boats, and the flapping of the sail as the boom swings heavily, but the subtle effects of light and shade in early morning upon the water, when the sky is full of the mysterious promise of the dawn, are given with all the resourcefulness of the "new school" style, which uses cross lining and stipple to supplement the pure linear technique of earlier engravers.

"I am writing to tell you how much I appreciate the charm and salt water quality you have worked into the plate," said the artist in a letter to the engraver. "You must have the marine element



very strong." And this praise is certainly well deserved. More recently Mr. Evans, deserting the marine field, has engraved an early painting by Sargent, entitled "A Venetian Interior," as well as Renoir's great painting of "La Famille Charpentier," in the Metropolitan Museum, and is at present engaged on a block after the painting by George Bellows, "Commencement at the University of Virginia." In all of these the problem set himself by the engraver is peculiarly difficult as, owing to the impressionistic style of the painting, there is in them a lack of that "edge" which is required by many engravers in any subject they undertake.

Evans, like Wellington, has worked almost exclusively for the magazines. Other engravers, however, have found it possible to keep employed on blocks for societies, or for private subscription. One of these is William G. Watt. Mr. Watt, perhaps more than any other engraver at work today save Mr. Wolf, embodies that ideal of the "new school" which most completely sets it apart from other earlier schools of wood engraving: the exact rendering of textures, so that it is possible to tell at a glance the precise medium in which an original was executed. This was the result of the adoption of the photographic method of placing the picture upon the wood, and of the consequent possibility of reproducing any original—not merely that drawn on the block by the artist himself. With this innovation, the conception of fidelity in reproduction became enlarged, and engravers grew emulous of each other in the effort to represent the characteristic differences between say, an oil painting and a charcoal drawing — to indicate the brushmarks of the one and the rich, crumbly line of the other, the *fusain,* in the other. Without going to the extremes of rather servile imitation reached by some of the earlier engravers, in whose work this practice became mere virtuosity and an abuse of their art, Mr. Watt does manage, with great taste and intelligence, to preserve the character of the medium both in oil and charcoal. He has made a number of important blocks, one of the best of which is that of Gabriel Metsu's "The Music Master," in the Metropolitan Museum. Two other blocks are interpretations, one large and one small, of his own painting, "The Pool." This particular kind of work—

THE WINE OF CIRCE.

From a wood-engraving by Mr. Walter Aikman after the famous painting by Sir Edward Burne-Jones

GLOUCESTER FISHERMEN
From a wood-engraving by W. J. Evans after a painting by Reynolds Beal

self-reproduction, it may be called—ranges Mr. Watt with Mr. Wolf, who, as Mr. Frank French recently pointed out in the New York *Sun*, is often incorrectly credited with being the first engraver to work from his own originals. Mr. French himself, when he was engraving, made many similar experiments, as did others. Indeed, there was at one time a society called "Original Workers on Wood" which aimed to establish more firmly the status of the engraver as an original artist, and comprised several of the better known men. One or two of these, notably Mr. Elbridge Kingsley, even went a step farther by engraving directly from nature, without the interposition of any original whatsoever, thus putting wood engraving on a precise par with painter etching.

Mr. Watt has recently finished, for subscription, an important engraving of a painting by the Russian artist, Nicholas Fechin, owned by the well-known collector, Mr. George A. Hearn, of New York. The principal motif in this portrait of a woman is an elaborate arrangement of a Persian shawl. The delicate iridescence of its glowing and intricate weave, charmingly indicated by the painter, affords a fascinating problem that would fill most engravers with dismay. Mr. Watt's treatment of it is a marvel of linear interpretation, guided not by any hard and fast rules of engraving, but wholly by an instinctive selection of the means best adapted to secure the desired result.

Mr. Walter M. Aikman, another first-rate engraver who works largely for private subscription, has executed a number of beautiful blocks. The latest, after a painting by John Crome, for a society of bibliophiles, places him second only to Cole in the interpretation of the English landscape school. His style, however, is quite different, being much finer, if not more subtly suggestive, in execution, and with more sense of an original in the background than in the case of Cole's wonderful blocks after

Constable, where, so completely has the artist felt the scene as a personal experience, and reconstructed it in his own imagination, that they might quite as well have been studied directly from nature. A very beautiful earlier engraving of Aikman's is his "Wine of Circe," after Burne-Jones.

If we were merely making a list of the engravers who are still living, without respect to their present activity or inactivity, we could summon many names famous in the past, like French and Kingsley, for example, both of whom have abandoned engraving for painting, but who still talk of taking up their tools again some day. Perhaps in the future, before it is too late, America will realize the artistic ability that is going to waste in these men, and will devise some means of impounding it. There is certainly plenty of material today for a very noteworthy revival of wood engraving. There are men who could become teachers as well as executants, and it will take another generation for the "new school" to disappear as a whole. The expression, "old engraver," so often heard in speaking of the survivors of the golden age of American wood engraving, is misleading. Schwarzburger, Vanness, Clement, all of whom still engrave as occasion requires, are old men, but Chadwick, Merrill, Aitken, Northcote, are still in the prime of life. All recently have done important work —work that displays powers which are shamefully dissipated when employed in the finishing of process plates.

The question, however, arises, whether there will ever be a revival of wood engraving. It went out, as we know, because it could not stand competition with inexpensive photo-engraving. In an article in a recent number of *The Print Collector's Quarterly*, I hazarded a suggestion, based upon personal knowledge and experience, that the very factors of production that caused its decline and fall might possibly operate to reinstate it once more. Tests have proved beyond the shadow of a doubt that the wood block is at once easier and cheaper to print from on a long run than the half tone, besides giving a better impression and therefore a superior product. Also, on an edition of a million and two million copies, the greater first cost of the wood block, a serious consideration when editions ran to only fifty or a hundred thousand, now becomes comparatively insignificant. The practical printer and the business man who have once employed the wood block become its most powerful advocates.

The most serious argument against the revival of wood engraving as an ordinary reproductive process is that first-rate engravers always have been and always will be few, and that everything depends upon the engraver. It is this that makes it so hard to argue the relative merits of wood engraving and photo-engraving. The most that can be said for the latter is that it can be rendered invariable in its results, while the former can and does vary considerably with the engraver himself. Not only are there good engravers and bad engravers; but, being an artist, the best of them is likely to make mistakes or to fall below his own level. And while it is undeniable that a good wood block is better than the best half tone, it is equally certain that a good half tone is better than a bad, or even a merely indifferent wood block. The chief danger is that, under pressure, it, too, will tend to become mechanical. For nothing is so unpleasant as the work of a man who, thru being "speeded up," turns himself into a machine. This is what the increasing demand for illustrated periodical literature led to in the old days, and one fears that the evil might now become greatly intensified if there were ever a return of wood engraving to general favor. There is, however, very little prospect of such a return at present, and the art is likely to be left to develop, for some time to come, on the higher and, from its own point of view, more advantageous basis of economic and creative independence.

New Canaan, Conn.

The First International Eugenics Congress

BY RAYMOND PEARL, Ph.D.

[One of the foremost of the American representatives at the London International Eugenics Congress was Dr. Pearl, who is the head of the biological department of the Maine Agricultural Experiment Station and has for many years been engaged in the study of the problems of heredity under the auspices of the United States Fish Commission, the Department of Agriculture and the Carnegie Institution.—EDITOR.]

THE First International Eugenics Congress, which was held at the University of London from July 18 to 24 last, gave visible and tangible evidence that, all over the civilized world, thinking people at last are giving serious consideration to eugenic problems, upon a working solution of which the further progress of the human race depends. The attendance at this congress was altogether larger than had been expected. On the day before its close I was informed by the assistant secretary in charge of registrations that 836 persons had taken full subscriptions to the congress. In addition to these there was a considerable number of daily visitors. Of those in attendance the majority were, as a matter of course, English. The Continental countries were, however, well represented, not only in point of numbers, but more particularly in respect of the eminence of their delegates in the fields of science or public affairs. The French delegation included the distinguished biologist, Prof. Yvès Delage; M. Lucien March, director of the Statistique Générale of France, and M. Paul Doumer, formerly president of the Chamber of Deputies. Germany was represented by his Excellency General von Bardeleben, of Berlin, and Dr. Alfred Ploetz, who has been one of the leaders of the eugenics movement in that country. From the United States Mr. Bleecker van Wagenen, of New York; Prof. Vernon L. Kellogg, of Stanford University, and Dr. Frederick Adams Woods, of Boston, acted on the executive committee of the congress. There was a surprisingly large number of American "laymen"—persons not professionally interested in eugenics or its supporting sciences—in attendance. The very small or non-existent representation of "new" countries or rapidly developing countries like Canada was striking. It illustrated very well the obvious fact that eugenic problems become pressing in direct ratio to the age of a civilization.

The keynote of the papers and discussions, taken as a whole, was that the congress was dealing with *problems,* not *solutions.* The working motto was, "What are we going to do about it?" It was a splendid clearing of the field for action. If there exists an illness or weakness of the body social which was not at some time during the proceedings, in some manner or other, brought forward for consideration, it is one that the writer, at least, has not yet heard of. Free and untrammeled discussion was the order of the day. Every one was given an opportunity, if he desired it, to air his pet grievance or propound his panacea. While this abundant discursiveness, coupled with an unfailing seriousness and earnestness on the part of those involved, which the gravity of the general subject matter in hand certainly warranted, tended at times to put a severe strain upon an American sense of humor, nevertheless it served the real purpose of the congress excellently. No one is prepared yet to say the final word regarding any eugenic problem. Therefore it is well to have as complete an exposition as may be of all possible factors which must be taken into account. If any one feels deeply that cigaret smoking is the primal curse of the human race, by all means let him (or more strictly, her) say so, and get this "in the evidence." The verdict of really enlightened public opinion on the matter will be quickly obtained thru the manner in which the point is received by such a body of people as made up this congress.

As with every new social movement, there was manifest a curious mixture of

the rational and the emotional in the intellectual processes of the audiences in attendance. While undoubtedly the primary and basic reason for being there at all and being interested in eugenics, on the part of nearly every one, was a purely reasoned conviction that in this movement is the germ of a truly scientific grappling with the most fundamental of social problems, yet the discussion of these problems from whatever point of view quickly stirred the emotions. One speaker would lay stress on heredity as the great controlling factor, to which all else was secondary. The earnestness with which he would be listened to, and the hearty, whole-souled applause with which he would be received left no doubt that here was a basic fact on which all were agreed. But the very next speaker might argue (as one did) that all children were equally well born, and that their social worth, not alone in respect of their own but of future generations as well, depended upon the environment in which their lives were spent. Equally hearty and apparently quite as whole-souled were the "Hear, hear's." One could but feel sympathy for the perplexed newspaper reporters, whose number was legion, and who were doing their best to catch the real underlying spirit of the congress, and making, by their own confession, distinctly heavy weather of it.

The formal papers, which were published in a stout volume of 490 pages ready for distribution at the opening of the congress, attained a distinctly high general average of excellence. Taken as a whole, the volume, very aptly entitled "Problems in Eugenics,"* is by a great deal the most significant contribution to "practical" eugenics that we have yet had. It should be in the library of every one in any way interested in the subject.

Fundamentally there was general agreement among all present as to certain necessities in the eugenic campaign. First of all is the great need for education. The young of all classes of society must be taught the general facts of heredity, in such a way as to make it clear that they are not abstract, impersonal propositions, like the theorems of geometry, but are real, vital, human matters which concern every one of us in the most direct and personal manner. In this way, and in no other, can a personal sense of duty to future generations and to the race be made an integral part of the individual *ego*. Secondly, the biology and hygiene of sex, in the broadest sense, must be made a definite and important part of this training of the young. Quite apart from the cogent individualistic reasons in favor of such teaching, it is a thing which is imperatively required by society for its own self-protection. The sessions devoted to this discussion of the best ways and means of eugenic education were perhaps the most valuable of any. In this connection must be mentioned the brilliant paper—one of the most notable of the entire congress—of Prof. F. C. S. Schiller, of Oxford, on "Practicable Eugenics in Education," in which he showed "how education can be made to help eugenics, believing that if we struggle manfully against some of the most popular but unscientific of educational nostrums we may conserve and improve some eugenically valuable institutions, and implant in the young eugenical sentiments which in due course will bear fruit in better morals and more serviceable citizens."

Two large rooms at the Imperial Institute were devoted to the exhibition. Here were displayed charts, photographs and specimens to illustrate facts and principles of eugenics. There were extensive and instructive exhibits from Germany, and from the Eugenics Section of the American Breeders' Association. One of the most striking features of the exhibition, and a distinct credit to the workers who prepared it, was a pedigree chart 147 feet long and including over 800 individuals of a single polygamous Utah family. Prof. R. C. Punnett, F. R. S., of Cambridge University, the distinguished authority on genetics, exhibited a series of rabbit skins and of sweet pea blossoms (sent fresh each day and ingeniously displayed on a pedigree chart in glass test tubes), to show Mendelian laws of inheritance. Probably no other exhibit attracted so

*This volume may be obtained at a cost of 8 shillings 6 pence (about $2.10) from the Hon. Secretary, Mrs. S. Gotto, Eugenics Education Society, 6 York Bldgs., Adelphi, London, W. C., England.

much attention as this. The Neo-Malthusian League showed a series of rather lurid charts, intended to demonstrate that the artificial restriction of the birth rate was a thing greatly to be desired. The doctrines of this body, by the way, were kept very much to the fore thruout the congress by its enthusiastic representative, Dr. Drysdale.

No account of the congress would be complete without some mention of the entertainments provided for the delegates. English hospitality is proverbial. The tradition was not dimmed on this occasion. On the opening evening an inaugural banquet and reception at the Hotel Cecil brought together over 400 guests, including many of the most distinguished persons in English scientific, official and social life. On following evenings during the week receptions were given to the members of the congress by the Duchess of Marlborough, Mr. Whitelaw Reid, the Lord Mayor of London, and Major Leonard Darwin. On Sunday Mr. Robert Mond entertained the congress at a luncheon and garden party at his country house in Kent. All these things, together with private dinners, luncheon parties, teas and the like, made one realize the great significance of environment in eugenic *deliberations,* at least.

Altogether, the congress was a great success. The administrative details involved in carrying it thru were worked out exceedingly well—indeed, almost perfectly. The Eugenics Education Society and its officers, who conceived the idea of the congress and made it in fact the brilliant success that it was, may well be proud of their work, and of what they have done for the promotion of the cause thru this congress. Most of all, credit is due to that wonderfully efficient organizer and executive, the honorary secretary of the Eugenics Education Society and the congress, Mrs. Sibyl Gotto.

ORONO, ME.

Caliban in the Coal Mines

BY LOUIS UNTERMEYER

God, we don't like to complain;
We know that the mines are no lark,
But—there's the pools from the rain,
But—there's the cold and the dark.

God, You don't know what it is;
You, in Your well-lighted sky,
Watching a meteor whizz—
Warm, with the sun always by. . . .

God, if You had but the moon
Stuck in Your cap for a lamp,
Even You'd tire of it soon
Down in the dark and the damp. . . .

Nothing but blackness above,
And nothing that moves but the cars—
God, in return for our love,
Fling us a handful of stars!

NEW YORK CITY.

Literature

A New Novel by Maarten Maartens*

We never blamed him for taking another name and writing in another language. It would be a bother to have to sign checks Joost Marius Willem van der Poorten-Schwartz. And if he had used Dutch as his literary automobile we could not have read his novels and so would have missed a great deal of enjoyment out of life. We have read every one of them, beginning with "The Sin of Joost Avelingh," in 1889, and that was long before we were hired to read novels. He has Ibsen's knack of picking up a little group of people anywhere, in any little Netherlandish country town, and making of them cosmopolitan characters, in whom we can all take an interest, in whom we can recognize our own neighbors if not ourselves. And this, too, without destroying their individuality by a process of generalization. He does not fade out the local color in the hope of thereby interesting a wider circle. On the contrary, he paints in all he can with true Dutch art, knowing that if he can portray real human beings somewhere they will stand transportation anywhere. For example, here is a lady we never saw but whom we instantly recognize:

"The Dowager Baroness Bigi van Tietstjumperadeel en Borrelhuyzen *née* Countess Stemmert was known all over Holland for the virtues she did not possess. That was the one supreme cleverness in an otherwise quite stupid and ignorant woman. She had built up, thru judicious patronage of pious toadies, a sort of account current in the fruits of the Spirit. A few of her own circle knew better but kept silent from a mixed feeling of clannishness and fear. She was wealthy, lived simply, gave largely, and had relatives as many as she needed and yet more who needed her. Her great joy thruout life was that she had been born a Countess Stemmert. Her fine bearing was perhaps a little too conscious of the fact: it suggested that she had swallowed the traditional poker. But she had not: the poker was hereditary; it had been swallowed four centuries ago. Her fine head stood crowned with a cloud of glory; her eagle beak was at once suggestive of Imperial Rome and *police verso*. Her black dress must have cost five pounds inclusive of its spectacular train. She sat in the midst of her half-moon of pale daughters, who worshiped her and whose life she rendered an inferno, while she deemed it a purgatorio."

Maarten Maartens is a kindly satirist, not bitter or cynical after the fashion of our younger writers. That is why they let him live in Holland and write about his neighbors, even after his books have been translated into Dutch.

We are not saying much about *Eve* because, as a matter of fact, we have not read it yet. The passage quoted above we happened upon as we brushed over the leaves. No doubt, if the finger had caught upon any other than page 132 we should have found something quite as characteristic and delightful. When you have known an author as long as we have known Maarten Maartens, and he is as reliable and steady-minded a man as Maarten Maartens, you do not have to read his latest volume before commending it to your friends or even buying it yourself. The reason why we are writing this review in advance is not because we want to get out of reading the book. Quite the contrary; it is because we want to get the review out of the way and off the mind, so we can read the book at our leisure and in an unprofessional spirit, taking it home and reading its epigrams and choice bits of characterization to the family circle. For a book of Maarten Maartens is something to be sipped slowly and savored. It is not one of these modern novels that have to be swallowed at a gulp, like a dose of medicine, because if you stopped to think about it you never would get it down.

*Eve. *By Maarten Maartens.* New York: E. P. Dutton & Co. $1.35.

Art and Environment

It is an oft repeated observation that the spirit and character of a people are most fully exprest in their art, but the relationship therein asserted has usually been regarded as a general correspondence in mental equipment and artistic endeavor, and its significance has been exhausted in indicating the de-

gree of culture attained. Few have looked upon the characteristic styles as due to certain clearly defined racial attributes and instincts. Greek art, for example, is conceded to be indicative of the gulf which separated the Greek civilization from the old Babylonian, but writers generally have been content to note the varying power of these peoples to appreciate the beautiful and to emphasize the resulting excellence or defects of their artistic productions, and no attempt has been successfully made to point out the particular racial traits that have left their indelible stamp in the distinctive features of the art itself. Mr. Lisle March Phillipps, in his stimulating volume of essays on *Art and Environment,** enters this new and difficult field and traces some guiding lines with remarkable success. His familiarity with the history and criticism of art, his literary skill, and the generous molds in which his thoughts run, are serviceable assets in taking up the task of setting forth the contrasting social and racial characteristics which have been incorporated and exprest in the art of some great creative epochs. The discussions are based mainly on architecture, as in the view of the author this is the most representative and broadly human of all the arts. Egypt furnishes the example of ancient art, and in the chapters devoted to this subject Mr. Phillipps takes the opportunity of going a step further, and shows how both art and mental makeup are deeply affected if not controlled by natural environment. He believes that a careful scrutiny and subtle analysis of Egyptian character and civilization reveal not only the fact that the social, intellectual and religious life of the Nile Valley was faithfully reflected in its art, but that both art and life were dominated by the tyranny of the great river. The beneficent ebb and flow, the endless repetition and unvarying routine, on which hung the very thread of life, produced mental slavery and stagnation, withdrew from art its needed intellectual stimulus, and left it to persist in primitive and archaic, not to say childish forms. With the coming of the Greeks into the artistic life of the world, proficiency of practice gave way to proficiency of thought, for the dominating influences of Greek life were intellectual insight, power and breadth. Art accordingly became versatile, vital, and definitive, a source of ideas as well as an expression of character.

Especially fruitful is Mr. Phillipps's study of Gothic architecture, in which he finds embodied the genius of the northern nations. Without seeking to explain or account for this vigorous and fascinating style, the author interprets its deepest meaning in terms of personal energy and force. The pointed arch, the vaulted ribs, the flying buttresses, the guiding lines and moldings, all produce in the observer the sense of energy and action, and manifest the invisible strains continually operating in the structure, thus proclaiming in unmistakable terms the virility, individual initiative and self-assertion which the new races of the North were contributing to the world's store of civilizing influences. Mr. Phillipps's conclusions are worthy of careful consideration and his volume shows the possibility of so relating art to life that it becomes charged with interest for that intelligent multitude who find no pleasure in classifying into schools and styles and reproducing mummified opinions on the different types of excellency.

Mary Tudor, Queen of France. By Mary Croom Brown. New York: G. P. Putnam's Sons. Pp. x, 280. With 12 Illustrations. $3.50.

In the half century which has elapsed since Mrs. Everett Green's researches illuminated the romantic life of Mary Tudor, much new material has been discovered, some of it very important, in the piecing together of mutilated manuscripts. Of this Miss Brown appears to have taken full advantage. And she has, in spite of the labor which has obviously been expended upon the work and of the formidable array of footnotes thru which inquisitive students may check statements of fact, written in a free and sprightly style, such as accords well with the personal character of the story. The intimate details of court life are laid before us. It is true that history, which used to delight so in the gossip of kings' mistresses and in the subtle transactions of diplomatists, now occupies itself

*Art and Environment. *By Lisle March Phillipps.* New York: Henry Holt & Co. $2.

rather with the deeper social and economic forces; that the world in which the sister of Henry VIII moved seems to us moderns a little world of tinsel and etiquet, hardly worth the attention which investigators have bestowed upon it. Yet any faithful picture of life in another age has a compelling interest, and all the more so when it tells the story of true love at first disappointed and finally triumphant. Whose sympathy will not go out to Mary after the death of the king whom she had married under compulsion; separated from her countrymen, confined to her bed for six weeks by the rigid custom of the court, with drawn curtains and subdued candle light, apprehensive of the future, longing for Suffolk, and assailed by the new king with proposals which were "not according with mine honour." Miss Brown has added quaintness to the narrative by quoting freely from correspondence and other contemporary documents, and in the hands of this historian the famous romance loses none of the dramatic quality which it had in Major's popular novel.

The Principal Girl. By J. C. Snaith. New York: Moffat, Yard & Co. $1.25.

A new novel from Mr. Snaith is always a matter of interest and speculation. Will it be serious? Will it be whimsical? That it will be original and interesting is not a matter of question. *The Principal Girl* is worthy of the author of "Araminta." It is a pretty comedy of manners, and the mutual jealousy and arrogance of the respective families of the "principal girl," belonging to an "old theatrical family," and the son of a British peer, are told in the gayest and most charming way. The hero is a bit stupid, but has the good sense to appreciate a girl of gold when and wherever he finds her, and he is rewarded by winning a sensible and capable as well as beautiful wife, who proceeds to make her husband a successful politician. There are numerous sly hits at rival novelists, "Mr G-lsw-thy, Mr. H. G. W-lls and Mr. Arnold B-nn-tt," as in this description of the honeymoon:

"They should have been profoundly weary of one another by the fourth day in Paris, according to all the rules of the game. He should have discovered that she was shallow and half-educated, and consequently a bit of a bore when she brought the same face downstairs three mornings consecutively for *café au lait*. She should have discovered that he was selfish and vain . . . and that he saw already what a fool he had made of himself. He should have secretly cursed his gods for the blindness that had shackled him for the rest of his days; she should have had thoughts of the Seine, and have given them expression. . . . But candor forces us to make full confession of our incompetence. Because none of these things came to pass." What really imprest the beholder was the "comeliness of both; the simple pleasure they derived from the society of each other; their abounding joy in being allowed to walk about this underrated planet."

The Red Lane. By Holman Day. New York: Harper & Bros. $1.35.

Vétal Beaulieu is a saloonkeeper on the frontier of New Brunswick and Maine. He is a rich man, and educates his daughter Evangeline at a convent school, but does not tell her how he makes his money. When she comes home unexpectedly she is doubly shocked, for it is a night of wild smuggling and the movable bar on the boundary line is doing a rushing business. Next morning Evangeline leaves home, if one may call it home. Before she is married to the young American customs officer who stalks heroically thru this romance there are many diverting and moving incidents. Not loving and smuggling alone, but squatter rights and evictions furnish thrills. The character work of Mr. Day is done with broad strokes of the brush. French Canada furnishes him not only with a beautiful heroine, but with several villains and the divers picturesque figures without whom no such tale as this would be complete. And it is an exciting tale, too, from page one onward.

Where There's a Will. By Mary Roberts Rinehart. Indianapolis: The Bobbs-Merrill Company. $1.30.

Since "Ships That Pass in the Night" was written we have had several novels with their events occurring in sanatoria; most of them gloomy enough. But Mrs. Rinehart succeeds in making "Hope Sanatorium" in *Where There's a Will* a cheerful and exciting place. A curious will provides that the heir of the old doctor who had run the sanatorium must

conduct the place successfully for two months or lose his heritage. The heir is missing, but a double is engaged to take his place, and the reforms, hygienic and medical, the pseudo-proprietor inaugurates, together with one of the author's most intricate plots, make a sufficiently adventurous story, enlivened with considerable humor of an obvious kind. "Start any excitement in a sanatorium, and one and all they'll dip their thermometers in hot water and swear they've got fever!" We wonder how the patients at the Hope Sanatorium survived all the excitement that prevailed there during the two fateful months of probation.

The Nets. By Stuart Henry. New York: Brentano's. $1.25.

What is the use of spending time and money in going to Paris? You only see the outside of things, after all; not much more than you can get from a set of picture postals. But if you buy and read Mr. Henry's novel, which you can do for less expenditure of money and time than the cheapest expedition planned by Mr. Cook and his son, you will get an inside view of French life such as you would not be likely to acquire in many years of residence. Mr. Henry loves his Paris and delights to linger at the street corner, noting quaint characters and characteristics, listening for curious idioms. How he managed to live long enough in Paris to learn it so well and yet preserve the tourist's naïve wonder at all he sees and hears is a mystery. But, naturally, a loitering spectator like Mr. Henry is no fit companion for the reader who wants a sensation at the end of every chapter and a plot so thick that it can be cut with a knife.

Heritage. By Valentina Hawtrey. New York: Duffield & Co. $1.30.

If English life were really what is portrayed in English novels we should despair of the country—or rather we should not care a snap what became of such a sordid, mercenary and materialistic people as the English make themselves out to be. Fortunately, we know them better than they appear to know themselves. In this novel, as in a thousand others, the question of who has inherited an estate is the dominant motive, and marriages are made, friendships broken, homes ruined and professions chosen, all with that in view. But such maligning of the British character is common to most British authors, and we have no other fault to find with this novel. It is a clean and well told tale, with clearly portrayed characters.

The Gift of Abou Hassan. By Francis Perry Elliott. Boston: Little, Brown & Co. $1.25.

To those readers who are tired of realism in their novels this iittle tale may be recommended on that ground at least. A magic rug possessing the power of making any one who stept on it invisible is a strange bit of stage property to introduce into a love story of the twentieth century and one fraught with interesting possibilities. Some of these possibilities are utilized from time to time to help the lovers out of tight places and to help the girl's dragonish old aunt into them. The eccentric plot and the more eccentric characters raise the reader's hopes unduly at first and he is sorry to see the story lapse into commonplace farce in the latter half of the book.

Campus Days. By Ralph D. Paine. New York: Charles Scribner's Sons. $1.50.

These stories of Yale college life remind the reader of Owen Johnson because they are so strikingly different from "Stover at Yale." Here there is lacking the spirit of criticism, the revolt against the tyranny of college tradition. Yale athletics, Yale spirit, Yale patriotism remain all but unquestioned idols. Not quite unquestioned, for in at least two stories there is a conflict between the *mores* of the college and those of an individual. In each case, however, the triumph goes to the former. That the reigning spirit of the great university has strong powers for good is witnessed in these tales, which blossom with cases of loyalty, courage and sterling friendship, and make the book sentimental in the best sense. The humor of the book is not that happy-go-lucky exaggeration which we associate nowadays with the name of Siwash, but a quieter and more conventional type appropriate to the older and more historical institution. Whether the reader

cares for campus short stories, of which we have had so many hundreds of examples, or not, at least he cannot say less for this book than "well done of its kind."

Literary Notes

....A new popular edition of *Business: The Heart of the Nation,* by Charles Edward Russell, vice-presidential candidate of the Socialist party, is announced by the John Lane Co.

....Lester G. Hornby, a young American who has already won a reputation as an etcher, and who has illustrated books on Paris and New York, has drawn a series of pen pictures for T. Russell Sullivan's *Boston, New and Old,* announced by Houghton Mifflin Co.

....Our colored contemporary, *The Crisis,* New York, issues a "Woman's Suffrage Number" for September. None can plead with more force against the injustice of discrimination against a sex than those who have felt the injustice of discrimination against a race.

....The organization, the doctrines and the psychology of the Mohammedan Dervishes of Turkey have found an English interpreter in Lucy M. J. Garnett, who writes *Mysticism and Magic in Turkey.* The volume has numerous illustrations, and is published by Scribners ($1.75).

....A second edition of *Side-Lights of Nature in Quill and Crayon,* to which Edward Tickner Edwardes brought the quill, and George C. Haité the crayon, has just been issued by E. P. Dutton & Co. ($1). The authors are disciples of Gilbert White, of Selbourne, and bring both observation and fine poetic instinct to their work, which has more than ordinary charm.

....A glorified Deadwood Dick story of the old frontier centered round the loves of Sergeant "Brick" Haines and Molly McDonald, daughter of the commandant of a military post in Kansas, is written by Randall Parrish in his *Molly McDonald* (McClurg; $1.35). The period is that of the Indian wars of 1876, and among other episodes are a stage coach attack by Indians, an abduction, and a final rescue by General Custer

....Those who wish concrete information about industrial education as it has grown up in different cities of the United States should note *Examples of Industrial Education,* by Frank Mitchell Leavitt. The author analyzes economic and social elements of the general problem and gives an illuminating account of the growth of special types of industrial education, such as those of the trade school, the continuation school and the vocational high school, to meet special social needs in various American cities. The last chapter is devoted to agricultural education (Ginn; $1.25).

....A two years' course in English composition has been prepared by Charles Lane Hanson, of the Mechanic Arts High School in Boston (Ginn; 90 cents). The author has been successful in organizing fresh material for skilfully differentiated practical exercises. He has designed the book for the first two years of "any high school."

....Visitors to Edinburgh remember the monument erected on George IV Bridge to the devoted Skye terrier who lingered for twelve years by the grave of his master in Old Greyfriars, until at his death his body was laid in the same grave. The little dog has at last been made the hero of a novel by Eleanor Atkinson, *Greyfriars Bobby* (Harpers; $1.20).

....The fall list of the John Lane Company includes several volumes of translations of works by Anatole France: *The Aspirations of Jean Servien, The Opinions of Jerôme Coignard, My Friend's Book, Jocasta and the Famished Cat, At the Sign of the Reine Pédauque, On Life and Letters* (second series), and *The Gods are Thirsty*—"Les Dieux ont Soif"—the new novel of the French Revolution recently discussed here as *The Gods Thirst.*

....In *The Hamlet Problem and Its Solution* (Cincinnati: Stewart & Kidd; $1) Emerson Venable endeavors to read reason and harmony into the play by treating it as a psychological study. A much simpler explanation of the inconsistencies of Hamlet is that Shakespeare as usual picked up various fragments of old stories, some as old as the Vedas, and stuck them together, being at the time too busy or too careless to remove all traces of incongruity. But this is something Mr. Venable does not take into consideration.

....The life of William Pryor Letchworth, the founder of Craig Colony and of Letchworth Village, for epileptics, is issued by Houghton Mifflin & Co. ($2). Mr. Letchworth's devotion to public benevolence, especially in the forms of "child-saving," and of improved treatment of the insane and epileptic was life-long; and his philanthropy was inspired by those higher aims which are statesmanlike and scientific. More recently Mr.

Letchworth's name has become familiar thru his gift to the State of New York of his beautiful estate on the Genesee River, called "Glen Iris," to be maintained forever as a public park under the care of the American Scenic and Historic Preservation Society. The selection of Mr. J. N. Larned to be the author of this biography is a sufficient testimonial to its literary method and quality.

....*Our Baby,* by Ralph Oakley Clock (Appletons; $1.25), treats of that most important member of a normal family, in a plain, straightforward style, clear enough for the average mother to understand, yet from a modern scientific standpoint. The "qualifications of a nursemaid," given by Doctor Clock, suggest some things that the mother herself should be, and the desirability of her caring for her own baby as much as possible.

....Future biographers of the great Napoleon's elder brother will find material in the *Lettres d'Exil Inédites* of Joseph Bonaparte, edited by Hector Fleischmann, who has reproduced manuscripts in the possession of the Baron de Meneval (Paris: Charpentier et Fasquelle; 3 francs 50). These letters of the ex-King of Spain were written from the United States, England and Italy, 1825-1844. Their only interest will be for the biographer and the close student of political history, for they are singularly wanting in personality. The introduction and notes furnished by M. Fleischmann are admirably thoro.

....It has often been questioned whether it would be possible ever to add anything to our canonical Scriptures, and even those who regard the canon as theoretically open have answered that practically no change could ever be made. Now the investigations of Prof. C. C. Torrey have certainly resulted in restoring a half chapter or so which once belonged to the book of Ezra, but has been lost for centuries from all Western versions of the Bible, and there would seem to be no good reason why it should not be inserted in its rightful place. The lost portion fell out at the close of the first chapter, and it is needed there to throw light on the story that follows, and relieve the account of some difficulties if not absurdities which are inherent in the present reading. Prof. Torrey's entire volume of *Ezra Studies* is full of interesting material on the original arrangement, contents and historical character of the work of the Chronicler. These studies are examples of the highest type of scholarship and careful investigation, and it is not often that technical work secures such large practical results as are here found. (University of Chicago Press: $1.50.)

Pebbles

"Now they are trying to make the cactus edible."

"I don't think we need a vegetable shad."—*Washington Herald.*

"DID you get your shirt back from the laundry?"

"Yes, but not the front."—*New York American.*

"I HAD a queer experience last night. A mouse ran up my trousers leg, and"——

"Gee, didn't it scare you?"

"No; you see, my trousers were hanging on a chair."—*New York American.*

"SAY, dad, remember that story you told me about when you were expelled from college?"

"Yes."

"Well, I was just thinking, dad, how true it is that history repeats itself."—*New York World.*

THREE boys from Yale, Princeton and Harvard were in a room when a lady entered. The Yale boy asked languidly if some fellow ought not to give a chair to the lady; the Princeton boy slowly brought one, and the Harvard boy deliberately sat down in it.—*Life.*

THEY'RE WEARING 'EM THAT WAY.

Fair ladies sigh for liberty, protest against Man's sway,
And mutter that Male Tyranny will soon have had its day.
But where is she who would be free, nor further homage pay
At Fashion's shrine? I'd make her mine if she would never say:
"I know this hat is hideous, but they're wearing 'em this way!"

I'd not object should she omit to honor and obey,
If but my girl should have the wit to scorn that foolish "they."
But sleeves may wax and sleeves may wane, or basques come back to stay,
Stocks coincide with girdles wide—were arms not in the way—
Ere one shall find fair maids with mind to say Dame Fashion "Nay."

Hats may be flats, hats may be sharps, or something in between;
A deep small-gray may be au fait, or a real June bug green.
But where "They" lead 'twere vain to plead with Jane or Geraldine
To stay behind, so be resigned when she shall smile and say:
"It's aw'fly unbecoming, but 'They're wearing 'em this way.'"
"You wouldn't want me to look queer?"
"Of course not; no, indeed, my dear!"
They're Wearing 'em That Way.

—*M. Madison Lee, in New York Times.*

The Independent

Entered at New York Post Office as Second Class Matter
Publisher, Clarence W. Bowen
130 Fulton Street - - - - New York

A WEEKLY MAGAZINE FOUNDED IN 1848
One Year, $3.00 Single Copies, 10 Cents

Single copies over six months old, 25 cents. Postage to any foreign country in the Universal Postal Union, $1.75 a year extra; to Canada, $1.00 extra. Subscriptions will be received for other periodicals, and clubbing rates will be granted as low as those offered by any responsible agency.

An order for the change of an address should be received two weeks before the change is to take effect. The old as well as the new address should be given.

For the convenience of our subscribers we will send on receipt of the publisher's price any book reviewed or advertised in our columns.

Volumes of The Independent are completed at the end of December and June, and a full index is furnished free on application. Neat binders holding in book form thirteen current issues will be furnished for 45 cents.

If the numbers comprising any semi-annual volume are returned to us prepaid in good condition with $1.50 we will bind the volume in handsome and substantial half buckram and deliver it free anywhere in the United States.

We are always glad to receive articles for examination, but writers desiring the return of their manuscripts, if not accepted, should send a stamped and addressed envelope. Even so, we cannot hold ourselves responsible for their return. Authors should preserve copies of their manuscripts.

Advertising rates will be furnished on application.

Vermont's Election

THE first election by which could be measured the effect, at the polls, of the national nominations recently made by the old parties, and of Mr. Roosevelt's new party movement, was the one held on the 3d in Vermont. September elections of State officers there, in Presidential years, have been regarded as a kind of barometer. When the September Republican plurality has fallen below 25,000, the election of a Democratic President has followed in November. The Republican plurality was 31,559 in 1904 and 29,654 in 1908. In 1884 it was reduced to 22,704, and in 1892 it was only 19,702. This year there was a new party, in support of which Mr. Roosevelt and others made an aggressive and exciting campaign.

When the count was completed it was seen that the Republican party was divided; that the two factions had cast 42,059 votes; that this number showed a plurality, over the Democratic total, of 21,709; and that the Democratic vote had been increased. Comparison is made with the results of the election in September, 1908. The figures are given below:

	1908.	1912.
Republican	45,598	26,259
Roosevelt Progressive		15,800
Democratic	15,593	20,350
Prohibitionist	918	1,443
Socialist	547	1,181

The new party's votes were drawn from the Republican party. We can find no evidence that more than a very small number of Democrats yielded to the appeals and arguments of Mr. Roosevelt, ex-Senator Beveridge and other representatives of the new organization. In fact, it is admitted that substantially all of the 15,800 had been Republicans. The Democratic party suffered no loss, but its vote showed a gain of 4,397, or 27½ per cent., since 1908, and an addition of 16½ per cent. to its vote in 1910, which was 17,425. If all the Republicans had stood together, their plurality (21,709) would have fallen below the traditional limit of national safety. But their party was divided.

This division and the Democratic gain are the important and impressive features of the election. The new party's 15,800 votes were 37 per cent. of what may be called the Republican total. Mr. Roosevelt says that a considerable number of men told him they intended to support the Republican State ticket, but would vote for him in November. It should be said that opposition to Mr. Taft's reciprocity agreement with Canada moved some of those who did support that State ticket. Is there to be a similar division of the Republican party in other States at the national election in November, and, if so, how will that election be affected by it? Mr. Taft cannot afford to lose 37 per cent. of the normal Republican vote. It must be admitted that the result at the polls in Vermont indicates the election of Governor Wilson. The Democratic party is united. There was no perceptible Roosevelt defection in Vermont. We see no signs of any elsewhere. There is no indication that Mr. Roosevelt's recent attitude toward the negro will draw to him the votes of white Democrats in the South.

He must know that he himself cannot be elected. There are some of his followers sanguine enough to predict vic-

tory for him, but he and the politicians near him are not deceiving themselves about this. He can only expect or hope to cause the defeat of Mr. Taft. Is that his aim? He must know that the defeat of Mr. Taft by such a defection as may be measured or indicated by the result in Vermont would elect not only a Democratic President but also a Democratic Congress. He was saying in his public addresses last week that the abolition of tariff protection would be disastrous to our industries, that enforcement of the Democratic doctrine concerning the tariff would be ruinous. But his new party movement, as he must know, tends to give full power, executive and legislative, to the party that is committed to the policy which he denounces. He would have the great incorporated combinations supervised and regulated by a Federal Commission, but his new party movement is really in the interest of a party whose views as to the treatment of these combinations are sharply at variance with his. Among those who intend to desert their old party and to vote for the new party's nominees there must be many who realize that these nominees will not be elected, and that another party will be the beneficiary of their action. We are not saying, nor do we believe, that the election of Governor Wilson would be a calamity. His party showed wisdom in nominating so good a man. Our reasons for opposing the party have recently been exprest. But those Republicans who are intending to vote indirectly for the Governor and his party should know just what they are doing. We cannot see that there is anything to be gained, for the promotion of progressive projects or for the general welfare, by cutting the Republican party in two and causing an enduring bitterness in the relations of the severed parts.

The Origin of Life

BEWARE of the press agent! Many a good play and book has had its reception spoiled by advance notices arousing expectations which could not be fulfilled. Science is liable to the same misfortune as is shown by the popular disappointment in the presidential address at the Dundee meeting of the British Association for the Advancement of Science. It had been rumored that this address was to be of more than ordinary interest, for it would announce the discovery of proofs of spontaneous generation; and since the speaker, Prof. E. A. Schäfer, had for thirteen years occupied the chair of physiology at Edinburgh University, and was well known as the editor of the *Quarterly Journal of Experimental Physiology* and many books on histology and anatomy, such an announcement from him would receive more consideration than is ordinarily accorded to reports of abiogenesis.

But now that we have the text of the address, published in full in *Science* of September 6, we can see that it contains nothing new or startling. Professor Schäfer simply restates the argument for the mechanistic conception of life, doubtless for the purpose of counteracting the present drift of biology toward vitalism, that is, toward the view that the ordinary laws of physics and chemistry are not sufficient to explain all the processes of life, but that there is also in living beings some additional directing and co-ordinating force. Apart from this the address contains an interesting summary of the remarkable progress made recently in physiological chemistry, particularly the discovery that the insignificant looking glands of the human body, which surgeons were formerly inclined to regard as useless, because they did not see any use for them, are in reality of vital importance since they secrete and send out to all parts of the body chemical compounds of comparatively simple structure known as "hormones," which serve to stir into activity the various organs.

There is nothing sensational or irreligious in Professor Schäfer's belief that life originated in a gradual transformation of inorganic into organic matter and this into organized living beings. The only alternative hypothesis to this which has been brought forward is the one advocated by Kelvin and Arrhenius, that the germs of life might have been brought from some other planet in meteorites or floating free in space and propelled by radiant energy. This is apparently not impossible, but it seems a very violent assumption, much harder of acceptance than the other, that of abio-

genesis. For the wall between the organic and the inorganic has been broken down completely and that between the living and non-living is being tunneled into from both sides. On the one hand we have been able to construct artificially such complex organic molecules as sugar and protein. On the other hand, it has been found possible to produce in silicious and metallic solutions mimic cells which grow, move, put forth pseudopodia, select their food, propagate by fission, and assume many of the characteristic forms of vegetable and animal life.

But while we are not able to disprove Professor Schäfer's theory that transformations of non-living into living material may be taking place at the present time, there is absolutely no experimental evidence that such is the case, and the gap between the most complex synthetic molecules and the simplest living protoplasm is so great that we cannot even imagine how it may be bridged.

As was pointed out in the article on Haeckel, printed in THE INDEPENDENT of August 22, a belief in spontaneous generation was until the latter part of the nineteenth century regarded as quite compatible with the Christian faith, indeed as so far forming a part of it that one who disbelieved it might be prosecuted as a heretic. In discussing the presidential address, Sir Oliver Lodge, who is not only an eminent physicist, but a pronounced spiritist, did not question the possibility of producing living material in the laboratory, altho he thought that even then the real nature of what we know as vitality would still elude us. Bishop Welldon, former Headmaster of Harrow, said:

> "There is nothing in Professor Schäfer's address which ought to excite the slightest opposition or uneasiness to the mind of any Christian."

But he also says in somewhat peculiar language:

> "I am afraid the key to the great problem still remains and is likely to remain in the hands of Providence."

Judging from this remark we are "afraid" that Bishop Welldon is one of those theologians who see the hand of God only in what is inexplicable by natural law. This is a dangerous doctrine, quite too much like the identification of the Deity with Spencer's Unknowable. It is the faith of the Christian that God is not altogether unknowable and that knowledge of his nature and purposes is revealed to us by the study of science as well as by other means.

The Progressive Party in New York

SHREWDNESS is good, but luck is sometimes better. The cackling of a goose saved Rome, as ex-Policeman "Suspender Jack" McGee told the Progressive party convention in Syracuse last Friday, and he saved the party from initial disruption by nominating, after the nominations had been closed and they were about to begin voting, Oscar S. Straus for Governor. The two candidates previously named, both worthy men, had such persistent supporters that a factional fight was on, and the disappointed ones were likely to leave disgruntled; when, like a bull moose in a hickory copse, in rushed Jack McGee and, amid laughter at his odd appearance, which changed speedily to wild cheers, he nominated for Governor Oscar S. Straus, the presiding officer of the convention. It was a stroke of genius, or of unconscious instinct wiser than wisdom. The shrewd leaders, with Mr. Roosevelt, shrewdest of the shrewd and more versed in political wisdom, had agreed on Controller Prendergast, the best candidate they could think of, and then this ignorant butter-in antlered his way thru and across their wisest schemes and beat them all to a frazzle. So our much-honored Oscar S. Straus was nominated by acclamation, without one negative, and "Suspender Jack" won the day. We have not seen a more spectacular scene since at St. Malo on the Rance Hervé Riel, before Admiral Dumfreville and all his officers

> "out stept, instruck amid all these
> —A captain? a lieutenant? a mate—first, second, third?
> No such man of mark and meet
> With his betters to compete!
> But a simple Breton sailor, prest by Tourville for the fleet,
> A poor coasting pilot he, Hervé Riel the Croisickese,"

but who saved the fleet from capture. So give honor, if not verse, to "Suspender Jack," the policeman.

The nomination is an admirable one. No one can say a word against Oscar S. Straus. He was in Roosevelt's Cabinet. He was twice Ambassador to Turkey when special diplomacy was required. He is a Jew by birth and faith, and yet, when nominated by an amusing and unconscious irony, the convention burst into singing "Onward, Christian Soldiers, Marching as to War, With the Cross of Jesus, Going on Before." Mr. Straus will not soon hear the last of that from those of his faith. And yet he was familiar with the tune and words, for he learned his letters in a Baptist Sunday school in Georgia. He is and has been an independent in politics, having been both a Republican and a Democrat in his career, without losing any one's respect. He will have a strong Hebrew support, and his interest in labor will stand him in good stead among artisans.

We have no word against the platform, except in its call for the repeal of the Reciprocity Act. It shows how much can be done in the way of reform by legislation without amending the Constitution. We do not need so much easy and speedy tinkering with constitutions as we do the use of the methods of amendment we already have. There is no better way than that of Ohio, by which at a fixt term, say twenty years, a constitutional convention is automatically called to formulate amendments to be submitted to the people. This platform calls for a constitutional convention and this is certainly needed for the State. We advise all coming State conventions, of whatever party, studiously to peruse the platform adopted by this Roosevelt convention, for its reforms are generally non-partisan, and can be adopted by any party. Tho it is silent on the tariff, it is exceedingly broad. It gathers in the reforms needed and is a great credit to its constructors. We venture to give special credit for it to Prof. Samuel McCune Lindsay, also to Prof. George W. Kirchwey, dean of the Columbia University Law School, who was nominated as one of the two Judges of the Court of Appeals. We cannot here individually discuss the half hundred and more planks in the platform, but among those less generally discussed than the initiative, referendum and recall we mention that for a permanent bureau to draft legislation and publish recommendations in advance of the meeting of the Legislature. We also observe that it does what we blamed the Progressive national convention for not doing—urges enforcement by letter and spirit of the State laws against discrimination because of color or race. It also pledges its candidates in favor of woman suffrage. Its treatment of the immigrant problems is courteous, if not very definite. It is strong on all labor and industrial questions, but not in any way obstreperous. We also seem to observe the influence of clear legal judgment in questions that relate to legal procedure, in which reforms are much needed, as all jurists admit.

We shall now learn what pointers Maine, following Vermont, has to give us in the coming Presidential election. But it is the great States, and particularly New York, that are to decide in November. The Progressive movement is strong enough to split, if not shatter, the Republican party; and is fitted, if not designed, to make Democratic success sure.

English Land and English Folk

THE Hon. Francis Neilson, member of Parliament and president of the English League for the Taxation of Land Values, is responsible for the statement that, contrary to reports circulated in America, the new English Insurance Act is working marvelously well. He regards it, however, not as a solution of any social problem, but merely as a temporary expedient, a palliative for an evil condition until radical remedies can be applied. This is the view of it held also by its author, Lloyd George, who, we are assured, hopes to associate his name with more thorogoing measures.

Mr. Neilson is better known in this country as an actor and playwright than as a statesmen. He is, however, a serious-minded man, whose views of human life are by no means revealed in "A Butterfly on the Wheel." He came of hum-

ble English folk, and at the age of nineteen began to make his own way in the world as a clerk in the Washington Market in this city, and he has never lost his sympathetic touch with the people. Now, as a man who has arrived, he is throwing himself with enthusiasm and earnestness into a struggle which he believes is nothing less than a social revolution, altho, happily, a quiet and bloodless one.

The opinion of such a man upon the social-industrial situation in Western civilization is worth more than that of a hundred mere onlookers, and it is safe to take seriously Mr. Neilson's prediction that the vast resources of English land will within a comparatively few years be made available for the amelioration of the economic condition of the masses of the English people.

The program of the League for the Taxation of Land Values is essentially that which Henry George set forth in "Progress and Poverty." It is based on the assumption that the Ricardian law of rent is a true account of the relation of land values to all other values, and to the sum total of business enterprise. A tax on the rental value of land is not added to the prices that consumers have to pay for commodities. On the contrary, the prices paid for the produce or the use of land determine its rental value. A tax on rental value, therefore, merely compels the owner to improve and utilize land up to its full economic value, instead of holding it apart from use for speculation or merely sentimental reasons.

England has thousands of idle acres of rich agricultural lands that would be brought under a high state of cultivation if they were taxed according to their true economic value. English local communities bear heavy burdens of education, poor relief, police and roads which could be enormously reduced if the land values of London were made to pay their due share into the revenues of the kingdom. London itself has fabulous business opportunities which remain unexploited because the land on which they might be developed is withheld from improvement and escapes taxation.

From our American viewpoint the specific demands of the League look innocent enough. They include the propositions that land valuations be made public, and that by taxation they be made available for public needs, including roads, police, poor relief and education. Actually, however, American real estate taxation does not in the least conform to the "rental value" principle. Improvements are confounded with true land values, and our taxes often fall on the improvements rather than on the true land value. And not much headway is being made in the United States toward an actual adoption of what may be called the Georgian idea. But in Canada, at Vancouver and in Edmonton, it is being tried, with apparent success. It seems probable, therefore, that in England, the home of ancient landlordism. this radical plan for a general betterment of economic conditions will have its first trial on a national scale.

England has sometimes seemed to be distrustful of herself in recent years, but she has not yet failed to hold her own among the leaders of practical progress.

The Episcopalian Search for Fellowship

THE new effort begun in the Episcopal Church in this country looking to, or at least hoping for, more fellowship with Christians of other denominations is of sufficient importance to deserve careful attention. It began in a commission, appointed by the last Episcopal General Convention, designed to call a World's Conference on Faith and Order. It was sufficiently financed by Mr. J. P. Morgan, and is presided over by Bishop Andersen, of Chicago, with whom, on the commission, are eight other bishops, nine clergymen of distinction and seven leading laymen. They represent various schools in the Episcopal Church and form an imposing body of men.

Their work began quietly in calling parlor conferences, each with ten or a dozen representatives of some one of our leading denominations. There was frank talk with these representatives severally, and in each case they were asked to formulate the terms on which they could agree as to faith and order. To the members of the commission the conclusions seemed hopeful enough to make it worth while to go further.

The next step took them to Great Britain to consult with their Anglican brethren. The deputation consisted of the Bishops of Chicago, Southern Ohio and Vermont, with the Rev. Dr. Manning, of Trinity Church, New York. It was desirable to know if the Anglican Church would unite with the American Protestant Episcopal Church in calling such a World Conference on Faith and Order. They were most cordially received by the archbishops and bishops of England, Scotland and Ireland, and their concurrence was assured. Action will be formally taken at the subsequent meetings of the several Houses of Bishops of England, Scotland and Ireland; and also the Archbishop of Capetown, whom they met in England, will present the matter in his province.

The next step will be as follows: The Archbishops of Canterbury and York will appoint a commission to stimulate interest in the coming conference. It is proposed that these "invitations to the various religious bodies in England to take part in bringing about and conducting the conference be extended to them by their coreligionists in America." By "coreligionists" is plainly meant co-denominationalists, for we are all of the same Christian religion. This method of invitation is courteously meant, so that the Church of England might not seem thus to assume the primacy over the other "religious bodies." The Church of England committee will then "markedly hold itself in readiness to confer" with such committees of the other bodies, as well as with possible representatives of the Roman and Eastern Churches. It is the desire of the Anglican conferees that the American origin of the proposed Conference on Faith and Order be emphasized, and that the conference should be held in this country.

The spirit and purpose of this movement deserve warm support. It is proper that it should be a movement from within the Episcopal Church. It is that Church that feels the difficulty of the problem involved. The Roman Church feels no difficulty, for it wants no ecclesiastical fellowship with the rest of us. It and it only is the true Church. It has categorically decided that the Anglican Church, so called, has not the true orders and is not a true Church. Much less are non-Episcopalian denominations true Churches. Equally, the non-Episcopal Churches have no problem of fellowship; they have already formed their federations in this country and in Great Britain. It is the Episcopal Church which remains outside, simply because its members cannot agree. Some are High Church, denying the valid Church orders in the sects, and others are Broad Church and care less for the question of orders and forms than they do for fellowship in faith and service. They would be ready now to federate if it were not for the fear of a schism in their own body. And the High Churchmen do not like their position, and they would like to see if some modified form of fellowship, some minor recognition, could not be contrived that would not leave their Church outside wholly of the circle of recognized fellowship. This is an educative process, a step in advance, which may be thought to bring the denominations nearer to the Episcopal Church, or that Church nearer to the denominations.

In another way the movement deserves full sympathy. Hitherto the efforts for unity in the Anglican Church and in the sister American Church have been mainly directed to the Roman and Eastern Churches, while the nearer Protestant Churches have been treated as negligible bodies. That is, they have sought union where union was hopeless, and have not sought it where it was sure to be welcomed. When the Federation of Churches was organized in this country invitations were sent to the Episcopal General Convention, but no attention was paid to them then or since, altho excellent churchmen have personally taken actual and useful part. It would now appear that Anglicans and American Episcopalians are about ready to give up the hopeless endeavor to organize a union with Rome, if not with the Greek Church, and are ready to consider union with their nearer brethren, an attitude greatly to be rejoiced in.

Beyond question, discussions about faith and order can reach no final agreement. It is not desirable that we should agree. Discussions may bring out and provoke differences. We must agree to

differ and yet agree. The conferences will do much good, much more than the defining of differences. We want union, union in service rather than in faith and order, which means creed and government. Already episcopally governed and non-episcopally governed Churches are in the Federation of Churches. The way to unite is open and easy, if one wants to. If some less definite way of union can be devised for those who cannot join in the present form of federation, it is greatly to be hoped that this Commission on Faith and Order will find it out. To stand outside is lonesome.

Pockets

A POCKET is a poem, and a sensible boy knows it. He is incomplete without it, and without a plenty of them. We do not refer to the boy that crams his pockets in a disorderly way. There are such boys, but not so many as we are liable to suppose. Pockets teach order, system, rhythm. The boy with seven pockets learns to sort things, to keep things in their places—having a place for everything.

Here is how it works; number one is knife pocket. A boy who has no knife, no good and handsome and strong knife, is to be pitied. You cannot make a man out of such a boy. A knife is quite as important as a spelling book, and twice as useful as a grammar. We do not mean for whittling, but for learning to achieve. It is the best part of education. Better a two dollar knife than a one dollar knife, and either one of them is better than a five dollar dictionary. As for spelling, is not *nife* just as good as *knife;* but when it comes to doing that is another thing, and the knife will teach it.

As for pocket number two it is for strings, and a small box of fish hooks, and a bait box, which needs occasional looking after by the boy's sister. Pocket number three is for specimens—that is, for things discovered in this world as the boy goes around to find it out. These specimens also need a few tin boxes, especially if they be bugs and beetles. Pocket number four is for apples, and, out of apple time, for pears or nuts. It will sometimes catch plums or grapes or gooseberries, but that is not to be encouraged, for a boy cannot be all the time remembering. He may sit down on a pocket.

Number five is for his handkerchief, and number six for his purse, leaving only number seven for a furious miscellany. This cannot be helped, not in a world that relies so much as ours on buttons and hooks—an unfinished world, where folks start as boys and girls, instead of ripe old men and women. A boy sometimes needs a shingle nail where a button comes off, and a good for something boy is sure to be known by some sort of favorite tool—a preliminary announcement of what he is to be and to do when grown. Now, do you let him alone. Do not empty his pockets and mix their contents. Do not undertake to put his things in order. Honor the man that is to be.

Of all the prosaic follies perpetrated by women the least excusable was abolishing pockets, and lots of them. Woman's dress is so admirably suited to sly concealment, it should be full of pockets, and every pocket also have its purpose. Thread and needles and thimbles in one; knife and scissors in another; pocketbook in a third, and watch in a fourth. Bills due and a small checkbook should fit nicely in a fifth. But a memoranda pocket, with pencil attached, should invariably occupy the sixth.

This memoranda pocket is the only common and universally essential pocket. Everybody should have one—men, women and boys and girls. We have been overtaxing the memory. Even if you try you cannot remember one-half the item duties of a day. But why try? It wears out the nerves and tires out the brain. Set down these items every morning and every night; label this book My Memory, or My Second Memory, and put it in your pocket.

Some people need special pockets; the banker for papers; the merchant for samples, and the scholar for books. We have a friend who insists that there is nothing so important as to have in the pocket a two-foot rule and another insists on a fifty-foot reel. These are made to fit very nicely and stow away very compactly. About one-third of our rising generation is given to mechanics, and for all these is wanted the mechanic's pocket.

Without tools, and the very best that have been invented, these people are as badly off as a more brute force generation without revolvers. Here, indeed, is a charming illustration of human progress.

Law has forbidden the carrying of firearms, but the old revolver pocket is now supplied with screwdriver and pocket wrench and pruning knife, all significant of progressive civilization. No one takes a vacation without a pocket Kodak, or goes into the land of lakes and woods without a pocket compass. The lunch basket has become the lunch pocket; only in place of roast chicken it carries Caracas chocolate and a can of tunnyfish; concentrated food for a two days' tramp in a single pocket.

Old men, above all, need pockets. There is nothing in life to compare with one's October. It is then that the *memoriter* of a long life has accumulated; a photograph or two dating back half a hundred years; bits from boyhood and samples from manhood; and, like any other boy, there's a pocket always to be supplied with apples and grapes. The old man is in his second childhood, and is not ashamed of it. He has a whole life behind him, and he does not mean to let go of it. He is just as happy now as when he was ten years of age, and was gathering his earliest discoveries in the botanical field or pocketing now and then a geological specimen.

Every age is notable for some peculiar storages. 1800 had its bandboxes, fragile and troublesome. 1900 concentrated its skill on suit cases, evolving all the time toward compactness. 1950 will be notable for the crowning virtue of having everything at hand. An ideal pocket system is the problem of the day. It must be invented; a system of least wasted room and the most useful material.

Express Rates

The Interstate Commerce Commission examined and compared six hundred thousand different express rates, and waybills and receipts quite as numerous. They report that the express business is divided between thirteen companies, none of which own railroads or cars. Contracts with the railroads compel the express companies to levy rates at least twice the tariff of the railway freight rates, and then one-half at least of this sum must be turned over to the roads. Here is a two-headed corporation at the outset. The commission found that the shipping system made it very difficult for a local agent to determine what should be charged on any package. To prevent overcharging by charging at each end of the route, the commission orders colored labels on each package, which at a glance will determine the question. It is hereafter forbidden to take packages by long routes and charge for the distance carried. It seems that the custom has been to carry a package by a roundabout way, at an exorbitant charge, giving a fee to each of two or three companies, and then deliver it without any remedy. The package must go hereafter by the most direct route. Another matter of no small moment is the provision that hereafter a package may not lie undelivered in an express office, without any effort to find out the owner. As to rates, the commission orders a great reduction. The present rate on a package weighing 10 pounds, and going from New York to Boston, has been 40 cents; this will be reduced to 28 cents. Local rates within 5 or 50 miles will be reduced 30 per cent. on all small packages. The new rules are especially adjusted to allow the transit of small packages.

Farm Immigrants

Seventy-five years ago, when the Irish began to come over, they took very readily to farming, and for a time they were buying up what the New England boys were getting tired of, on their way westward. They have proved to be too good imitators, and very soon fell into the tide factoryward and cityward, altho there are hosts of first-class Irish farmers still to be found. Then came the Germans, who mainly took up truck farming around our big cities and made a grand success of it. The Swedes and Hollanders and others created new States or counties at least. Clannish a little, but what would Wisconsin and Iowa and Michigan be today but for these colonial settlements? The Welsh went mainly into central New York, and

they created some of the finest farms in America, and they hold them yet tenaciously. Recently the Jew, with all his herding traditions behind him, looked more graciously on farming, and as a colonist has succeeded admirably. Probably most of the prejudice against our newer immigrants has come from their so readily falling into the city crowd, and adding very little to the productive energy of the country. It is said that now there is a very decided impulse stirring among these people to become farmers. It is a wholesome movement, to be fostered by all means. The Italian is a natural gardener, and, like the German, he can grow a large amount from a small area. Ours is the age of intensive farming, and we have got to learn how to make two beets or two turnips grow where one grew before. The Italian can do it. We welcome him back to the soil, and we are sure that he will make a much better citizen than when buried in the slums of our cities. The problem of high prices, THE INDEPENDENT has insisted from the outset, depends mainly on the decrease of production in proportion to the increase of population. What we need now is to get to work, under the general supervision of our agricultural colleges, and enable our land to do what Nature intended it should, to feed well any possible increase of population up to five or six hundred millions. The American soil can do it when scientifically tilled by labor lovers.

The Humble Potato

Rubber from potatoes! What next will that little, underground tuber teach us? Sixty years ago the great French chemist, Pasteur, said: "Where will you find a man whose curiosity and interest will not immediately be awakened when you put into his hands a potato?" and it is particularly fitting that a representative of the Pasteur Institute of Paris, Professor Fernbach, should be one of the group of investigators who in early July of this year accidentally stumbled on the last step in the formation of synthetic rubber, as we explained in our issue of July 11. Already the potato in the form of alcohol enters abundantly into our everyday life. The beds we sleep on, the shoes we wear, the cars and carriages we travel in, the fireworks we enjoy, the pipes we smoke, the umbrella and the stiff hat or the straw hat it protects, are all made possible by the shellac of which alcohol is an important part. Even the gas fixtures, the musical instruments and the watch are dependent on alcoholic lacquers. The combs we use, the piano keys we finger in our leisure and the billiard balls with which we while away our time are commonly made of celluloid, a material made possible only by alcohol, the product of the potato. What would we do but for the yeast from potatoes with which our bread is raised, and the starch and vinegar which enter into household life so extensively! And chemically in smokeless powder, in explosive caps for cartridges, in anesthetics, in embalming fluids, and even in the varnish on our coffin, the products of the potato surely follow us to the grave.

Lowering the Price of Coal

To burn the coal as it lies buried in the ground seems at first sight to be only another way of decreasing the supply and of forcing the price higher, yet it has been seriously proposed by Nicola Tesla. His assertion is that the gases formed by the combustion of the coal may be led to a power house and there used to run gas engines, which may in turn operate electric generators. In this way the cost of mining the coal is avoided and the power is more easily and cheaply transmitted to a distance as electricity than it is transported in the form of coal. Within a few days other inventors, Mr. J. H. Hoardley and Mr. W. H. Knight, have made public another and, perhaps, more practical method of mining and transporting coal, which is designed to lower the cost to the consumer as well as to lessen the danger of mine explosions. With their apparatus in use, a heavy stream of water is played on the coal to be mined and at the same time a rotary cutter eats in and grinds the coal to a powder, which is swept away by the water into a catch basin or well. From there the liquid mixture is pumped thru pipe lines to the place where the fuel is desired, and at that point the coal dust is dried out and burned. It is claimed, after a practical

test, that the water keeps down the poisonous gases and inflammable dust in the mines, and that the cost both of mining and transporting is lower than at present. It appears that the public might gain at both ends if the water is squeezed out of the stock and put into the mines.

Training for Parish Workers

All the theological seminaries of importance have found out of late that they had not only to train men to be pastors of churches, but also men and women to be parish workers, whether in the Sunday school or as visitors and missionaries. We have received the announcement by Union Theological Seminary of its new department offering a special course for parish workers. It is called the New York School of Philanthropy, and has for its director Prof. Edward T. Devine, who is professor of social economy in Columbia University; and he is assisted by five other teachers who cover the departments of Family Rehabilitation, Child Welfare, Neighborhood Activities, Social Forces, etc. These are in addition to the more definitely religious or theological departments offered by the regular professors of the university. In our large churches the single pastor cannot do everything. He must be supplemented.

Two Ways for Woman's Suffrage

The American way to secure suffrage for women is by the patient appeal to reason. It is a slow way, but the only sure way. Its advocates have been at work at it for two generations, and they have gained fair success, full suffrage for women in six far Western States, California, Washington, Colorado, Utah, Idaho and Wyoming; and suffrage amendments will this fall be voted on in Michigan, Kansas, Oregon, Wisconsin and Arizona, with a fair prospect of success. Eastward the star of woman's empire holds its way. The Roosevelt national convention endorsed woman's suffrage, and various Republican State conventions have done the same. As never before women will be speakers in the coming campaign. There is every appearance that in a dozen years half our States will give votes to women. The method used to gain these results has been purely that of reason, the women trusting to the good will of their husbands and brothers to do them justice. This is the American way. The English way is to break up meetings with screams of "Votes for women," to smash windows, to stone members of the cabinet, to set fire to theaters, and generally to do mischief and be a nuisance. It has gained not one particle of success. At best it has sent dozens of women to prison for short terms, and the last exploit at Dublin has sentenced two women to five years at hard labor. Those who say that women lack logic can find support in the Englishwomen's notion that there is a relation between hammering windows and depositing a ballot. American women have shown that they are not lacking in reason and logic.

James J. Hill's Advice

It is a magnificent stride toward fair prices for food, and a plenty to go around, when agricultural experts are placed in charge of the whole farming proposition in the United States. James J. Hill, who has proved himself a prophet, tells us that the time has come to supplement schools and colleges to which the farmers may go with a collegiate work that goes direct to the farmers. He endorses the movement to establish in every county in the United States a model farm, where instruction in new methods and object lessons can be found by all the farmers of the section. This sort of school should cover orcharding, dairying, trucking, and all of them in a modest and model way. It should not be a theoretical performance, but a plain practical achievement of the very best achievement in horticulture and agriculture. Mr. Hill has established a sysem of five-acre tracts all along the Great Northern Railroad, where the owner is paid for his labor and is given the crops on condition that his tillage conforms exactly to orders. These orders will emanate from the ablest experts that our agricultural college system has yet been able to produce. These farms will be a connected series of high schools. Mr. Hill thinks that he will be able at the same time to simplify farm work and greatly increase the product per acre, while everything is done with

the least labor cost. He thinks that the farm does not now, as a rule, come anywhere near that simplicity of work and escape from toil that it might. Our agricultural college farms are showing the way, but at a distance. The Belgian system has increased the average field of wheat fourteen bushels per acre. Professor Bailey will tell you that this is scarcely a beginning. We have already demonstrated by these model farms and competitive tests that the corn crop of the country can be raised from fourteen bushels per acre to three or four times that amount.

Trails

Stevenson wrote eloquently in praise of the road and "the lithe contortions with which it adapts itself to the interchanges of level and slope." There is, however, more than one kind of walking. Road walking, such as the essayist celebrated, has its place in sophisticated society. But the walker of forest trails despises this ready-made kind of travel. Give us a path under the pines, the soil carpeted with the needles that have fallen for so many years that they urge the feet onward—each step an invitation to another. Rapid and springy, those steps, and the air is perfumed with the tonic of the pine lands. To walk an Indian trail thru the Maine woods is to taste pleasure that mere mortal never really deserved.

Language Studies

A rapid decline in the popularity of German studies has been remarked, in Great Britain, for at least ten years. French gains on German as a school subject; and doubtless the Anglo-French *entente,* the Anglo-German misunderstandings have contributed to this tendency. In Germany, according to the *Mercure de France,* French has as large a lead over English as it has in England over German. But this state of things cannot continue, for the Government recognizes the commercial importance of English, and exerts pressure to favor its diffusion. In France, up to the war of 1870, English was the preponderating foreign language. German then forged ahead. But since 1902 Italian and Spanish have assumed great importance on the French program, especially in the south of France. French, meanwhile, remains a favorite subject of instruction in Italy and Spain, English and German following in order of popularity. For South America, the *Mercure's* information is incomplete. However, in Chile, at least, French is obligatory, English and German optional. Can you decide from these data what will be the "universal language"?

The Stealing of Electors

We have the following note from James Schouler, LL. D.:

In my article on "Our Presidential Electors," published in your magazine of August 29th, I made reference to the conspiracy in Oregon, under a Democratic governor, during the Hayes-Tilden electoral contest of 1876-77, to have one of the three electoral votes of the State cast for Tilden and so make his election sure, notwithstanding the people had pronounced for Hayes at the November polls.

Not having old newspaper files here for reference, I relied upon my recollection of the incident and gave the impression that all three of the Hayes electors were not steadfast. It now appears that they were, and that the scheme consisted in the governor's refusal to give a certificate to one of these electors, who was a postmaster and hence ineligible under the Constitution. A Democratic elector, receiving the certificate in his place, undertook to cast the Tilden ballot.

In either case my inference holds its point—that in these days any scheme in a State electoral college to cast a vote contrary to the plain preference of the State voters, as exprest at the November election, is likely to fail in the electoral count in Washington, if thereby the Presidential result for the whole Union would be reversed.

War in the Balkans

When a country is in trouble is just the the time to make it more trouble. Italy has made war against Turkey, and Macedonia takes advantage of the opportunity to rebel. The misgovernment of Macedonia by the Turkish officials is part of the occasion, but also the Christian inhabitants are glad to take advantage of it to seek independence of Moslem rule. Now we have rumors that Bulgaria, Servia, Rumania may unite with Greece to force Turkey to grant to the rest of European Turkey the autonomy which they enjoy. These little principalities are weak enough singly, but if they could be united in one federation they would make a very strong nation. They have made great progress during the last thirty years, and backward Macedonia feels the

impulse which they have engendered. Greece was greatly humiliated by her defeat in her war with Turkey and her loss of territory, and would be very glad to be the heir to some part of the land which would be lost by the demise of Turkish sovereignty. Macedonia is inhabited by Greeks and Bulgarians, none too friendly with each other, and a union of Bulgaria with Greece in a war for the liberation of Macedonia might heal the breach between them. The perplexing Eastern question centers about European Turkey; and despite all our sympathy with the new Turkish regime the pushing of Turkey back into Asia would greatly relieve the chancelleries of Europe, beside the benefit it would be to the liberated provinces.

Fortunes differ. When Harry Thaw was imprisoned with the criminally insane after his murder of Stanford White, it was anticipated by many that he would be released within a year; but the years have past by, and abundant money has not been able to prove that he has gotten over his homicidal insanity. But the case with Charles W. Morse is a different one. Hardly had he been sentenced for one of the worst swindles in our history before he lost his health, and soon the doctors declared that he had an incurable disease and could not live six months. Out of mercy the President pardoned him, tho it is not clear why a prison is not a suitable place to die in, and he went to Europe to rest and recover. Within six months he is back in Wall Street, his incurable disease cured, he says, and ready to work to recover his fortune. The scales of justice do not always hang even; perhaps are tinkered with.

Monsignor R. H. Benson, son of the late Archbishop of Canterbury, who left his father's Church to join the Catholic Church, discusses Catholicism as a world religion in the *North American Review*, and makes the statement that Catholicism "is probably, with all its supposed intransigence and obscurantism, by far the most effective spiritual agency in the United States," and "is also making, in spite of its Western history, a progress in Oriental lands to which the detached and broad-minded Protestant aspires in vain." We suspect that neither statement will be generally accepted. Spiritual activity may be measured by the gifts in men and money for missionary work at home and abroad; and we do not observe the Protestant inferiority. As to Oriental lands it is interesting to note that the Christians in the Japanese Parliament have mostly been Protestants; and that the first President and first Vice-President of the Chinese Republic were Protestant Christians. Yet it is true that in both China and India the converts to the Catholic Church still largely outnumber those in the Protestant Churches, while in this country Catholicism is much stronger than any single Protestant denomination.

Within modern times civilization has utterly destroyed, annihilated forever, forms of valuable life which it can never reproduce. One of the last is the passenger pigeon, whose countless flocks used to break down the branches in the forests. Not one is known to exist now. Among larger birds it is enough to mention the dodo of Mauritius and the great auk of our shores. Among quadrupeds there are the gnu, and we had almost lost the forest bison, when a single small herd has been discovered in the Hudson Bay country by the explorer Harry V. Radford. The Canadian Government should see to it that they are not exterminated, but maintained in a Government park, as the European bison is carefully fostered in a park in Silesia, and our prairie bison is preserved with us.

Under a late Papal decision, civil suits must not be brought against ecclesiastics; but this does not seem to prevent a civil suit by an ecclesiastic. Bishop McFaul, of Trenton, N. J., has brought suit against a sisterhood in his diocese which refuses to make account to him of its collections and property, and to deliver the property over to him as the "corporation sole" representing the diocese. This is a smaller case of the difficulty which troubles the diocese presided over by the Bishop of Portland, where the Canadian Catholics demand thru the legislature the right to own the churches they have paid for, and complain when the bishop raises money by mortgages on them.

Insurance

Structural Engineering in New York

STUDENTS of the fire insurance business as it is conducted under the physical conditions prevailing in the United States, having in mind the unusual experiences encountered in Chicago and Boston about forty years ago, in Baltimore eight years ago and in San Francisco in 1906—fires in which the values destroyed easily equaled a billion dollars and precipitated the failure of more than a hundred insurance companies — have not failed to speculate on the probable extent of the ruin which would follow in the wake of any considerable conflagration occurring on the southern end of Manhattan Island.

True, the physical conditions in the district indicated slowly improve year by year as the result of the multiplication of fireproof and slow-burning structures; but, in the mass, as compared with the old type of buildings, the fire-resisting class remains decidedly insignificant. The rapid destruction of the Equitable Building last January, a structure believed in its day to be a substantial retardent to the sweep of fire, illustrates what would happen to the best of the older type.

In an address delivered before the International Congress of Testing Engineers last week, Richard L. Humphrey, of Philadelphia, a noted structural engineer, declared that New York was ripe for a fire which might result in the loss of hundreds of lives and property aggregating a half billion of dollars. He severely criticised the building code planned for this city, and boldly asserted that politics had operated to defeat the enactment of a set of building laws essential to its safety. "I make the solemn charge," he said, "that politics has interfered with the security of the people of New York, and that today, as a result, the citizen who pays his taxes, who has money invested here, is not getting the protection from dangerous conditions to which he is entitled." He informed his hearers that when the proposition was made for an improved building code for this city the world expected it would be a model for all other cities, and that altho the engineers interested in the matter did all they could to bring about that result, and that while the code as formulated is a step forward, it falls short of the requirements. "New York's code is not a model," is his verdict.

It is difficult for one who knows New York to imagine a combination of circumstances which would here duplicate the experiences which San Francisco suffered in April, 1906. And yet it must be admitted that (excepting the seismic disturbances) something approaching them are not wholly impossible. We have many buildings in the lower section of the congested district that would long withstand the assaults of fire, even in a gale of wind, and which would act as an impeding wall to the advance of the flames; but the way to a destructive conflagration is not by any means obstructed. There is one tremendous fact involved in this matter. Billions of value lie in the section between the Battery and Fourteenth street. A conflagration that would sweep that territory would probably destroy all the fire insurance companies doing business in the State, ruin thousands of citizens, and perhaps cripple the nation.

Politics should not be permitted to deprive us of the best building code that science can devise.

THE engineers of the National Board of Fire Underwriters, after an investigation of the physical conditions prevailing at Ogdensburg, N. Y., criticise the construction in the mercantile district, the fire department and the water supply. They pronounce the conflagration hazard as great.

YOUNGSTOWN, Ohio, has been examined by the engineers of the National Board, who report the buildings in the manufacturing district to be generally slow burning and well protected. Also that a general conflagration there is improbable owing to wide intersecting streets and a public square.

Financial

A Sale of Steel Rails

In the city of Manchester, England, last week, the Council, by a large majority, awarded a contract for steel rails (to be used on the street railways) to a Pennsylvania company which had submitted the lowest bid. This bid was £10,231, or £807 less than that of the nearest competitor, a Sheffield company. Replying to those who argued that home industries should be supported, the majority members said that they would not throw away the ratepayers' money.

When such products are sold in England in competition with the similar products of English mills, the sale tends to prove that the American manufacturer needs no protective duty to defend him here against the sale of English or other foreign rails. If he can overcome the competition of the foreign maker in the latter's home market, he can more easily overcome such competition here, without tariff protection, for the exporting foreigner is handicapped by ocean freight charges. We presume, however, that these rails were sold at a price lower than the price which Americans would be required to pay for them. If so, this is unjust discrimination in favor of foreigners and against the American people, who have given and maintained the tariff protection. For many years the combination price of steel rails (for steam railways) has been in this country $28 per ton at the mill. When the late John W. Gates, then president of a Western steel company, was urged to explain why he sold rails to foreign buyers for $18 or $19, he replied that he did it to keep his mills going. But when he was asked whether he could not as well keep them going by selling rails at $18 or $19 to American buyers, who would gladly take them at such a price, he had nothing to say.

Express and Parcels Post

The express companies and their stockholders are interested in the probable effect of the new parcels post upon their business. On January 1 the parcels post, it is expected, will be in operation. By some who have studied the situation the opinion is exprest that the Government (or parcels post) will monopolize the business in small packages, up to 5 or 6 pounds in weight, owing to lower charges; that the difference in cost for packages weighing from 5 to 8 pounds will be slight, and that for packages weighing more than 8 pounds the advantage will be with the companies. The superintendent of one of the companies said last week that its greatest loss last year was in handling the small packages, which the Government, it is expected, will carry hereafter. This indicates that the companies' profits may not be reduced. But there is to be a hearing in October concerning the new schedule and system of charges proposed by the Interstate Commerce Commission for the companies. If these proposed rates (which, the companies claim, involve a reduction), should be adopted, there would be a change of conditions, and the effect of such a change cannot be foreseen.

....In the opinion of trade authorities the recent cotton report indicates a crop of at least 14,000,000 bales.

....In Washington, last week, $100,000 of 4 per cent. Porto Rico bonds were sold, $30,000 to the estate of Mary Baker G. Eddy at 104.01, and $70,000 to Indianapolis bankers at 102.20.

...."Continuous advance in trade activity," said *Dun's Review* last week, "is the tenor of the reports from the principal manufacturing and distributing centers." "Every prospect pleases," said *Bradstreet's*, "and trade continues its onward march."

....Returns to the Bureau of Navigation show that during the current fiscal year the shipyards of this country will be more busily employed than in any year of the last decade. On July 1, the yards reported that 120 steel vessels were being built or under contract.

The Independent

VOL. LXXIII NEW YORK, THURSDAY, SEPTEMBER 19, 1912 No. 3329

Survey of the World

The Maine Elections

Maine voted for Governor on September 9. Fair weather was favorable to a large vote in the rural districts, and the result was the election of the Republican candidate, William T. Haines, who received 70,928 votes, against 67,905 cast for the Democratic incumbent, Frederick W. Plaisted, whose plurality in 1910 was 8,735. In other words, in two years 4,758 votes have been transferred from the one party column to the other. Apparently there will be 23 Republicans and 8 Democrats in the new State Senate, and 79 Republicans and 72 Democrats in the House; or a Republican majority of 22 on joint ballot. This seems to insure the election of ex-Congressman Burleigh to the United States Senate to succeed Obadiah Gardner, the Democratic Senator. Tho the Democrats have lost the local election, there is every reason to suppose that they will carry the State in November. For, as compared with the vote for Governor in the last Presidential year they show a gain of 1,830 votes, while the Republicans show a loss of 2,800. Moreover, the Republicans and Progressives have worked together for the Republican State ticket, but will be split when it comes to the Presidential election. Halbert P. Gardner made the announcement, on September 10, that the Progressive element had won the governorship for Mr. Haines "in order to carry out the agreement made with the Republican leaders," but from now on Progressives would "seek election for Roosevelt Presidential Electors," who will be nominated by petition. The Democratic State chairman, J. P. S. Wilson, declares the result encouraging, for Maine is a Republican State. William G. McAdoo, acting chairman of the Democratic National Committee, exprest his disappointment, but stated that "Maine is a Republican State, and the result was determined wholly by local conditions and local issues." He added that Maine is no barometer, as is proved by the fact that in the two years when Grover Cleveland was elected President the State went Republican in the gubernatorial contests by 20,000 and 14,000 majorities. Mr. McAdoo preached, however, against "the apathy of overconfidence." To ensure victory Democrats must cease "all unnecessary fighting within the ranks," and must subscribe to the campaign fund. Governor Wilson, exprest his satisfaction at the prospect suggested by the vote in Maine; so, for that matter, did President Taft, who sent Governor-elect Haines a congratulatory telegram. Chairman Hilles, of the Republican National Convention, said that the result "must prove the utter folly of a third party entering the race."——There was voting in Arkansas also on the ninth, and the Democratic ticket, headed by Congressman Joseph T. Robinson, gubernatorial nominee, was elected by the usual large majority. The proposal for State-wide prohibition was overwhelmingly defeated. The vote on the "grandfather clause," which sought to disenfranchise the negro vote, was heavy, and the result remains in doubt, tho seemingly the proposal is defeated.

New York State

Oscar S. Straus, the Progressive nominee for Governor of New York, plans a vigorous campaign of the

State, to begin early in October. He is said to be so strong with the members of Mr. Hearst's Independence League in Brooklyn that the local leaders of that organization plan to work for his endorsement at their State convention. On the 9th inst. Mr. Straus attended a meeting of the arbitration board of seven which is considering the demands of the engineers of Eastern railways. In view of his nomination, Mr. Straus tendered his resignation as chairman of the board, but was persuaded to reconsider.——Washington reports state that the President favors his Secretary of War, Henry L. Stimson, for the Republican nomination for Governor of New York. Two years ago Mr. Stimson was the nominee, and Mr. Roosevelt stumped the State for him. Party leaders are said to oppose the project. The district-attorney of New York County, Charles S. Whitman, is named as another candidate. The Republican convention will be held at Saratoga on the 25th. The Democratic ticket will be named at Syracuse on October 1. Election day is November 5.

Governor Wilson's Campaign

Gov. Woodrow Wilson left Sea Girt on September 15 for Chicago, his starting point for a swing thru Iowa, South Dakota, Minnesota, Wisconsin, Illinois, Michigan and Ohio. On the 21st he will speak in his own State; on the 23d at Scranton, Pa. Then he will tour Connecticut and Massachusetts. On October 5 the nominee will confer with Mr. Bryan at Lincoln, Neb. ——On September 12 Governor Wilson attended the State Fair at Syracuse, N. Y. His audience was chiefly composed of farmers, and he confined himself to the tariff question and the cost of living, especially meat prices. But what was most interesting to the general public was the attempt made by Charles F. Murphy, of Tammany Hall, and by Governor Dix, a candidate for renomination, to make political capital out of the Governor's presence at Syracuse. This was checkmated by the Presidential nominee, who stated that his visit to Syracuse was "without political significance," and is said to have gone out of his way to snub Murphy and Dix.——On the 9th Governor Wilson made three speeches in New York City. Before the New York Press Club he discussed the regular and insurgent Republicans, acknowledging that among the latter, besides men out for their own interests ("the less said about them the better"), there was "a noble group of men and women who had joined the party because its platform embodies most of the ideas and most of the purposes for which they have fought." But he regarded as "a certain impediment to progress" the new party's proposal "to legalize monopoly, instead of defeating, instead of reversing and remedying the evil things done under the mistaken leadership of the regular Republican leaders." He opposes "the partnership between great trusts and the Federal Government." And the united, enthusiastic Democratic party is, he asserts, "the only organized force by which you can set your government free." Earlier in the day the Governor opened the "Tariff Chamber of Horrors" in Union Square West with a speech on the iniquity of the sale of American beef abroad at lower prices than the protected Beef Trust sells it to Americans. "I want these men to take their grip off American industry," he concluded. "I want to have it set free to master the markets of the world." It was on the 9th also that Governor Wilson helped to organize the Bureau of Health Conservation in New York, which has chosen Dr. Wiley president.——On the 10th, at the national encampment of the Association of United Spanish War Veterans at Atlantic City, the nominee addrest an enthusiastic audience of 6,000. "For the time being I represent a political party, but I respect that party only as it is a means of banding men together for a common service," he declared. "I am not interested in fighting persons, but I am very much interested in fighting the things that are inimical to the higher life of our people and lower the standards of our public morality."

Mr. Roosevelt

Mr. Roosevelt, speaking in the Coliseum at San Francisco on September 14 before a large audience, criticised Governor Wilson for having said that "the history of liberty is a history of the limitation of governmental power, not

the increase of it." This the ex-President regarded as "a bit of outworn academic doctrine." Governor Wilson stands "for a policy which necessarily means, if his policy is honestly put into effect, that he must be against every true progressive measure," Mr. Roosevelt continued. —— In the *Outlook* Mr. Roosevelt amplifies his views on tariff revision, which, he says, should be schedule by schedule, as advised by the reports of a "permanent, expert and non-partisan tariff commission."——On September 9 Mr. Roosevelt addrest 5,000 women voters in Spokane, Wash. He announced that he became a suffragist thru association with women like Mrs. Mason, Miss Jane Addams, Miss Keller and Miss Dreier. At Portland, Ore., on the 11th, he denounced the "traitors" who had betrayed the cause of suffrage in that State. He read a telegram announcing that Governor-elect Haines, of Maine, had come out for him, and this stirred great enthusiasm. (So far Mr. Haines has remained strictly neutral. He is indebted to Republican and Progressive votes alike for his victory over the Democrat.)——John M. Harlan, of Chicago, J. Adam Bede and other Republican speakers will follow Mr. Roosevelt's trail thru Idaho, Utah, Nevada, California and Colorado. In Ohio the Republican campaign will be opened by Senator Lodge and ex-Vice-President Fairbanks. For the Democrats, Mr. Roosevelt will be dogged by Mr. Bryan. Senator La Follette is starting upon a Western tour in the interest of Progressive candidates on State tickets. Other Progressive speakers will be ex-Attorney-General Bonaparte, Miss Jane Addams, ex-Governor Fort, Jacob Riis, Comptroller Prendergast, of New York, and Messrs. David Dudley Foulke, Everett Colby, Frank Nye and Bourke Cockran. Miss Ethel Roosevelt, a daughter of the candidate, is taking part in the out-of-door campaign in New York City conducted by women Progressives. In Ohio, C. W. Hudson, of Madisonville, has been nominated by the Progressives to contest Mr. Roosevelt's son-in-law, Nicholas Longworth, in his campaign for re-election to the House of Representatives from the First Congressional District, as a Republican.

Progressive Party Finances

Elon H. Hooker, national treasurer of the Progressive party, issues a statement of receipts and expenditures from July 1 to September 9. At the New York headquarters, $53,327 was taken in; at Chicago, $1,872. Expenses of $51,682 are reported; unpaid bills, $3,561; outstanding contract obligations, $53,124. The largest single item under the latter heading is:

"Publicity department, for printing sundry pieces of literature as per contracts already entered into, $44,892.36."

No report is made on contributions received prior to July 1, tho it is stated that "the work of moulding the great mass of volunteer workers in this national crusade" has been a long one.

"Because of the unusually large element of volunteer work and because of the strict business methods adopted to enforce economies in every department, it is expected that the Progressive party in this campaign will expend less money than any other important national party. Nevertheless money is needed in substantial measure and dependence is being placed upon appeals to the average citizen thruout the country for subscriptions of small amounts to the fund."

George W. Perkins and Frank A. Munsey are the largest subscribers since July 1. They are down for $15,000 each. The name of Medill McCormick, of Chicago, does not appear, nor does that of the Pinchot brothers, tho an aunt of the Pinchots, Mrs. A. E. Wood, of New York, subscribes $5,000. Other generous contributors are George Moore ($5,000), W. Emlen Roosevelt ($1,000), G. W. Emlen Roosevelt ($1,000), Mrs. M. Emlen Roosevelt ($500), and John T. McCutcheon, the cartoonist ($250). Single contributions as small as $1.50 are acknowledged, and many of the subscribers are women. Little financial aid has been contributed from the South.

Nicaragua's Revolution

The revolution in Nicaragua is dying out, owing to the presence of American marines and to several victories won by the Government's forces. There are 800 marines at Managua and 800 at Leon. Others are on guard at points on the railroad line. Trains were running regularly last week between Managua and Corinto. Marines made their way to

Granada, where there has been much suffering. The clergy had called for help, saying that residents were dying in the streets of starvation. It is said that General Mena would like to become a party to a peace agreement. Other rebel leaders, however, are at variance with him. It is proposed that all shall consent to a new Presidential election, to be held under the supervision of the United States, and this plan may be accepted. Juan J. Estrada, leader of the successful revolution of 1909, who asserts that he is the lawful President, said, last week, before he left New York, that Nicaragua could be saved from ruin only by an American protectorate, or by such American supervision as is exercised in Cuba. A majority of Nicaragua's revolutions, he added, had been financed by Americans who sought concessions or monopolies. Mena, he asserted, has such support, and he admitted that he himself had been aided in 1909 by representatives of business interests. He gave the names of two or three, with the sums they contributed. ——By proclamation, President Taft will enforce in the Canal Zone the principles of the Workmen's Compensation bill which failed to become a law at the recent session of our Congress. The Navy Department expects that the canal will be opened for traffic in December, 1913. In order that naval officers may inspect the locks and other mechanism before the water is admitted, the Atlantic fleet (including more than twenty ships of the first class) will assemble at Colon in December or January next.

The Situation in Mexico

There was less anxiety, last week, concerning the American mining towns in Sonora. To Cananea 500 Federal soldiers were sent, and an equal number to Nacozari. But the mining camp of El Tigre was captured by the rebels on the 14th. No American was killed there, however, nor was the mining property injured. Salázar's rebels had been menacing Agua Prieta, which adjoins Douglas, Ariz. Mr. Taft sent warning that no shots must be fired across the line. This caused a postponement of the attack, and in the meantime 900 Federals arrived from Juarez, having been permitted by our Government to travel by rail from El Paso in American territory. Salazar's men have burned eighty bridges on the Southern Pacific's Mexican road, and the company appealed to our Government for protection. Ojinaga (near Presidio, Tex.) was defended by the Federals for several days, but at last the rebels captured the town. On the 15th, however, it was retaken by Government troops. General Orozco's father, recently commander at Juarez, fled from Ojinaga into Texas, and was arrested there. For several months there has been a warrant out for him. The charge is that he smuggled ammunition. Seventeen rebels captured at Ojinaga will be put to death. In the South there was no improvement, altho the Maderists won a four days' fight against Zapatists and Indians in Oaxaca. Near Acapulco, eighty plantation negroes rebelled, and seventy-four of them were killed. There were stories about the discovery of a formidable plot against Madero. It was said that Huerta, the Federal commander, had conspired with Orozco and Zapata, that the army was disloyal, and that it would turn against the Government within a few days. There were signs of disaffection at the capital, where Madero was hissed in Congress and thousands paraded in the streets, denouncing him and shouting for Diaz. It was pointed out that the army in the north had become inactive and indifferent. Senator Fall, at El Paso, again recommended that the belligerency of the rebels be recognized. Senator Smith, engaged there in making an investigation, said a crisis in the affairs of Mexico was imminent. He spoke of the destruction of great quantities of property, and added:

> "So many cases of wanton oppression and hardship have presented themselves to our committee, and seemingly so little has been done by our Government to strike at the root of the difficulty, that I am not surprised to find among the more reckless of the Mexican people a disposition to belittle our prowess, defy our strength and misconstrue our motives."

He asked for "a firm, vigorous, determined and unrelenting foreign policy." Ernesto Madero, Mexico's Secretary of the Treasury, says that the Manning-McIntosh claim, $105,000,000, now held

and supported by a syndicate in New York, is null and void.

The Midlothian Election None of the by-elections for Parliament have excited so much interest as Midlothian, because the historic constituency of Gladstone had come to be regarded as a measure of the standing of Liberalism and because the voting in this case would indicate the effect of the split between the Liberal and Labor parties. Up to 1880 Midlothian had always been Conservative, but in that year Gladstone captured it after a hot campaign by the narrow majority of 211. In the next election, five years later, under an extended franchise, Gladstone secured 4,671 majority, and his hold upon the seat was so strong that in the following year the Conservatives did not put up a candidate against him, tho they did in 1892, after he became a Home Ruler, and cut down his majority to 690. In the three most recent elections the Liberal majority has been above 3,000. So, too, apparently, it would have been this year if it had not been for the fact that both Liberal and Labor candidates were in the field. The Master of Elibank, now Lord Murray, who had previously held the seat, at first selected as his successor Arthur Shaw, a Liberal, but afterward wrote a letter commending in the highest terms Provost Brown, the Labor candidate. The chief support of Mr. Brown was the trade unions, and his program was a radical one, including land nationalization and a substantial increase of the old age pensions, now $1.25 a week. The Conservative candidate, Major Hope, confined himself chiefly to an attack upon the Liberal measures now pending in Parliament, the Irish Home Rule bill and the Welsh Disestablishment bill. The election of September 11 resulted as follows: Major Hope, Conservative, 6,021 votes; Arthur Shaw, Liberal, 5,989 votes; Provost Brown, Labor, 2,413. The Opposition is greatly rejoiced over the outcome of the Midlothian campaign, altho the slender plurality of 32 affords little ground for congratulation. The result, however, proves the necessity of the Liberals and Laborites working together if they wish to remain in power long enough to carry out their ambitious program of social reform.

Syndicalism and Federalism Altho the Labor party has in Midlothian demonstrated its power over the fortunes of the Liberals, there is a growing dissatisfaction in the ranks of its supporters with its methods and accomplishments. It is true that many important pieces of legislation in the interests of the working classes have been put thru by the Liberal-Labor coalition, such as the minimum wage for miners, the old age pensions and the insurance act, more tangible advantages such as the raising of wages and recognition of the unions have been during the past year attained by the use of the more violent weapons of the strike and boycott. In fact, it was the miners' strike which originated and forced thru Parliament the minimum wage bill within a few months, while if it had waited the course of ordinary political procedure it would have been relegated to an indefinite future. Consequently there is developing a faction of the Laborites which puts more faith in "direct action" than in political expedients and tends more toward syndicalism than socialism. The same tendency is manifest in the United States, as shown by the growing power of the I. W. W. and the Lawrence strike. In the British Trades Union Congress, held in Newport the first week of September, the question of syndicalism came up and several of the delegates spoke in favor of it. One speaker said that the Trades Union Congress ought to become the industrial parliament of the future. Another said that a belief in the efficacy of political action was a popular superstition and adduced the case of Australia, where, he claimed, the Labor party was in power but had made no great change in the economic position of the workers there. The discussion, however, was on the whole strongly against syndicalism, and at its conclusion the Congress past, by an overwhelming vote, a resolution reaffirming "its continued support of independent working-class political action in helping the industrial fight for a more equitable share of the wealth produced."——Winston Churchill, First Lord of the Admiralty, who has a penchant for doing un-

expected things, has projected a scheme for the decentralization of government in the British Isles. In an address at Dundee, with the proviso that he was speaking for himself alone, not as a representative of the Government, he suggested that it would be advisable to extend home rule not only to Ireland, but also to Scotland and Wales, even to England. In the last case it would be necessary to divide England up into provinces, each with its local parliament and executive, one for Lancashire, one for Yorkshire, one for the Midlands, one for Greater London, etc. This would relieve the central Parliament of its present burden of local affairs, and, by including representatives of the self-governing colonies, it would become truly an imperial body. The comment upon Mr. Churchill's proposal is almost altogether hostile and many papers denounce it in vigorous terms as an attempt to Americanize Great Britain and to restore the Heptarchy.——The excitement in Belfast over the prospect of home rule is increasing. On Saturday a football match turned into a free fight between Nationalists and Unionists, in which sixty persons were severely wounded. A ten-day campaign to organize resistance will begin on September 18 and it is claimed by the leaders in the movement that by the end of it nearly 1,000,000 people will have pledged themselves to uncompromising hostility to the proposed Dublin Parliament. Ulster Day, September 28, is to be a legal holiday, and the Unionist Council then in session at Belfast will declare its program of opposition. Those who take the pledge agree to "(1) refuse to acknowledge a parliament in Ulster, (2) refuse to obey the laws it may make, and (3) refuse to pay any taxes it may impose." The Ulster newspapers justify their action by the precedent of the Americans in refusing to submit to the Stamp Act.

Turkey and the War

Unofficial negotiations have been for some time going on between representatives of the Italian and Turkish governments at Chiasso, Switzerland, but the reports of the progress of the conference are mostly unreliable rumors. It is, however, assumed with some probability that Turkey is willing to withdraw her troops from Tripoli, but not to formally acknowledge the annexation of her African possessions by Italy. The Italian Government is said to have made the proposal that Turkey proclaim the independence of Tripoli and Cyrenaica, after which Italy was to announce their annexation. This, it appears, was not acceptable to the Ottoman Government. Italy is understood to be ready to pay a considerable sum of money to Turkey to secure the prompt conclusion of the war and also to be willing to recognize the spiritual allegiance of her Mohammedan subjects to the Caliph of Constantinople.——Notwithstanding the peace negotiations, the war in Africa is of late being more actively prosecuted than before. The Italian advance from Derna began on the 14th, under General Reicoli, in the direction of the headquarters of the Turkish commander, Enver Bey. An aeroplane was for the first time captured in war when Captain Maizo, while flying from Zuara to Tripoli, fell into the hands of the enemy thru a forced descent, owing to the stoppage of his motor in mid-air. ——There has been some skirmishing on the Turco-Bulgarian frontier, and many rumors of an outbreak of war, but it seems that the remonstrances of the Powers, and particularly the refusal of the French Government to allow Paris bankers to advance the money for the $16,000,000 loan unless the Bulgarian Government maintains peace, will prove effectual in restraining Bulgaria from carrying out her threat to attack Turkey in support of Macedonian autonomy. The Macedonians are agitating for the privileges conceded to Albanians, and will appeal to the Powers for aid in securing autonomy.

The Funeral of the Japanese Emperor

On September 4, at 1 a. m., the body of the late Emperor Mutsuhito, posthumously known as Meiji Taisho, "Emperor of the Era of Justice," was conveyed to his last resting place at Monoyama on a two-wheeled cart drawn by five oxen. The most prominent statesmen of Japan took part in the procession. Among the pallbearers were General Kuroki, General Oku, Admiral Togo and Vice-Admiral Sato. A mixture of the

ancient Shinto rites and twentieth century military display characterized the solemnities. The streets in Tokio were lighted with both electricity and torches. At midnight thousands of bells in the Christian churches and the Buddhist temples tolled, and guns were fired everywhere in the Empire. The funeral dirges were played with musical instruments of ancient types. Behind the coffin walked with slow step the grand master of ceremonies, bearing the late Emperor's sword, and the master of the household with the imperial sword. The cortege passed by hundreds of thousands of the Japanese soldiers and people, who bowed down their heads and stood in silence. The late Emperor Meiji Taisho in late years was weak, but in early youth he was fond of such sports as boxing, fencing and riding, and was considered as a very strong man. He was industrious and simple in living. Meiji Taisho had a strong and engaging personality, and was a gifted poet. Many of his verses have been published in THE INDEPENDENT in the original and translation. He will ever be remembered by his people, for in his reign Japan evolved from barbarism to become a world power. Among those who represented their governments at the funeral services of the late Emperor were Prince Arthur of Great Britain, Prince Henry of Prussia, Infante Alfonso of Spain, and Philander C. Knox, of the United States.

The Suicide of General Nogi

General Count Marosuke Nogi, hero of Port Arthur, and his wife, paid their last tribute to the late Japanese Emperor Mutsuhito by committing suicide in their home at Alasaka as the Emperor's funeral train was about to start for its last resting place at Momoyama. The general's act is in accordance with the Japanese feudal customs of harakiri, or voluntary suicide as a token of bereavement. It is believed that the souls of the general and his wife have, in this way, joined the Emperor. Count Nogi and his wife attended the funeral services at the Ayama parade, after which they returned home to carry out their suicide plan. They drest in full Japanese costume and killed themselves at the moment when the signal for the departure of the cortege was heard. The suicide caused a great sensation thruout the world, but by many Japanese it is not regarded as an extraordinary event. There are 1,500 harakiris every year in Japan, half of which are voluntary. General Nogi was born at Hagi, in the Province of Cheshu, in 1849. He was a member of the Samurai class. When he was a boy his father taught him to be brave and not afraid of death. General Nogi was a man of poise and self-command. He was a song writer, a statesman, a diplomat and a soldier. He was for ten years governor-general of Formosa, where he was engaged in suppressing the warlike tribes. When the Russo-Japanese War was broken, General Nogi was appointed commander-in-chief of the Japanese land force. During the war his two sons, the only children he had, were sacrificed. He was especially noted for the charge of the Japanese troops up 203 Meter Hill. At the time of his death he was the supreme military councillor of the empire.

National Chinese Railroads

Dr. Sun Yat-sen has been authorized by the Peking Government to build national railways covering a territory of 70,000 miles in extent. Mixt Chinese and foreign companies will be given concessions to participate in constructing the roads for a period of forty years, after which the lines are to revert to China. But the roads in the frontier provinces will be built by the Chinese Government. This action will open the whole country to foreign traders, and involves a great extension of the privileges to foreigners.——The preliminary agreement to the Lloyd's loan of $50,000,000 was recently signed by A. Wendell Jackson and the Chinese Minister in London. The terms of the agreement include the establishment of a band with its headquarters in London, and the capitalizing of $10,000,000, half of which is to be contributed by Chinese——Last week there arrived at the United States twenty-eight Chinese students, who were sent here by the Governor of Kwoungtung Province.——Prince Na, formerly the president of the Mongolian alliance, has gone to Mongolia to convince his rebellious people of the necessity of supporting the central government.

The Passion Play at Erl

BY NEIL C. BROOKS

[Professor Brooks, of the University of Illinois, who here writes of a passion play less spoiled by notoriety than that of Oberammergau, has devoted himself for many years to the study of medieval German miracle plays.—EDITOR.]

ERL is a charming little village of North Tyrol that has attracted attention this summer because of the passion play given there.

Back in the middle ages Tyrol was a center of interest and activity in the religious drama, and passion plays survived in this devoutly Catholic region long after the Reformation and Luther's disapproval put an end to them thruout most of Germany. Even here, however, with changing social and intellectual conditions they passed gradually from the cities to the villages, and most of them finally disappeared entirely. In four Tyrolese villages the peasants give passion plays at the present time, in Brixlegg, Inzing, Vorderthiersee and Erl. Aside from these in Tyrol there is a play that has been given for about a hundred years at Höritz in Bohemia, also one, probably still older, at Waal in Bavaria, and several others of recent origin, in all a considerable number of almost unknown passion plays in addition to the world-known Oberammergau.

Of the less known plays the one at Erl is the oldest. It can be traced back to 1697, thus back to the same century in which the play at Oberammergau began, and interestingly enough the early versions of both plays rest upon one and the same earlier play, namely, a "Tragedy of the Passion," which was written

TALDORF ERL IN THE NORTH TYROL

THE HIGH PRIESTS OF THE PASSION PLAY

about 1565 by the Augsburg Mastersinger Sebastian Wild.

No information has been preserved about the performance in Erl during the eighteenth century. The text doubtless felt the influence of the Jesuit drama and became more ornate and allegorical. This is still seen in nineteenth century texts. An interesting allegorical prolog from the early part of the nineteenth century has been preserved. It represents Justice and Mercy in conflict concerning the salvation of the soul. This allegory was a popular one back in the middle ages, but this version with its Alexandrine verse and with Death and Lucifer supporting Justice and Penance and Heavenly Love, coming to the aid of Mercy, shows eighteenth century influence.

With the fondness for allegory was also a fondness for the grotesque, and the Erl play became proverbially noted for its devils as Vorderthiersee was for its angels and the village of Kiefersfelden in this same region for its knights in the old plays of chivalry given there. As late as the performance of 1859 Lucifer with his whole family of big and little devils played an important part, especially in the Judas scenes, and the huge jaws of hell opened with fire and smoke quite in the medieval way.

The authorities of the district took exception to various grotesque and unseemly features of the play of 1859 and suggested a revision of the text for the next performance. The revision was made in 1868 by Franz Angerer, a priest who had just come to the village as assistant pastor. All the objectionable features, including the devils, were eliminated, the tiresome Alexandrines gave way to blank verse, and the result was a really excellent text, which is still used.

The Erl text seems to me unquestionably superior to that of Oberammergau. Its blank verse is a more dignified and suitable form than the prose of the Oberammergau text. It is freer in retaining legendary features if they serve

MARIA HOFER AS MARY

to highten the dramatic effect; such, for instance, is the retention of the touching little scene found in some of the medieval plays where Mary meets Judas just after he has decided upon the betrayal and commends Christ to his especial care; such also is the dream of Claudia, wife of Pilate, and her efforts to save Christ. Added effectiveness is given to the council of the Jews thru the character of Sirach. In the council are Caiaphas and his followers as enemies of Christ; his two champions, Nicodemus and Joseph of Arimathea, and this Sirach, an open-minded member who at first is rather inclined to side with Caiaphas but is gradually convinced of the innocence and divinity of Christ. A peculiar and interesting feature, altho one that is less commendable, is that of having one of the soldiers at the crucifixion a German, who in casting lots wins the seamless garment of Christ and announces that he is going to take it to Trier (or Treves, the German city where it is still preserved and exhibited at intervals). In a patriotic outburst he exclaims: "Germany must have it and exhibit it to the world until the end of time! Jew, you can see it when you come to us as a beggar! It is all over with your race, and for us a new era begins in the seamless garment of Christ!" In the play at Erl, as at Oberammergau, beautiful tableaus are introduced showing the Old Testament events that symbolize or prefigure the successive events in the life of Christ.

So far as the dates of performances are known, the Erl play has always been given at approximately ten year intervals. In the first half of last century it was given in the attic of the largest inn of the village. After a successful performance in 1850 a theater was built, a plain board structure seating about six hundred. For the play of 1892 (and 1893), and especially for that of 1902, this building was entirely inadequate, so for this year a new and well equipped theater has been built with seats for fifteen hundred people. The general arrangement of the stage, with proscenium, middle stage streets of Jerusalem and houses of Annas and Pilate, is the same as that of Oberammergau. The chief difference is that here the stage is entirely enclosed, a disadvantage in fair weather but an advantage in such cold and rainy weather as has been the rule this summer.

In speaking of the performance itself and the performers one turns naturally to a comparison with Oberammer-

THE CHRISTUS OF KASPAR PFISTERER

GEORG RAINER AS JUDAS

gau. Without doubt the Oberammergau performance is more finished and artistic, the general average of the acting is higher, there is but little trace of dialect in the speech, and in text and presentation everything is avoided that could offend the most fastidious taste. As a result, it doubtless affords a higher esthetic enjoyment, and possibly more religious edification to cultured auditors.

On the other hand, to one who has an historical interest in the passion plays or is interested in them as "folk-plays" given not only by but also for the peasants and simple devout people of a Catholic community, there is more of interest in the Erl play. Many factors contribute toward giving the play this more popular character. One is the audience itself, which still consists largely of the peasants and the humbler classes of Tyrol and South Bavaria. Then there are features about the content of the play that are more popular. Some of these were mentioned above. Other instances are the Good Shepherd with his live sheep about him and the tableau of Jonah and the whale as prefiguring the Resurrection, a tableau that is omitted at Oberammergau. The dialect of the players, not quite so broad as in their everyday speech but still very marked, seems in keeping with play and audience. The simple music and the poor singing of the chorus has a homely effectiveness, especially if one knows that the music was composed by a peasant of the village over forty years ago and is still under the direction of this same peasant, now a man of seventy. The character of Judas is treated in a popular way with a touch of that humor which is almost always found in this character in medieval plays. In fact, there is much about the play and the audience to help one to a better conception of the great popular passion plays of the middle ages.

The play at Erl has never been so directly an undertaking of the community as that at Oberammergau. It seems always to have been arranged and managed by a Passion Play Society consisting of a number of the citizens of the village. The custom has always prevailed, however, of donating a liberal part of the proceeds to the village church; in fact, the saying, "The church

THE KISS OF JUDAS

needs money, we must play the Passion," has become proverbial in Erl.

The large expense of the new theater, new equipment and new costumes, the opportunity thus afforded of giving a better performance, and the larger seating capacity now available, all this has led Erl this year to make an appeal for the first time to a larger public and even to place their tickets in the hands of tourist agencies. It is really to be hoped, however, that there will not be too generous a response to this appeal, and that audience and play will remain as simple and popular as they are at present.

URBANA, ILL.

The Lady of the Silver Veil

BY COLETTA RYAN

HAVE you ever seen the Lady of the Silver Veil?
I have sought her in the valley, I have climbed the mountain trail,
I've searched the sun and shadows, I have asked the willow pale:
"Have your lyric leaves been rustling o'er a veil, a silver veil—
Have you ever seen the Lady of the Silver Veil?"
By the deepening hedge at twilight I have strayed, and silently
I've followed saint and silhouet across the fading light—
I've joined the journeying gypsy in a woodland revelry—
I have been the daytime's daughter, I have neighbored with the night;
Yet I cannot find my lady, tho so long I sing and sail,
The loved, elusive Lady of the Silver Veil.

All the garden-groups stand waiting while her godmother, the rose,
Asks fondly for her spirit charge. No songstress will disclose
The secret path she entered, or what company she chose.
The fairies sigh, the night birds cry, and over hill and dale
The fainting flowers in hidden bowers call softly for the veil.
How fragrantly they all agree to serve the silver veil.
(They lean in watchful loyalty to hear the rustling veil.
And they fancy 'tis the stir of leaves, the simple, silvering tale
That sparkles on the poplar that their courage may not fail.)
Have you ever seen the Lady of the Silver Veil?

I think she passed me in the grove, and oh! her face was fair—
She's mirrored in the grateful lake, encircled by her hair.
She is the wind-flower born at morn, a white dove whispering—
And all dear women she invites to shelter 'neath her wing.
Her voice once echoed o'er the hills in childhood, and I see
On yonder cloud the corner of the veil she left for me.
She's lurking in a kind remark, her language soft and clear,
Becomes a moonlit melody upon the wilting year . . .
She follows winter with a cloak. In summer, 'neath the trees
She fans the world with loveliness, and hums high harmonies.
She's living poetry on earth, and heaven sinks to rest
Upon the rhythmic tenderness that sanctifies her breast.
The gentle mood of motherhood of all the world breathes low
The favoring fondness it must feel in love and loving so.
She has a thousand spirit-arms, her veil, floats broadly o'er
The murmuring millions 'neath her care. She is a tranquil shore—
A shining strand of power and peace. Translating earth and sky,
She's human lured by song and star to travel hopefully.
She is a language born of light, faith's everlasting youth,
A prayer, a message, half divine that leads man back to truth.
The soul of widest liberty for winged womanhood,
Unfettered, strong, sublimely free and great as she is good.

Have you ever seen the Lady of the Silver Veil?
I have sought her in the valley, I have climbed the mountain trail,
I've searched the sun and shadows, I have asked the willow pale:
"Have you ever seen the Lady of the Silver Veil?"
And they answer: "Yes, at twilight, where the forest flowers are blue,
She passed along with veil and song, and softly asked for you!"

BOSTON, MASS.

The Problem of International Peace

BY PRESIDENT WILLIAM H. TAFT

[At our request, the President of the United States has kindly consented to allow us to publish the following compact statement of his views on the subject of International Peace, as given more at length, or in various fragments in other addresses and interviews. It is greatly to be regretted that the Senate is not as ready as is President Taft to refer to arbitration any question whatever that might arise between us and any other nation.—EDITOR.]

TO say that one is opposed to war and in favor of peace is not much more startling than to say that one is in favor of honesty and virtue and opposed to evil. We hear a great deal nowadays of movements of societies and legislative resolutions in favor of international peace, and I assume that no one would wish to be put in the position of denying that peace contributes greatly to the happiness of mankind, or of advocating war as an institution to be fostered. But that from which the world can derive the most benefit is practical suggestions leading to permanent peace.

Many have thought that this could be brought about by an agreement among the Powers to disarm, and some sort of a convention by which the race to bankruptcy in the maintenance of great armies and the construction of great navies might cease and a gradual disarmament follow. Future events may justify some other conclusion, but movements in the past along this line have not been fruitful of practical results. The burdensome weight of debt involved in continued armament may some time bring about a change in the present national tendencies. And whenever it comes we shall not be, I am sure, the Power to interfere with such a general movement. The expense of armament is working toward it. The cost of war, I am sorry to say, is having greater weight than the expense in lives. A nation does not now lightly enter upon war for two reasons: First, because the expense is so great that it is likely to lead to bankruptcy even if she wins; and second, if she does not win, the nation, the government or dynasty is likely to go down at the hands of her own people under the humiliation of that defeat. Of course, these two things are working in a healthful way toward ultimate peace.

In the meantime, I am strongly convinced that the best method of ultimately securing disarmament is the establishment of an international court and the development of a code of international equity, which nations will recognize as a better method of settling international controversies than war. We must have some method of settling issues between nations, and if we do not have arbitration we shall have war. The awful results of war, with its modern armaments and frightful cost of life and treasure, and its inevitable shaking of governments and dynasties, have made nations more chary of resort to the sword than ever before; and therefore have rendered the present an excellent time for pressing the substitution of courts for force.

If we have a permanent court of arbitration—one to which we can easily refer all questions—the opportunity is likely to be seized upon, certain to be seized upon by that country which is not fully prepared for war. And as a resort to this permanent court becomes more and more frequent, questions which can be submitted, in the view of nations, will grow broader and broader in their scope.

War has not yet disappeared and history will not be free from it for years to come. But the worst pessimist cannot be blind to the fact that already, in the last twenty-five years, long steps have been taken in the direction of the peaceful settlement of international controversies, and that the establishment of a great arbitral court for all nations is no longer the figment of the brain of a dreamy enthusiast.

I yield to no one in my love of peace and my hatred of war and my earnest desire to avoid it. No one goes further

in favor of settling international controversies by arbitration than I do. And if I had my way and was able to secure the assent of other Powers, I should submit to the Senate arbitration treaties broader in their terms than any that now exist between nations. In laying down my office I could leave no greater claim to the gratitude of my countrymen than to have secured such treaties. For this reason I welcome most highly the rapidly increasing ranks of the advocates of peace. They help to form the public opinion of the world which, with appreciable progress, is forcing nations to a settlement of quarrels by negotiation, or by peace tribunals.

There was a time when questions of honor could only be settled between gentlemen on the dueling field, and many a valuable life has been sacrificed to a standard of ethics which the world has now discarded. It required more moral courage then to avoid a duel than to fight one. But we have made great progress in such ideals; and if this be true of men why may it not be true of nations? Why should it not show more patriotism and more love of country to refuse to go to war for an insult and to submit it to the arbitrament of a peace tribunal than to subject a whole people to the misery, the cruelty, the suffering and the burden of heavy cost of war, even tho glossed by the excitement, the ambitions and the glory of a successful conquest. Lessons in national restraint, looking at things as they are, rejecting the dictates of false pride, and following the teachings of the Master of men, are not at all inconsistent with and do not detract from the continuance of the highest love of country. There is not the slightest reason why the same course may not be pursued between the nations in respect to questions of national honor as between men, and there is the best of reason why we should strain every nerve and avail ourselves of every possible honorable device to avoid war in the future.

I am not blind to the aid in creating sturdy manhood that the military discipline we see in standing armies furnishes, nor do I deny the incidental benefits that may grow out of the exigencies and sequelæ of war. But when the books are balanced the awful horrors far outweigh the benefits that may be traced to it. Those who have seen the horrors of war feel most deeply the necessity of avoiding it. One need not be a blind optimist and look forward to the complete establishment of a peace which cannot be shaken the moment arbitration treaties have been signed, but they are certainly long steps toward securing the peace of the world; and as we look back it will not do to say that great strides have not been taken. Under the inspiration of a common desire for peace many treaties have been made with reference to arbitration at The Hague and for the establishment of a permanent court at The Hague for the settlement of international disputes, all pointing to the ideal of the utmost use in the promotion of the cause of peace.

By negotiation and mediation and the formation of arbitration agreements wars, in the last decade, have been stopped in Central and South America in a most gratifying number of instances; but we must not expect too much. Moral changes among people and countries take place step by step. Moral progress begins with the individual, and unless we can find it there we are not likely to find it in any group of individuals or in the millions making up the state. The code of morals which governs the association of individuals will always be higher than that which obtains in the relations between nations. But as surely, progress among individuals means progress at a slower rate among nations and it is inevitable that the methods of settling disputes among individuals will furnish a precedent and a suggestion for the future method of settling controversies between nations. It will be the final answer to the question which the good people of all nations are agitating today. The closer acquaintance of nations with each other, the greater community of interests among them, the increase in the family feeling between them all press toward the avoidance of war. It is this real increase in the actual brotherhood of man and the interest of the citizen of one country in the citizen of another that has incalculably strengthened the demand for some sort of a temple of justice in which kings and nations may be parties and hearings

and judgments may take the place of battles and capitulations.

Great progress was made toward the proper response to this demand when at the instance of the Emperor of Russia The Hague tribunal was established. This was of course with exceptions and conditions and provisions, all of which limit the kinds of cases which go into that court; so we cannot say that there is a general provision, yet, for the arbitration of all questions between nations, but there is the machinery; there is the basis upon which future action can be taken and we may look forward with reasonable hope to the enlargement of the office of The Hague court until, after a while, it shall be a general international court, in which all nations shall be willing to put their claims and their defenses. And we can also be confident that war will not disappear until a method is furnished which shall satisfactorily settle all differences that must, in the nature of things, arise between the nations of the earth.

It is true that we already have treaties for arbitration, made for the purpose of settling controversies which arise between us and other countries, but there are exceptions in the description of the difficulties which are to be referred to arbitration, excluding all questions of honor and vital interest. It is needless to argue as to the meaning of those terms, for any one to realize that they are broad enough to exclude from arbitration the questions arising between nations which are more likely to produce war than the questions included under the treaties. It has always seemed to me that these exceptions excluded many questions which might just as well be arbitrated as any other; so that two years ago I stated, publicly, that as President I would be willing to assume the responsibility of initiating a treaty with one or more important governments for the arbitration of all international differences, even tho they included questions of honor and vital interest. This offer was soon publicly accepted by both England and France.

Such treaties would be of the utmost importance, not in the actual prevention of war between us and England or France, because the danger of such a cataclysm as that is, thank God, most remote, but they are important as steps toward the settlement of all international controversies between all countries by the peaceable means of arbitration. The fact that those two great nations were willing to contract with the United States to submit all controversies to an impartial tribunal could not but work for righteousness among all nations. The treaties provided that all questions which were justiciable should be arbitrated. The treaty defined as justiciable, first, that it must be a question between the two countries party to the treaty; second, it must relate to an international matter; third, both parties must be concerned in the matter; fourth, the concern of the complaining nation must be based upon a claim of right, under the treaty or otherwise; fifth, the difference must be capable of being adjusted by the application of the rules of law and equity, domestic or international.

Personally, I believe in arbitration to a point that I am willing to arbitrate anything in which I believe that I have good cause, and if I don't believe I have a good cause I want to give it up in advance of arbitration. But public opinion is perhaps not so far advanced as this, and to meet the case a joint high commission was devised, in the treaties, to be composed of six members, three appointed by each nation, who were to be given one year to decide upon the arbitrable quality of the difference, and the finding of this court must be five out of six to insure the submission of the question to the arbitral tribunal. I do not see why matters of national honor should not be submitted to a court of arbitration just as matters of property or matters of national proprietorship, as among men we have to submit our differences to the court, even if they involve honor. I do not see why questions of honor may not be submitted to a tribunal composed of men of honor who understand questions of national honor, as well as any other questions of difference arising between nations.

That which teaches nations and peoples the possibility of permanent peace is the actual settlement of controversies by courts of arbitration. The settlement

of the Alabama controversy by the Geneva arbitration, the settlement of the seals controversy by the Paris Tribunal, the settlement of the Newfoundland fisheries controversy by The Hague Tribunal are three great substantial steps toward permanent peace—three facts accomplished which have done more for the cause than anything else in history. International law is made up of international customs, traditions, and the formulations of international standards of ethics in treaties between civilized governments. This is the reason why—tho war between England, France, Germany, and the United States is practically impossible—the willingness of these great countries to submit all their differences, even of honor, to an impartial tribunal would be a step forward in the cause of peace for all the world that can hardly be overestimated. In fact, the next great step in the problem of permanent international peace lies in the positive agreement of some of the great nations of the earth to abide the adjudication of an international arbitral court in every issue which cannot be settled by negotiation, no matter what it involves, whether honor, territory, or money; demonstrating that it is possible for two nations to establish as between them the same system of due process of law that exists between individuals. There will be no prouder distinction in all history than will revert, forever, to the two nations which lead the world triumphantly toward permanent peace by being the first to take this next step. Nor is there any nation in a better position to set the example and take this step than our own United States.

In the two treaties which I have mentioned—between the United States and England and France—which failed to receive the full approbation of the Senate, the effort was made to approach nearer to the ideal arbitration treaty by removing the exceptions of honor and vital interest which weaken the effectiveness of our present treaties. There are of course questions of policy with respect to which each nation must exercise its own discretion, and in doing so is entirely within its legal and equitable rights—as much as an individual would be; but the machinery thus provided would practically dispose of every question so far as it could be a war-producing issue. In fact, considering the intermediate work of the joint high commission which was proposed, the treaties might almost have been considered conventions to avoid not only war but arbitration as well. For during the year which the commission was to be allowed, in which to consider the question and endeavor to discover some possible adjustment, public passion and excitement would have had a chance to cool, and even arbitration would seldom have become necessary.

But fears were roused in the public mind concerning the result of this broadening of the scope of arbitration. I do not think that they were well founded, and to prevent their recurring to obstruct the path of some future effort I will briefly refer to them. It was objected that an agreement to arbitrate a question of national honor ought not to be entered into, for the reason that when once honor is affected one will never consent to have a question arbitrated, and that to agree to do so, in advance, is to agree to do something that we will not be willing to do and that we do not intend to do.

I cannot concede the premises of this argument. I look upon a treaty of this sort as a self-denying ordinance, a self-restricting obligation. It is of the same character as the Constitution which the people as a whole set up, in which they impose checks upon their own power and limitations upon the method by which they will exercise the ultimate sovereignty which is in them. They realize that when the temptation comes to exercise arbitrary power they will feel like exercising it, and they deliberately impose limitations upon their own actions with the full intention that they shall be effective, however averse they may be to yielding to them when an occasion arrives for their enforcement. The law is full of such restrictions, and whatever the emergency, the law is generally obeyed. So, in agreeing to arbitrate questions of national honor, I see no reason why we may not pledge ourselves to do so, and why we may not have the moral courage, in spite of our impulse to the contrary, to submit such questions to

an impartial tribunal and await its judgment.

It was feared that by ratifying such a treaty the Senate might in some way abdicate its functions of treaty making, but I confess that I follow the claim with very little sympathy or acquiescence. The Senate is a part of the treaty-making power of the country. A treaty is a contract. It is an agreement by which those who make it bind the nation they represent to a certain course of action in the future. A treaty is a stipulation as to the future conduct of those who enter into it. If we have the right by treaty to bind ourselves as to our conduct under certain conditions in the future, we have the right to pledge ourselves to submit certain questions to arbitration, and we have the right to stipulate the conditions and the manner of presenting such questions. To say that this is an abdication of the functions of the Senate is to say that it is not a function of the Senate to make any agreement at all which shall bind the Government to future action. The treaty-making power is a very broad one and it is not straining it in the slightest to include within it the power to make a treaty of arbitration, to describe in the treaty a certain class of questions to be submitted to arbitration, and to commit to a tribunal of arbitration the power to decide, as future instances arise, whether they are in the class described in the treaty or not.

When we agree that we will submit all justiciable questions to the judgment of an arbitration, and decline to allow anybody to decide what is justiciable except ourselves, we give little sanction or pledge, in advance, of our willingness and anxiety to settle all possible controversies by arbitration. The treaty then is likely to become a mere expression of desire to arbitrate without the possibility of losing, and where our material or other interests will not suffer by defeat, or where the case is so clear that we are sure to win. If there is to be a real advance we must be willing to risk something thru making the treaty. I for one, in my profound desire to find some means of avoiding the awful cost and the horrors of war, am ready to run the risk and go fully to the point of submitting important international differences to a tribunal where we may win or lose.

Objection was also made to the treaties that under the agreement we might be called upon to submit the Monroe Doctrine to arbitration, to submit our right to exclude foreign peoples from our shores, or the question of the validity of the Southern bonds issued in reconstruction days. But to my mind these suggestions have nothing in them. The question of our Monroe policy is not a justiciable one. It is purely a governmental policy, which we have observed before the world for a century and in which the nations of Europe have generally acquiesced. The question of excluding immigrants is a principle of international law—that each country may admit of the people who come to its shores those whom it chooses to have admitted and may reject the others. It is a question of purely domestic policy in which no foreign nation could interfere unless provisions in their treaty with us affected the matter. And of the possibility of becoming involved over the obligation of certain Southern States to pay bonds issued during reconstruction which have since been repudiated, it is sufficient to say that such a question could not have come within the treaty, for the treaties only affected "cases hereafter arising." The cases of the Southern bonds all arose years ago.

I only refer to the objections which were raised to show that we could not be embarrassed in the slightest in respect to them thru the making of such treaties.

The question of permanent peace thru arbitration treaties is not closed. It will present itself again when we may be better prepared for it. And for the event, when it comes, there are a few things that ought to be said with reference to the spirit in which we should approach plans for the settlement of controversies without resort to war. In the first place, if we insist upon a plan in which we are always likely to win it will not probably approve itself to the nation with whom we propose to make the agreement. If we are afraid to submit to an impartial tribunal, lest we lose our case, then we would better go back to war as the only other means of settling international controversies. When we

enter into an agrement to submit our differences to an impartial tribunal we must be willing to lose, as we are anxious to win. An international court will be for the purpose of settling, one way or the other, real international differences, the settlement of which will be a great disappointment to one or the other of the parties. A court to decide between nations cannot find it any easier than a domestic court to decide a question so that both parties shall be pleased.

If arbitration is to be effected, and is to cover ground that shall really promote the cause of peace and prevent war, it must cover questions of the utmost interest to both parties, in the settlement of which one or the other must lose. When we come into a real arbitral agreement we must be willing to face the disappointment which comes with the loss of an important case. If the result is not to mean a real victory for one party and a real defeat for the other, then the subject of arbitration is merely for discussion in peace societies. In other words, if we are going into real arbitration we must play the game thru to the end. We must stand ready to take hard knocks with equanimity, just as we expect the others to, with the assurance that all the disadvantages which could ever accrue could never equal the horrible losses, the cruelty and the wickedness of war.

If we wish to make progress—real progress—we must enter into a contract that binds us to something. We cannot expect to win all our arbitrations; we cannot expect to have arbitration when it pleases us and reject it when it does not—just because we think we might lose. If the arbitration method is to become useful at all it must involve obligations by both parties to submit questions when they would rather not submit them. To make a contract under which we are able to do as we like is to make no contract at all.

I do not contend that such treaties would at once render war utterly impossible, but I do contend that they would make war much less probable between the contracting parties, that they would immediately suggest the wisdom of such treaties between other nations, and that when these treaties become common among the more important nations of the earth there will have been formed a mighty alliance for peace which cannot easily be broken—and with all my heart I hope to see that time.

WASHINGTON, D. C.

The Income Tax

BY WILLIAM LYON PHELPS, Ph.D.

LAMPSON PROFESSOR OF ENGLISH LITERATURE AT YALE UNIVERSITY.

THERE are many people who believe that an income tax is bound to come in America, and await its appearance with that dull resignation characteristic of the attitude of the ultimate consumer toward our lawmakers in Congress assembled. Like sheep led to the shearers they are dumb, while the professional politicians open their mouths. This curious and revolutionary scheme of taking money away from those who have earned it is discussed usually only by legislators and economists; the vast number of those who will have to pay are not considered qualified even to have an opinion, much less to utter it in public. But it might be interesting to consider the effect of the income tax on that huge class of Americans, who are neither poor nor rich, but are just able to support their families on a fixed salary or a fairly regular income. The man on a steady salary does not seem to gain directly during seasons of great national prosperity. He finds his income the same, with its purchasing power considerably decreased. If he were forced to pay, in addition to his living expenses (which already make it impossible for him to save anything but his life insurance), a section of his salary to the national government every year, he would find it necessary to give up, not the luxuries of life, but some of the things his wife and children regard as necessities. He should be pardoned

if he does not welcome the idea of a national income tax with enthusiasm.

Suppose his income were four thousand dollars, with the cost of living steadily increasing. This figure would make it certain that if the income tax did not hit him on its first imposition—I use the word in all its senses—it would on the second or third amendment. Fortunately, his moral character would not suffer, for any temptation to conceal from the taxgatherer the exact amount of his receipts would be overcome by the known impossibility of success. It is quite easy for the inquisitor to discover the exact income of a man on a fixed salary.

The income tax is a great feature of life in England, where the proposition seemed originally not only feasible, but desirable; there being no protective tariff, it was thought that the poor and those of moderate means could buy the necessities of life cheaply in the world's cheapest market, while the rich could support the government out of their superfluous incomes. At first the tax was imposed only on large incomes, and only a small percentage had to be paid in; but naturally enough, with the increasing expenses of national budgets, the range of the tax was steadily widened to cover moderate incomes, and the amount of the tax increased as well. Now every one who has an annual income of $700 must pay the tax, and the percentage is so great that, what with local rates plus the income tax, many Englishmen are forced to pay in taxes seven shillings in every pound, or a little more than one-third of their entire income. Persons, therefore, of moderate means are having a desperate struggle to pay the tax and live, while the condition of the very poor has not improved at all. There is no country in the world that has been more torn by strikes and labor troubles during the past two years than Great Britain. The reason is that it is impossible under the present condition of affairs in England to give workingmen high wages; and the absence of a protective tariff has very little effect on the price of *food*, which is the big item in every poor man's expenses. The poor in England do not receive enough wages to buy a sufficient amount of good food, and the manufactories, railways and employers in general cannot afford to pay them much more than they now receive. Hence constant strikes, struggles and universal discontent, with the black shadow of revolution.

The Englishmen of moderate means with whom I have spoken are not very keen in their support of the income tax as a means of national revenue. They are hard hit.

Altho I do not care to discuss the income tax as a political measure, and have nothing but contempt for the cheap demagogery of some of its advocates, it seems to me somewhat strange that either of our great political parties should have coquetted with such a scheme. From the point of view of Federal control, the determination to centralize as much power as possible in the Government at Washington, to the exclusion of the rights of the separate States, it might be a logical plank in the platform of the Republicans; but on the other hand, the Republicans have always set their faces against direct taxation, believing that the easiest way to raise all the immense expenses of the national government is by high impost duties. All taxes are odious; even the most patriotic citizens do not overvalue their property, except when they wish to sell it, nor do they greet the arrival of a tax bill with a shout of joy. But the least odious way to pay taxes is when they are indirect; when all luxuries and some necessaries cost a little more than they would without an impost. Thus, for the Republican party to abandon the indirect system of taxation for the direct would be a right-about-face in party tradition and party policy.

But this is nothing compared with the situation from the Democratic point of view. The historic position of the Democratic party, and to my way of thinking, its finest attitude as an organization, is its old and firm belief in local self-government. Historically, the party resists strenuously any attempt on the part of the Federal Government to assume powers that belong to the States, or to interfere with the rights of individuals as citizens in States. Every one, by a little effort of memory, can recall the rage of the Democrats some twenty

years ago, when it was proposed by the Republicans to pass a Federal Elections bill, which meant that national elections in the States should be under the supervision of Federal officers. Southern gentlemen dubbed this Republican partisan measure the "Force bill," and they fought it with fury, and finally succeeded in talking it to death in the Senate. The idea of a Federal officer at a Southern polling station was to them intolerable, and they were quite right, it seemed to me, in their fierce opposition. But now we see many good Southern Democrats cheerfully voting to sanction the visit of a Federal officer into every Southern home, an inquisitor who has the right to ask the most personal questions as to the source, nature and amount of every individual's earnings. This has a humor all its own, for not only is the State's sacred right of taxation to be surrendered, but the privacy of every individual is to be invaded by a Federal officer. I suppose some of the Democratic enthusiasm for this arbitrary and dangerous power to be given to the Federal Government is caused by the belief that more Republicans than Democrats will have to pay the piper. But let no man deceive himself. Even if this thing starts as a rich man's tax it will soon cease to be such, and the weight of it will eventually fall on the great army of men and women who have only moderate means, where it may become a burden well nigh intolerable. And if in the future the Republicans should once again endeavor to establish Federal control of State elections, the Southerners who have voted to bring Federal officers into Southern homes would find it difficult to assume their former attitude of pious horror. Nothing is more dangerous than to surrender personal liberty and local self-government into the hands of a centralized force.

In England, every man or woman who owns a little stock receives the dividend shorn of the income tax. The tax is first taken out and the stockholder gets what is left. How will this proposition be greeted by the vast number of people in America who own only a few shares?

I refrain from speaking of the enormous expense necessary to collect this tax, of the amount of fraud and lying that it will cause, for the reasons given above are sufficient to condemn so un-American, so inquisitive and so odious a scheme of taxation.

SEVEN GABLES, LAKE HURON, MICH.

Memory

BY J. J. MEEHAN

I heard a robin sing at early dawn;
A melody that floated from the sky,
A gentle song of other days gone by—
(We heard it once, together, you and I).

I saw the willow send its leaves of green
From swaying stems of yellow, shining gold;
I read once more forgotten tales of old,
As in some long lost manuscript enscrolled.

I heard a winter-prisoned stream break loose.
Far from the fevered haunts of busy men,
Seeking the sea, as each one seeks again
Its own, by hill and dale and silenced glen.

I was a village boy; the lilacs flung
Their scented blooms like attar on the wing:
Sweetheart, you wove an olden, daisy-ring
For me at dusk. . . . I heard a robin sing!

NEW YORK CITY.

"The Sweet Ps"

BY LOUISE DUNHAM GOLDSBERRY

[Mrs. Goldsberry introduced us to "The Sweet Ps" in "We" of December 21, 1911.—EDITOR.]

EAR PATTY:

Just *try* to think of the very nicest anything that could happen.

Yes, ma'am; *I've found Polly!*

Father and I, back in the cryptic innermost of the Kentucky mountains, started for a daybreak ride up-mountain. A once-in-a-day-or-so train of one coach follows the Kinnikinnick River (not a real river, but just a water song downgoing along the track up-going). We really were en route somewhere, waiting at a way station. But when that engine began to announce its immediate "all aboard" and not a passenger, father just tilted his head "Shall we?" and I nodded back "We shall." And Patty, I never *heard* such a—such a—*prismatic* music as that water makes!

Well.

Afterwhile the engine stopped.

We alighted. Right on the cindered track.

Whippoorwills were mourning, and low winds singing like violin strings, and a frog symphony was in full blare, and spring-peeper-piping. And a lovely young moon in a drift of thin clouds was painted on the dark.

The track ended right there; no station, but just a stopping-off. And it seemed a place where dreams were spun; that bowl of sweet earth with its lifting rim of low mountains and talking trees.

Everybody takes in anybody who chances this way. So we went to a house and were made beautifully welcome.

It's a mountain grandiose manner that turns a cabin into a castle and you a lord come riding by.

"Preacher'll be hyar in th' mahnin'," said our host. "He hez seven *ap*pointments; walks, sometimes; sometimes borrys an old hawse and totes his wife."

Well, our ride. I was walking. Found a great, adorable patch of white violets just where the wagon road left creek bed; a whole fence zigzag full. And in scared digressions up the lure of the mountain side, after the arbutus lacing the spring's green sleeves. Didn't *see* any snakes; but awfully scared every time I pulled out a yard of it for fear I *might!*

And only the pine tops were gilded; where the sun had "tangled his wings of fire." And down below it was cool and odorous and still and mystery filled in the day at the dawn.

The wagon had stopped and father had climbed out and the driver dangled over the wheels. And coming down the road out of the green silences were a man and woman. He led a "hawse," one arm about the woman. Her arms were filled with dogwood blooms, the white under and about her face like a picture frame.

Then I saw her face. And she saw mine. And from the man's arms she ran into mine.

"Oh!" she sobbed and laughed. "It's my own Peggy—it's my very own Peggy."

And oh! *Patty!* Aren't sweet girls just *sweet!*

And I could not say one word. Just only hug her and cry. For, oh, Patty, don't you remember? How Polly came to me *that night?* and said, *"Peggy, kiss her one little kiss to take to my mother,"* and you cried because you did not remember your mother?

And presently father said: "Peggy, my dear, might I venture to ask if this lady is one of your twins?"

"Why, of *course*," I said; *"it's Polly!"*

You know father's dear old-fashioned way? Well, he kissed Polly's hand, and Polly's husband and I shook hands and fell in love at once, and we all went back to Polly's house.

Patty, remember Polly's last letter after she married her divinity man before we went abroad and lost her? What she wrote about her "dear home"? Patty O'Neill, it is a three-room log

cabin! On a mountain slope where three mountains stoop and meet! It is papered with newspapers! All the money they have had in eight months is five dollars a month!

Patty, my candy bill is that much, at *least!* And so is yours! And Polly and her divinity man looked almost transparent. Patty, I felt as tho God were too ashamed of me to ever remember my name.

Patty, she is per*fect*ly wrapped up in him!

Once I moaned: "You *poor* Polly!"

Patty, she *shook* me!

ME!

Then I realized it *is* a "dear home"; to her. And I apologized.

And we cried a little in each other's arms, and she sent me into her bedroom to wash my face. And of course I *had* to look all over the room.

On the dressing table (home made, understand) a Testament was open; and marked—Oh, Patty, Patty, marked: "*And taking a litle child He set it in the midst of them.*"

Then I sat down and cried; comfortably, all to my self. What a wonderful, divine, lovely life Polly was living—*Polly.*

Then I went out where she was getting luncheon ready.

"Polly," I said, "do you remember the solemn promise we made to one another—to accept anything we should ever need, from the others?"

I spoke very sternly.

And Polly caught her breath and looked scared and hid her face and lifted that proud chin and said—I b-a-re-ly heard it—"*Yes.*"

Then I laid that open Testament right down on her pie dough.

"Well, then, darling, darling, darling Polly, we never break our word. Don't dare say a thing. We"—then I just cried some more—"We-e w-w-want to help HIM 'in the midst of them.'"

So, Patty O'Neill, it's "up to us!"

"Five cents to the slang box, Peggy"—can't you just *hear* that precious "manners-mender?" Lovingly, PEGGY.

P. S.—I'm afraid this letter *is* a little long.

P. P. S.—She NEEDS everything!

I felt better after I had written it all out to Patty.

But, *Polly*——

Polly found a place for us to board. For I knew Patty would do some perfectly ravishing shopping and try to even-up our blessed account with Polly and descend upon us with the wings of a dove.

I told father. I *always* tell father everything.

And I knew something would happen when father went back to town. Father *loves* a secret. And father went shopping.

So Patty and I spent the summer in Polly's "delectable mountains." And I hadn't felt so like a dear little girl since I put on long dresses.

And we helped Polly to choose a name.

Angela. That was the name we decided upon; and she was to be christened Angela P. and Patty and I to be her godmothers.

Then Christmas Day a telegram came to Patty and to me:

"*Not Angela, but Angel.*"

That was all it said. But, oh, our poor little Polly—our poor little Polly! We could only dress for her that holy thing. Come from its journey from God's hands only to show us the marvel of His making. And we wondered at Polly's strange courage.

He carried the lovely white burden in to her. Laid it beside her. "Little mother," he whispered, "here's your angel." And Polly's baby was put away with the other buds waiting under the snow for a blossoming time—only when they should be at bloom over her, she would still be in slumbering.

Then, one day in town, I encountered Mr. Smith. Buying picture books at a street stall.

We had attended his wedding; and he introduced us to her as the "only ladies who had ever proposed to him." "Isn't that so, kids?" he said to the grinning groomsmen.

And those fatuous young men chorused "*Sure!*"

I said, "Jacob Henry Clarence Smith, *what* did you name the first?"

"Peggy," he said.

"*Oh,*" I said; and blushed. And he laughed. "You blushed just that way the night of the party," he said.

"And the others?" I asked, hurriedly,

"Well, what *would* you naturally suppose?"

"Not truly?"

"But *of* course. So you see, I got them all," he said.

"Slimmy has 'Peggy'; and 'Patty' next," he said. "And Shorty Jones has 'Polly' only," said he. "The laughter, your 'adored president,' came over and laughed with, held something of real heartache under those boys' pearl party-studs. Yes?"

"Oh, no, please," I said, feeling like a guilty wretch.

Then he shouted.

"And what did Miss *Peggy* say, kids?" he said. And I felt so young and party-like and we laughed, and I took him up to Patty's house for luncheon and we had a gay little hour out of dear old college days.

But, indeed, indeed, I could never have said other than "No" to long, pink, nice, good Mr. Alphabetical Smith. *Nor* to Mr. Slimmy Vance.

Patty and I were often in Polly's "delectable mountains" that summer. Polly's little soft songs seemed to have been all sealed to her lips when they kissed her baby to its sleeping. The little log house was not bursting with song this summer as last summer. But so dear, so rich in tender lovingness that Patty and I loved to be there.

And Patty's big Irish cousin would come up for week-ends.

And he did not return to Ireland. And sometimes I'd find him looking at me across a roomfull in a way that set my heart a-saying under its breath—"*Lover? —Lover?— Lover?*"

And after awhile all within me was answering back "*Lover—Lover—Lover.*"

"*And* Patty hasn't found it out," I'd tell to myself.

Then, one evening, I was just song-lipping to myself; just that "bairnie" song:

"Like a bairn to its mither
A wee birdie to its nest."
She loved it so
"For He gathers in His bosom
Witless, worthless lambs like me."

But it was my ain mither's breast I wanted. To be gathered to my ain mither's breast.

And the great galaxy was gleaming beyond the open window, and I wondered if it were Heaven's highway among the many mansions. And I wept —wept—as only the unmothered know to weep.

I thought it was father came behind me.

And I lifted my arms up to him and drew his face down to mine.

And I broke loose from the arms that had for a second lifted me to a man's heart——

It was NOT my father!

It was PATTY'S COUSIN!

"*No—No,*" I cried as I fled.

Patty came in like a whirlwind, some days later.

"Peggy Sweet P, how *dare* you refuse my cousin?" said Patty. "Will you *just* tell me that?" said Patty.

Said Patty: "Now, Peggy, you know you always did give me everything I wanted."

"*Mac*"——I whispered.

"No, precious, not Mac. Mac wouldn't even flirt with the one of us; and *I* had nice eyes, too," said Patty, pensively. "*And* I have not a doubt but whenever a girl angel is mentioned as especially nice, that that dear Mac says, '*But you ought to see Peggy.*'"

I was crying in Patty's chiffons and Patty just loving me, when suddenly she said, dolefully, "An' me needin' a sister that bad you'd think she'd marry him for me own sake, poor man!"

"Patty, if you'd been a man you'd have been a peddler—*or* a lawyer."

"Peggy, isn't he A DEAR?"

"Peggy, do you realize that I—*I*—helped bring him up? Me, myself? Haven't I had the horrors fending off maids? And widows of sorts: the genuine, the occasional, and the thirty-three degree? Then when I learn the very apple of his eye (*one* eye, Peggy; *I'm* the other) is a girl I *also* helped bring up—Peggy, you know I did—wasn't I *always* two years older than you, the whole four years at college? When, I say, I find him rejected *by* a girl I helped bring up, it's discouraging."

Patty wept a tear now and then. Patty turned to the gentleman I had not seen before, at the door. "Well, boy, let's go home. Peggy says she won't!"

"I did not!" I cried hotly.

Patty stared. Patty ran from the room. Some one tip-tilted my chin in the palm of his hand.

Then I looked up.

Then I looked down; it was easier.

And I said: "I don't choose Patty O'Neill to be rejecting my suitors."

"Then you *did* mean it, Peggy?"

"Oh, no, please." (*Where* had I heard that before?)

And then—well, and then!

And after awhile he went away.

And I sat in the dusk; and dreamed. And listened to the flames on the hearth. The sighings of them and the singings of them and the rosy laughings of them. And the trees crooned, out where the night was coming in. And the lamplighter's lamp laced the dusk with silver lacings and on the walls the wind-blown shuttle of the night spun in and out the black arras of the trees and the black weavery on the walls was like musics.

And thru the dusk came a presence ineffable and my beautiful mother's larkspur eyes shone upon me . . . and I knew I had seen her . . . in the ethereal trailings of the dusk and the sighing and the singing of the flames. . . . Patty was very stately, those divine days. Lovely, with a new charm. And her cousin complained that she seemed to consider me as belonging to herself.

"But, *of* course," would say Patty; "you know I did *all* your lovemaking for you," would say Patty.

And Patty's cousin would laugh.

And "*Lover—lover—lover*" his eyes would tell mine and never a word would Patty hear. Just as he love-made before and I heard and not a word would Patty hear.

Sometimes we'd slip off into Patty's room and with curls curled and braids braided, be just two college girls. And talk.

And one evening I asked her right out:

"Patty, you were *so* anxious to have me married—why not marry your own self *as* well?"

"Patty," I asked her, "are you in love and never a word of it at all to me?" I asked her.

Patty sat on the floor and laughed.

"Peggy, you blessed scrap of a dear," she sobbed, for now her head was in my lap and the tears wet on her face like a summer's rain. "I'm in love with you, Peggy," she sobbed.

Now I wondered what Patty O'Neill had encountered in all this world that could hurt her! I could not think of *any* one being *able* to hurt Patty! To look into the gray eyes of her and endure thought of dimming the sweetness of them and dulling the shining and the young laughters of them.

I said, "Patty, could you possibly have fallen in love with a king or so, in the effete old world?"

Patty's sobs strangled in a giggle of utter inconsequence.

"I have," she said; "Oh, I have," she said. "But there were 'objections.'"

I sniffed. "Much you'd heed 'objections,'" I said severely.

"W-e-l-l," drawled Patty, "kings are kings."

"Tell me immediately," I commanded. "If really proper young men, you may have 'em."

Patty looked wicked.

"He was a dear boy. He said he had always intended marrying an American girl. A tall, lovely, gray-eyed, black-haired, sweet American girl. *I'm* tall. *And* lovely. *And* gray in both eyes and black-haired. *And* sweet," said Patty. "So I considered it a proposal. And I told him if I couldn't find an American man with similar intentions, I'd consider it some more," said Patty.

"And are you—*considering?*" I said, in my most inviting voice.

"Peggy, you're inquisitive."

"I am," I said.

"And impertinent *to* your elders."

"I am," I said.

"*I—I—found—the—American,*" whispered Patty, all her fun drowning in another tear flood.

So I gathered her head to my bosom and loved her and petted her and she told me all about him.

And Patty—*Patty*—was in love. Old-fashioned sweet loverly love.

She met him in Zürich where he was spending his last dollars in a post-graduate pursuit after some more capital letters to write after his name. Men have a queer craze for those letters; like a child's charmstring—always a button more wanted. And he was coming back with his string of buttons, later, to be-

gin a career. And they fell in love. Desperately.

"But," sobbed my poor Patty, "he did not *say* a word of love. And I knew he was too proud to ever ask me to marry him. Me, with my money! So I just made up my mind he should tell me he l-l-loved m-me," sobbed Patty, "anyway."

"Did he?" I whispered.

"He did," said Patty.

"Of course," said I, "I'd never *dream* of asking what he said, Patty; but I'm *dying* to know!"

"He said," said Patty, "he said, 'Patty, I adore you! If you were a washerwoman I'd *make* you love me!'"

"What *did* you say?"

"I said 'me great-grandmother was,'" said Patty. Patty laughed. "Now, wasn't that a clever hint to a man that I was *willing* to be 'made' love him?"

"He said he loved me, Peggy—'I can't half do half my work,' he said. 'Could I love him—some day—if he brought me fame—and fortune?' And I said, 'No.' I said if a man could not give me the dear young years of his working for fame I'd not be caring for the tired-out years of his fortune.'"

"*And?*" I said.

"*And* next day he was away. And a letter only has ever come; Peggy, Peggy! just a heartbreak of a one line: *'I'm coming, Patty—wait for me.'*"

"*And?*" I said.

"I wait," said Patty, softly—"*I wait.*"

Patty took to singing again. After our talk. It helps so much to put two hearts to carrying weight; and I knew Patty would find it easier, after she told me. A heartache shut-up is hardest of all and a heartache shared to a friend's heart gathers heartsease.

I think it must have been nearly a year later. I strung my months like jewels; so precious they were; and all my rains fell through the rainbow's transfiguration and I wondered how a heart could hold so utter sweetness of the joy of being a woman. So, though I knew Patty's days were month-long my months seemed but a sunrise to a sun's setting. But about a year, it was. Patty called me up, and said "Come over right away, Peggy," and not another word. So I went over in a hurry.

I believe the room would have shone with the lights out, so shone Patty's face.

He had come. Unannounced. To just tell her he loved her. And *did* she love him—and would she please marry him tomorrow. And "yes," said Patty, *"I love you."* And *"No,"* said Patty, *"not tomorrow—day after tomorrow."*

I curtsied to the gentleman. He bowed low over my hand.

And I looked at my lovely Patty O'Neill. The dear sweetness of her.

"Kings are kings," I quoted.

"Kings are," said Patty.

WASHINGTON, D. C.

Contrasts at Home and Abroad

BY A NEGRO CLERGYMAN

WHAT a good thing it is for us Americans to travel! If we are white we must come back more thoughtful and humble; if black, more hopeful and contented. The white American finds that despite the fact that most men abroad are colored there is no color line whatever, and yet society holds together. The black man finds that America is the best country in the world for him to make a dollar in and that across the ocean is the best place to spend it; for there the dollar accompanied by culture and character opens the doors arbitrarily shut to him in his own land.

A Southern white clergyman, returning from abroad, frankly told his people that they were wrong on the race question, and it was only in America that discount was placed on color, and that they of the South were in opposition to the demands of Christian principle on the race question. A sojourn abroad spent in various lands confirms in my mind this clergyman's convictions, and it

has led me to contrast experiences abroad with those of my native land.

With little difficulty my people secured the money for the expense of my trip, but it was with no little difficulty I secured my passage. First, I wrote to a New York company and immediately there came back not only quantities of literature, but an autograph letter from the manager offering me a certain stateroom by number and also an offer of fifty dollars for a lecture on board. So eager was he to close the bargain that I was requested to wire my acceptance and send the earnest money later. Seeing a color line clause in his literature and desiring to be perfectly frank, I informed him of my racial identity, and at once back came a letter withdrawing his former generous offer because my skin was the color of his hair—brown!

Disgusted with New York I tried Boston, the cradle of abolition. In response to my application with references there came back a beautifully typewritten letter from Beacon Hill. The tone was extremely cordial, and I was most assured that I was most heartily welcomed to all the favors of this company, especially as I was a Yale man. Negotiations proceeded almost to the business point. As it happened I needed to be in Boston, and was urged to call so as to complete arrangements. I felt delighted over being rescued by Boston from the narrowness of New York. I was congratulating our country and my people that they had a Boston. Finally I called, but it was after some embarrassing experiences that I was able to convince the manager that I was he to whom he had written such whole-souled letters. Then it was that I learned the truth of that German proverb—"No rule without its exception"—for the manager began to explain and explain. Of course, he himself had no objections, but they were expecting some clergymen from the South to join the party; and so on. The upshot of it was that a Boston company in sight of the Shaw monument would not take a black man to the Holy Land unless every other man in the party would say he had no objections.

Unwilling to further dicker with such a company I turned from Boston to dear old New York. But profiting by my former experiences I witheld any mention of my racial variety and made my application on the basis of my Americanism. It worked like a charm until the day of my departure. No little confusion of face was caused on the day I was to sail when I presented myself in person at the Broadway office. But it mattered not; for I had my tickets covering my whole trip in my pocket, and I did not propose at that late date to give them up. Of course there was nothing to do but go ahead. What would occur on shipboard I knew not, but with a stout heart I went ahead. To my pleasant surprise a most cordial welcome awaited me on the big cruiser, and as the sky line of New York receded the color line faded with it. For in all my sojourn in many lands I have looked hard but in vain for the color line. The only shadow of it I have seen was that cast by some unreconstructed American whom I happened to meet. But shadows are harmless, and I could smile at them.

Let me here record that the tourist companies who draw the color line in the supposed interest of the Southern whites are doing them an injustice. I met a number of Southern white people in various countries, and they always met me with the utmost cordiality. I recall the case of a Southern white clergyman whom I met in Rome. He and I became most friendly for the short time we were together, and we both parted with regrets that we could not see each other more and talk over the Southern situation. This turned out to be the very man in whose interest I was barred by the Boston company! On the other hand, there was a cranky white woman of uncertain age from New York State who appeared a bit grieved at my presence on the same ship. As fate would have it we met without either of us planning it scores of times covering a distance of some nine thousand miles, sometimes in the same palace, sometimes at the same hotel, sometimes at the same table, the last time in the same meeting where Eastern students gave me a rousing ovation! In Athens I was struck by the fact that the party of the New York

company which refused me held a religious service on Mars Hill, where Paul proclaimed the fatherhood of God and the brotherhood of man, and closed it just a few minutes before I arrived at that historic spot.

But to the contrasts! I was not long abroad before I discovered the fact that it was not only no drawback to be colored, but a great advantage. The colored tourist is the most striking man in any party. He is singled out for the best attention; every one is trying to do something for him. If it is at a hotel he is given the best rooms and locations; if it is a public assembly the audience clamors to hear from him and do him honor. I recall two instances of this last. One was in Syria. I was introduced to an audience of Syrian students, and was given a most interested and enthusiastic hearing. I was invited to speak again, and the hall could not contain the students who clamored for admission. After my second address they urged their chaplain to invite me to fill the college pulpit on Sunday, but I had to go on. The other instance was that in London. I attended a men's meeting at Whitefield's Chapel. To my surprise I was called on for an address. I did the best I could, and when I had finished those thousand Englishmen arose and cheered again and again. I was glad for my people. I could not help but contrast this with the fact that had I been in certain parts of my own land I would have been given a seat in the gallery, if at all.

Time and time again as weary and tired from travel I have entered the door of a hostelry while in Cairo or Rome or Jerusalem or Paris or London or Berlin, and received a cordial welcome from the hand of the proprietor, I have been led to contrast that with experiences at home, when I have heard the lying word, "No room."

I recall an instance in which I sat in an audience in the South to hear Bryan speak. I was tantalized by those sitting around, and, indeed, the young white fellows talked about putting me out, but other counsels prevailed. It was under the auspices of the local Y. M. C. A. I could not help but contrast this with the cordiality with which I was treated by the crowd of Englishmen wedged into Trafalgar Square to witness the coronation pageant. In my own Southland, if a Governor of a State should eat at the same table with me it would upset his political future. In Tiberias I ate at the same table with the Turkish vali (governor), and no one thought anything of it. In Cairo I saw a South Carolinian white man teaching boys of all colors together, and he was honored at home for it. Should he do that in his own State he would be tarred and feathered.

We Christians look down on the Mohammedans, and yet the followers of Mahomet have done some things we have not yet attained unto. They successfully control the drink traffic, and with millions of people of all colors there is absolutely no color line in the Mohammedan realm. Black and white, yellow and brown, are all equal in the Mohammedan mosque, school, home and state. In the Selamlik at Constantinople I saw a jet black man among the imperial guards to his Majesty, the Sultan.

Cairo is one of the most cosmopolitan cities in all the world. One meets all sorts of contrasts in its streets, from the dromedary to the automobile, from the blackest Sudanese to the whitest European—and yet there is no color line in Cairo. To see black men as conductors on street cars, motormen, business men, office-holders, and the like, violently contrasts with American experience. One is forced to the conclusion that the color line is not only a distinctively American practice, but wholly unnecessary and essentially vicious.

On Southern railways negro passengers in Pullman cars are not expected to respond until all the white folks have satisfied their palates. On my recent journey from London to Liverpool I could but note this contrast as I responded to the call for luncheon together with other passengers. But when a Yankee started to sit opposite me and recognizing my complexion quickly changed to another table, I began to realize that I was headed toward my own, my native land.

But notwithstanding her color line, her narrowness, her oppression of my people, with all her faults I love my

country still. Everywhere I went I was proud to say I was an American. I come home with a renewd feeling to work to make our country worthy of that high reverence with which she is everywhere regarded.

But I was ashamed to tell the people abroad how our country treated my people. And I never did! I love my country too well to speak of her faults abroad. I am American to the core, and of all the flags unfurled in all the world, I believe the stars and stripes the most glorious. Under this glorious ensign we shall yet beat the color line to a frazzle, even if it takes a whole century.

The Chinese Republic

BY DR. SUN YAT-SEN

[At our request, the Rev. Dr. Gilbert Reid, the distinguished independent missionary, visited Dr. Sun in behalf of THE INDEPENDENT. The remainder of this introductory note is from Dr. Reid. He says:

"The character of Dr. Sun Yat-sen, first President of the Provisional Republic of China, and his work in bringing about a revolution against the Manchu Dynasty are fairly well known by the general public in Europe and America, as well as in China. His views concerning the Chinese Republic, and his attitude towards questions of the day in bringing about the development of China, and winning for her a place of equality among the nations of the world, are only slightly known, and anything that can be done to secure an expression of opinion from Dr. Sun on these matters will, I am sure, be welcomed by intelligent observers of conditions in the Far East, and especially by those who believe that a republic is the best form of government for all countries.

"For a long time I have had great admiration for Dr. Sun, and this in spite of the fact that personally I am opposed to all bloody revolutions, and am in favor of agitation thru the application of truth, argument and reason. My admiration for this great revolutionist has been due to the fact that he has been straightforward, persistent, courageous and consistent, taking no position under the Manchu government whilst seeking its overthrow. His purposes have been known for years to the government authorities, and in the face of danger he has held on his course without wavering or fear. The sudden revolution reached a successful conclusion largely thru the plans which have been well laid by this young man from the Canton province. His conciliatory spirit and his magnanimity in securing the abdication of the throne and the end of the Manchu Dynasty have placed him high above his fellows in the esteem of his countrymen and of foreign residents in China.

"During a visit of Dr. Sun to Shanghai, I took the opportunity of asking him to express his views for THE INDEPENDENT concerning the Republic, and concerning the present political situation. He received me courteously, but disclaimed any right to speak authoritatively on these matters." The following is a record of the interview.—EDITOR.]

AT present I am more interested in the social regeneration of my country than I am in the questions of party and politics. Having finished the task of bringing about a political revolution, I am now devoting my thought and energies to the reconstruction of the country in its social, industrial and commercial conditions. I have seen enough of the discord between capital and labor in Western countries, and the misery that besets the multitudes of the poor, that I am desirous of forestalling such conditions in China. With industrial development there will come in an increase of manufacturing, and with this change of conditions there is a danger of widely separating the working classes and those who possess the capital. I wish to see the masses of the people improved in their conditions rather than to help a few to add power to themselves until they become financial autocrats. China thus far has had a large middle class, and we have been free from many of the social defects of prosperous nations in Europe and America. There is need today of developing our own great resources, of bringing in new ideas to the predominant farming classes of the country, and of establishing new industries which will help to keep in circulation our growing capital, and so be ready to give prompt relief to the unfortunate in times of flood and other calamities. These are the questions which now engage my attention, and I am hopeful that

something may be accomplished for the good of our people.

I am asked if I have any objection to stating my opinion as to whether a republican form of government is really suited to the Chinese people?

It has been a part of my plan, not merely to bring about the overthrow of the Manchus, but to bring about the establishment of a republican form of government. Democratic ideas have always prevailed in China, and there is no reason why they should be handicapped by a monarchical form of government. The Chinese are not only peace-loving and orderly, but they are imbued with the idea of choosing their own representatives in managing their affairs. All that is needed is to carry out this idea and to meet this wish by having representatives at the national capital and in the provinces who represent the people, and, being chosen by the people, will work for the best interests of the people. The difficulties which we are now meeting in constructing a republican form of government which is best adapted to the wide area of our country and to our vast population are unavoidable, but I am sure no other form of government will again be established in China. The Republic of China is here to stay.

In reply to the question whether a party government is an essential part of the Republic, I would say that in China as in all other countries, whether the government is republican or monarchical, parties always exist, and the direction of the government changes from one party to another. China, too, has already begun to have her parties. In fact, there are too many parties and societies, and it would be better if they could combine into two or three strong parties. The definite policy of each party will be determined as the years go by.

In view of the danger in having parties during the present Provisional Government, and the fear that persons will be more zealous for their parties than for the Republic, and so weaken the efforts at establishing a republican form of government, my own wish is that all parties should concentrate their efforts on thoroly organizing the new government and securing recognition from other governments. After the Provisional Government has ceased, and the first president of the republic has been chosen, it will then be safe to organize into parties. I am in favor of having the executive officers responsible to the national assembly, as in nearly all the European countries. Under this system place must be given to parties, and party rivalry is unavoidable. Just now I recognize that we should all ignore our differences and help to unite all parts of the country. Since I retired in favor of Yuan Shih-kai as President of the Republic, I have done all in my power to support him and to recommend unanimity of action. I know the danger that would come to the country from discord, and so far as I have any influence I will use it for the unification of the country, the welfare of the people and development of our resources.

[Ex-President Sun Yat-sen gave expression to these views with some reserve, as he did not care to appear in print at the present time. His views are therefore all the more of value.

These views are significant, as being uttered at a time when party rivalries in Peking had caused the rejection of the Cabinet list proposed by the Premier, Lu Cheng Hsiang. The radical element seemed bent on the ruin of the very republic which they had fought to establish. One hope in the midst of the political confusion is found in the moderating influence of ex-President Sun. His self-effacement deserves the praise of men. Being the leading spirit in the revolution, his wishes are respected by all the revolutionists, who now form the party called "Tung Meng," or Union League. Their obstruction to the government action of Yuan Shih-kai and his Premier, will be prevented from working disaster, because Sun Yat-sen is at hand to decide the determining move. As an illustration, during our brief conversation, he suggested General Li Yuan Hung, Vice-President of the Provisional Republic and Military Governor at Hankow, as the best man for Premier and to form a Cabinet. And yet General Li is the head of another party from that of Dr. Sun and his friends. Personally I would recommend Dr. Sun himself as Premier, at least if General Li is unavailable

For the next few months all attention will be concentrated on bringing to an end the Provisional Government, and on electing the first real Parliament, and the first President. In this time of opportunity for personal ambition, Dr. Sun maintains his modest character, and by moderate but none the less effective methods, helps forward his country to the attainment of republican ideas, contented to remain a private citizen.—GILBERT REID]

SHANGHAI, CHINA.

The Congressman's Secretary

BY W. J. GHENT

[As secretary to Mr. Berger, the first Socialist Congressman, for the first fifteen months of his term, Mr. Ghent was brought into close contact with a number of secretaries and Representatives and can speak with full knowledge of his subject. Mr. Ghent has been a frequent contributor to THE INDEPENDENT and is the author of "Our Benevolent Feudalism" and "Mass and Class."—EDITOR.]

A CONGRESSMAN'S secretary is a public official whose salary is paid by Uncle Sam, but whose appointment and tenure of office depend solely upon the Member of Congress for whom he works. No civil service rules affect him, and neither Senate nor House confirms or rejects his appointment. He is a Treasury-paid personal employee.

He is supposed to draw $1,500 a year. There is no doubt that this amount of salary is always drawn. None of it is ever permitted to lie in the vaults of the Treasury. It goes, however, direct to the Representative or Senator, and in the majority of cases there is no telling what happens to it afterward. In the first place, there are not as many secretaries as the innocent public imagines. During the last winter, when an attempt was made to form a secretaries' club, the House Office Building was thoroly searched for *bona fide* secretaries. The statement was made at the time that only 185 could be found. The figures seem incredibly small, and, indeed, estimates of the number, running all the way from 200 to 250, have since been given. But as there are 394 members of the House, even the topmost estimate shows a rather startling discrepancy. Of course some of the Representatives may have had their secretaries temporarily stationed at home on political service. A few secretaries may have been ill at home. But making all allowances, there is plenty of evidence that a good many Congressmen pocket Uncle Sam's $1,500 and say nothing about it.

Sometimes the statesman pockets only part of it. Either he has a secretary whom he pays less than the statutory wage, or else he dispenses with a secretary and merely employs a girl or young man as stenographer and typewriter. When the people back home hear of an instance of this kind they sometimes take it upon themselves to retire the statesman. Such an instance occurred in the election of 1910, when it was discovered that a certain Pennsylvania Representative had compelled his secretary, a young woman, to divide her salary with his spendthrift and indolent son. The matter was made a campaign issue, and he was defeated for reëlection. It is pleasant to record that the new Congressman promptly reappointed the young woman at full salary.

Attempts have been made at various times to get the names of secretaries on the pay-roll of the Sergeant-at-Arms, so that they could be paid direct and in full, but these attempts have always been resisted. The statesmen evidently want the disposition of this money themselves. There are enough of them who feel that they are entitled to it, or to at least to a part of it, to prevent any change in the present manner of payment.

Other secretaries—tho not many, I am told—receive higher salaries than the statutory amount. The increase must come, of course, from the private means of the Congressman. I have heard of a secretary receiving as much as $3,500 a year and of another receiving the entire Congressional salary of his well-to-do employer. It frequently happens that a secretary is of invaluable service to his Congressman. Often he has more education, more information, more system in handling things, a better memory, a larger capacity for work and a greater facility of expression. Such a secretary will handle all his employer's correspondence, gather the necessary data and write his employer's speeches, public statements and interviews, and even advise him how to vote, leaving to the other member of the team the comparatively easy job of "bluffing" the country and his constituents into the belief that he is a great and a busy man. A secretary

of this sort ought to receive a considerable part of his employer's salary. That, as a matter of fact, he generally receives only $1,500, while the Congressman receives $7,500, with mileage and stationery allowances and the franking privilege in addition, seems a bit unfair. But that is the way recompense is arranged in this capitalist world.

Congressmen are supposed to be rather prodigal fellows—and perhaps most of them are. The fact that there is frequently no money for a secretary may be generally due to extravagant personal expenditures, but often it is due to an extreme degree of thrift. Amos J. Cummings used to tell the story of a fellow Representative who sat tight in his seat for two years, never spoke a word, never wrote a letter and never spent a cent that he could save, and who retired at the end of his term with most of his salary. A more recent instance concerns a business man who had not been particularly successful in a material way. Some eccentric turn of fortune elected him to Congress. He did not expect a reëlection, and he therefore resolved to make the best of his two years' incumbency. He purchased and had brought to his office a folding cot, which he could conveniently hide away in his cabinet (couches, for obvious reasons, are not permitted in the House Office Building), and he had a bottle of milk delivered daily. From time to time he brought in cheese and crackers, and on special occasions a sandwich. Here he lived and slept and dined and saved money. His living expenses came within his surplus of mileage allowance and his stationery allowance, and he was therefore enabled to save not only his salary, but his allowance for clerk hire. With no receipts from any other source than the Government, he was enabled to retire at the end of two years some $18,000 wealthier than when he came in. In his scheme of things there was no room for a secretary.

As there are all kinds of Congressmen, so there are all kinds of secretaries. There is the young man or young woman who is little else than a good stenographer and typewriter and who does his or her work only under the dictation and direction of the Congressman. There are many of the more capable sort who handle a good deal of the office work without consulting their employers. Among these are the so-called professional secretaries, who have been in Washington for years, who have worked for different Congressmen and who know thoroly the routine duties of the job. There are the specialists also, who have devoted their time to a particular question, such as patents, pensions, appropriations or the tariff, altho these men are more likely to be found in committee clerkships than in secretarial positions. There are also the secretaries who are valuable in political work, who know conditions in their employers' districts, who are experts in keeping up and repairing political fences, but are of little use in other respects. Finally there are a few who combine all or most of the qualifications for an expert secretary and who sometimes draw salaries fairly commensurate with their abilities.

The efficient secretary has no time for play. The amount of work done in a busy office in the big white building far exceeds anything the average man imagines. The Senate and the House may filibuster and waste time in their sessions, but all the while, back in the offices, a steady grind of work goes on. There is a flood of letters to attend to, petitions and memorials that must be considered, complaints of a thousand kinds that must be investigated, files that must be kept, facts and figures that must be searched for, and bills and resolutions that must be drafted. Pension claims alone in some offices require the entire time of a secretary or clerk. There are always cases arising which necessitate letters or visits to the departments. To satisfy the demand of constituents for public documents often keeps an employee busy, and it is no slight task at times to find or obtain the particular publication wanted. Nearly every Congressman who takes part in the debates has at least some of his speeches separately printed, and the distribution of these oratorical efforts is anything but a light task. The distribution of seeds and of Farmer's Bulletins also means much work. Often an office will be filled for a week or more at a time with

girls addressing letters, documents and packages.

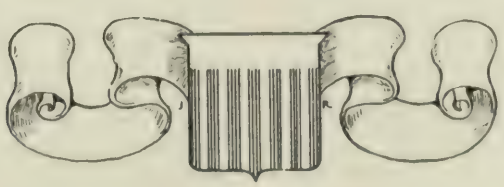
The innocent public is unaware of how much of this work is done by or under the direction of the secretary and how little by the Congressman. If the Congressman is afflicted with incompetence or laziness or egotism or with that vainglory which prompts him to attempt to shine in all the parliamentary debates, all this work falls on the secretary. If the statesman is incompetent, he does not know what to do with the tasks in front of him; if he is lazy, he of course avoids all the routine labors of his office; if his egotism is of a particular type, he considers this work beneath him and fit only for an employee; while if, in his desire to preen his oratorical feathers constantly, he gives his time to the debates, he has of course little time left for his office.

It thus happens that the efficient secretary is often, except for "floor work" in the House or the Senate, much more the Congressman than the individual elected. He handles all the mail, reads it, studies it out and replies to it. He digs up the data and drafts the bills and resolutions to be introduced. Not infrequently he writes his employer's speeches, tho the existence in the city of several bureaus for furnishing Congressmen with ready-made oratory at moderate cost enables the considerate employer to relieve his secretary of this task. He takes up cases with the departments, he searches high and low for documents for the many importunate correspondents, and he studies the various bills introduced and reports presented so that he may serve both as information bureau and as counsel to his employer.

Of course all that he does is done in the name of his Congressman. His first and last lesson is self-effacement. He has no name. When he visits a department he is merely "Mr. Blank's secretary." When he dictates a letter he does so in the first person, but the signature which he places upon it is either his own imitation of his employer's autograph or else a rubber-stamp copy of the original. Of the many hundreds of thousands of humble folk thruout the country who proudly carry about with them letters bearing their Congressman's signature, very few of them ever so much as suspect that neither the letter nor the original which drew the reply was ever seen or heard of by the statesman himself.

A Congressman must of course pose to his constituents and to the world as a great man and a devoted public servant. He must make each constituent believe that he has that individual's personal interests and wishes at heart. His continuance in office depends largely upon the success with which he can maintain this illusion. He must, therefore, pretend that everything done by or thru his office is his own personal and unassisted performance. Once in a while a candid statesman will, in an impersonal way, make some modification of this pose. On the floor of the House, a year or so ago, a Representative spoke of the secretaries generally as unacknowledged legislators who should be officially designated as Assistant Congressmen and who should be paid approximately a Congressman's salary. Perhaps three or four members of the House have the honor and the good faith to make this acknowledgment of assistance in a more personal way by printing on their letter-heads the names of their secretaries. I have seen two such letter-heads. But the impersonal acknowledgment mentioned above is usually unmitigated buncombe, for it is used in no way to qualify the individual Congressman's pretensions to the credit for all the work of his office. The same Congressman who will make such a general acknowledgment on the floor of the House will, in his individual case, practice all the possible devices to impose upon his credulous constituents a belief in his all-sufficiency and omniscience.

Few Congressmen, it may be said, are heroes to their secretaries. There are, of course, cases of sincere attachment between employer and employed, where admiration and respect on the one hand are met on the other hand by a grateful recognition of invaluable assistance. These cases are, however, exceptions. The close view which the secretary has of his employer often breeds disrespect, if not contempt. It is one of the paradoxes of democracy that the qualities which usually make for political success



are not the qualities which make for political efficiency. The person who can persuade the people to elect him is often about the least fitted man in the district to perform a Representative's duties. Self-assertion, self-laudation, the power to impose upon a credulous public, to harmonize antagonisms and to placate disgruntlement are practises and qualities which win victories at the polls, but add very little to the efficiency of a legislative body.

In frequent cases it is just these qualities in his employer with which the secretary must come in constant contact, while the missing qualities he must himself supply. For, after all, tho self-advertising may win an election, it must be complemented by some degree of service—and in such cases it is the secretary who must do the work. But however excellent the character, or great the amount, of this work, he must see it appropriated by another without credit to himself. He must often dwell in the constant atmosphere of bluster and swagger of the statesman who employs him. He must hear boasts about "*my* bill" and "*my* speech" and "what *I* did" and "what *I* am going to do," by one who does little else than boast and swagger. In other cases there is less bluster, but a self-complacency, which tho less assertive, is all the more assured. In no case is there candid and public acknowledgment of the value of the secretary's services. The efficient secretary must therefore not only bear daily witness to the appropriation of his work by his employer, but he must also, if he be faithful, play a part in the game and contribute to the pretense. That generally he finds the work interesting and even fascinating may be true; but it is also true that every instinct of manhood in him rebels against the false position in which he finds himself. When, therefore, you find yourself in the presence of a tired and disillusioned secretary, and in a confiding moment he whispers to you, "My boss is not only a jackass but a faker," be assured that he speaks from a full heart, a profound experience and a love of truthful utterance.

May not the secretary himself sometimes overrate his own performance and depreciate that of his employer? Very likely. But at least he cannot voice his opinions aloud. In no office is there room for more than one pretender to omniscience, infallibility and tireless industry. There are, of course, plenty of secretaries of very moderate abilities. There are quite as many Congressmen of like grade. But the Congressman who cares for his job is usually shrewd enough to employ an assistant who can make up for his own deficiencies. Without this assistance he would often make of himself a most sorry spectacle. In the general run of things, therefore, the secretary's estimate is more likely to prove correct than the Congressman's.

Under Socialism, a state of society wherein we expect to see a reversal of much of what now prevails, we would rightly expect to find many of the present secretaries in Congressmen's places. We would not expect, however, to find many of the present Congressmen in secretaries' places. Few of them could fill the bill.

WASHINGTON, D. C.

Literature

The Mechanistic Conception of Life

THE presidential address of Professor Schäfer before the British Association for the Advancement of Science last week has drawn public attention again to the question of whether the phenomena of life can be explained by physical and chemical laws. The view that such an explanation is adequate has been most ably advocated in this country by Professor Jacques Loeb, and the general reader will find his latest volume, *The Mechanistic Conception of Life,** very useful in understanding both the theory and the experimental evidence which tends to support it. For Professor Loeb, unlike many mechanists, does not waste his time in fiery denunciation of metaphysicians and vitalists or in *a priori* argument that life *must* sometime have originated from inert matter or in vague suggestions as to how it *might* possibly have originated. Instead of this easy and to some minds attractive occupation he devotes himself to the harder but more profitable task of proving by experiment what are the actual causes of the behavior of living beings. This work he has carried on continuously for many years, at first in the University of Chicago, later in the University of California, and now in the Rockefeller Institute of New York.

Professor Loeb not only believes in abiogenesis as an occurrence in the past, but sees no reason to think that the artificial production of living matter is beyond the possibilities of science. In the proof of this, as we might put it, he has so far got only half-way; that is, he has succeeded in dispensing with the male cell, but not with the female cell in the little marine animals with which he has been experimenting. If the eggs of the sea urchin are dipt into sea water containing a trace of butyric acid and then into a solution containing free oxygen it develops into a larva just as tho it had been fertilized by a spermatozoon. Pricking the eggs of a frog with a needle will cause it to develop into the tadpole stage.

But he finds it possible to control by physical or chemical means not merely the processes of reproduction, but also the conduct of animals. A host of little crustaceans are swimming about in every direction in a glass jar. Drop in a little soda water and they all turn toward the light like magnetic needles toward the pole. This heliotropism Dr. Loeb explains on the theory that the light acts on sensitive substances on one side of the animal and so develops an unequal amount of muscular activity, which turns the animal until the direction of the light ray is along its axis of symmetry, when, if it moves, it must swim forward toward the source of light.

He would explain in a similar way all forms of animal behavior, even the highest, and does not hesitate to treat psychology and ethics as branches of physiological chemistry. On such a point as this the reader will prefer the author's own words, so we quote in full the closing passages of the address delivered before the First International Congress of Monists at Hamburg, September 10, 1911, and forming the title essay of this collection:

"Our wishes and hopes, disappointments and sufferings have their source in instincts which are comparable to the light instinct of the heliotropic animals. The need of and the struggle for food, the sexual instinct with its poetry and its chain of consequences, the maternal instincts with the felicity and the suffering caused by them, the instinct of workmanship, and some other instincts are the roots from which our inner life develops. For some of these instincts the chemical basis is at least sufficiently indicated to arouse the hope that their analysis, from the mechanistic point of view, is only a question of time.

"If our existence is based on the play of blind forces and only a matter of chance; if we ourselves are only chemical mechanisms—how can there be an ethics for us? The answer is, that our instincts are the root of our ethics and that the instincts are just as hereditary as is the form of our body. We eat, drink and reproduce not because mankind has reached an agreement that this is desirable,

*THE MECHANISTIC CONCEPTION OF LIFE. Biological Essays *by Jacques Loeb, M.D., Ph.D., Sc.D.* Chicago: The University of Chicago Press. $1.50.

but because, machine-like, we are compelled to do so. We are active, because we are compelled to be so by processes in our central nervous system; and as long as human beings are not economic slaves the instinct of successful work or of workmanship determines the direction of their action. The mother loves and cares for her children, not because metaphysicians had the idea that this was desirable, but because the instinct of taking care of the young is inherited just as distinctly as the morphological characters of the female body. We seek and enjoy the fellowship of human beings because hereditary conditions compel us to do so. We struggle for justice and truth since we are instinctively compelled to see our fellow beings happy. Economic, social and political conditions or ignorance and superstition may warp and inhibit the inherited instincts and thus create a civilization with a faulty or low development of ethics. Individual mutants may arise in which one or the other desirable instinct is lost, just as individual mutants without pigment may arise in animals; and the offspring of such mutants may, if numerous enough, lower the ethical status of a community. Not only is the mechanistic conception of life compatible with ethics; it seems the only conception of life which can lead to an understanding of the source of ethics."

Romain Rolland

THE INDEPENDENT has done homage to the great talent of M. Romain Rolland, one of the most solid of contemporary novelists.[1] Evidently he is, too, appreciated in his own land, for, just as we finish reading a tribute to his work by M. Retinger,[2] we find a little volume of *pensées* piously selected from his "Beethoven," "Michael Angelo," "Tolstoy," "Musiciens d'Autrefois" and "Jean-Christophe."[3] In this one-man anthology the essential quality of M. Rolland receives emphasis; his quality as a thinker. Brunetière remarked that the character of instruction was one of the vital traits of French literature. In Germany, adds our anthologist, a writer writes for himself; in France, that he may be read and understood. And Romain Rolland himself has confessed: "When a Frenchman has ideas, he wishes to impose them on others. When he hasn't any, he wishes to do it, just the same."

This is a wittier saying than most of those culled from the various writings of the author, chiefly from the massive volumes of "Jean-Christophe," and published in a book so small that it fits pillow or pocket.[4] Rolland is, as an author of precepts, no equal of Senancour, Joubert, Amiel or Anatole France —even tho his thought may be found much less relaxing. To compare him with Pascal—but no!

Yet we have the word of his editor, M. Alphonse Séché, that he is a moralist before he is a romancer, critic or dramatist:

"And, before being a moralist, he is a believer. Not that he belongs to any Church—but because, with his whole being, with his whole soul, he serves Truth."

This is brought out in some of the passages reproduced from Rolland's work, as in the following: "The great enemy is doubt. We can, we ought to be, tolerant and humane. But it is forbidden to doubt what we believe good and true. What we think, we ought to believe. And what we believe, we ought to maintain." And again:

"There is but one heroism in the world: to see the world as it is—and to love it."

It is not surprising that a writer uttering this credo should assert:

"Art is not a vile pasture, open to all vile passers-by. A possession[5] certainly, and the most intoxicating of all. But a possession which is the prize only of an obstinate conflict: the laurel-wreath which crowns the victory of force. Art is life mastered."

According to M. Séché, it has been written of "Jean-Christophe" that the book sums up its author's philosophy in "the exaltation of suffering." And truly. Does not Rolland write: "He who has never been ill has never known his whole self." Now, the exaltation of suffering is, in fact, the Christian doctrine. M. Rolland is, all the same, far from being Christian. "He is a free thinker who has read Tolstoy." Yet M. Séché is satisfied that he reveals a

[1] THE INDEPENDENT, April 13, 1911.

[2] "Romain Rolland is the first of French writers to try to reserve in his novels an equal part for observation and psychology and to wish to give to them a humanitarian significance, an idea, without, however, falling into the *thesis novel*. He seems to me to have admirably succeeded in this."—J. H. Retinger: *Histoire de la Littérature Française du Romantisme à nos Jours* (Paris: Grasset, 1911, p. 316).

[3] "Jean-Christophe" is published in two uncommonly solid volumes by Messrs. Henry Holt & Co.; the "Tolstoy" and "Michael Angelo," too, are accessible in English translations (Messrs. E. P. Dutton & Co.).

[4] ROMAIN ROLLAND: L'HUMBLE VIE HÉROÏQUE. *Pensées choisies et précédés par une introduction par Alphonse Séché*. Pp. 92. Paris: E. Sansot et Cie. 1 franc.

[5] In the French, *une jouissance*, a simple word that is hard to render here, for it connotes both of its familiar meanings: a delight (or enjoyment), and a piece of landed property—*i. e.*, a "pasture."

mystic tendency: "Perhaps he is a deist, a little after the manner of a Rousseau." His morality rests upon three principles: the love of the beautiful, of the good, and of the living. In praise of love he writes that whatever it touches is saved from death; again (reminding us of a beautiful thought exprest in Maeterlinck's "Blue Bird"):

"The surest road to lead us to our dead, the way to see them again, is not to die like them, but to live. They live with our life and die with our death."

If the author of "Jean-Christophe" is an avowed lover of life, he is at many removes from the sickening apostles of the "right to happiness." Above instinct, he enthrones reason. "No one has the right to sacrifice his duties to his heart." The love of humanity transcends self-love. This doctrine is in strong contrast with the teaching of the Genevan deist. The later comer does not teach the perilous lesson that all is for the best in "Nature":

"Have the courage to recognize that Nature being indifferent to good and to evil, and thus even wicked herself, a man can very well be criminal and perfectly sane. Virtue is not a natural thing. It is the work of man: let him defend it! Human society has been built by a handful of those stronger, larger, than the rest. Their duty it is not to let the works of so many centuries of frightful struggles collapse at the hands of the dog-hearted rabble."

Rolland makes stimulating reading, and tho we may not here find space to distribute words of praise and opprobrium for his various sentiments, we may at least offer a few more of his aphorisms. Let the reader decide for himself if this Frenchman's acquaintance is not worth making at first hand.

"Life is what we dream it."

"What he is worth who loves, so much is love worth."

"He who has had the happiness of knowing, once in the world, the complete, limitless intimacy of a lover-soul, has known the most divine joy—a joy which will make him miserable all the rest of his life."

"The great misfortune of the women of today is that they are too free, and not free enough. Freer, they would seek bonds, they would find therein a charm and security. Less free, they would resign themselves to those bonds which they would know no way of breaking; and they would suffer less. But it is the worst situation of all, this having bonds that do not bind you, and duties from which you may free yourselves."

"I do not call heroes those who have triumphed by thought or by force. I call heroes, those only who were great of heart. As one of the greatest among them said: 'I recognize no other sign of superiority than goodness.' Where the character is not great, there is no great man; only hollow idols for the vile multitude; time will destroy them together. Success concerns us little. It is a question of being great, not of appearing it."

"All is good, which exalts life. There is only one enemy—the sensual egoism which tarnishes and dries up the sources of life."

"Sincerity is a gift as rare as intelligence and beauty. One cannot without injustice exact it of all."

"The most beautiful theory has no value except by virtue of the works which it accomplishes."

"The true artist does not occupy himself with the future of his work. He is like those painters of the Renaissance, who joyously painted the façades of houses, knowing that in ten years nothing of their work would remain."

"The highest art, the only art worthy of the name, is above the laws of a day: it is a comet launched across the infinite. It may be that this force is useful, it may be that it seems useless or dangerous, in the order of practical things, but it is force, movement and fire; it is the lightning flashing from the sky; by that it is sacred, by that it is beneficent."

"Music is humanity's dream, a dream of light, of liberty, of serene force. This dream is never interrupted and we have no fear for the future. Our inquietude or our pride often seek to persuade us that we have arrived at the summit of art, the eve of the decline. It has been thus since the beginning of time. In all the centuries men have groaned: 'All is said, and we have come too late.' All is said, perhaps. But all remains to be said."

English Lyrical Poetry from Its Origins to the Present Day. By Edward Bliss Reed, Assistant Professor of English at Yale College. The Yale University Press. $3.

This volume represents the first serious attempt to write a history of the English lyric from its beginning, and as such it is welcome, even if not wholly satisfying. It is easy and pleasant to perceive the scholarship and the taste and the sense of perspective which sustain the execution of the great task, and the conscientious care which has guided its myriad detail. Nor is it difficult to accept, with the writer's own recognition of its difficulties, the conception of the lyric by which he seeks to limit and define his field: "All songs; all poems following classic lyric forms; all short poems expressing the writer's moods and feelings in a rhythm that suggests "the music of song." These things will establish the new book as a useful work of

reference. The author has done a vital service by redeeming the lyrics of the Middle English period from a too narrow confinement within the purlieus of the philologian, and by comparative study he has made it possible to see that in lyric verse, at least, the nineteenth century need not indisputably yield supremacy to the age of Elizabeth. Professor Reed has chosen to treat the history of the lyric from the point of view of expression rather than of technic. Since the lyric is the most individual, the most personal of all literary types, this emphasis upon the subjective element, upon lyric mood and content, tends to force the book into the form of a series of strongly personal appreciations and estimates; and its considerable length—553 pages—will seem to many readers to unfold no corresponding progression of idea. It is a fact that Professor Reed, in his voluminous study, adds practically nothing to our knowledge of the laws of the lyric as a literary type, and his comparative neglect of the technic of the lyric will hardly convince those who find the objective elements in this literary form peculiarly essential, and in fact perhaps the most trustworthy material in which to define literary relationships. Doubtless because of this quality of his fundamental method, the author makes little or nothing of the fact that the lyric meters of the eighteenth century were, as may be illustrated in Dodsley's popular Collection, a defense against the mechanical rule of the contemporary heroic couplet. And from the same cause he fails, not only to emphasize, but even to mention, the metrical originality of Coleridge and Wordsworth. His specific comment upon the technic of "The Ancient Mariner" drifts, in fact, dangerously toward the very commonplace of critical characterization: "The art of the verse, apparently so simply written, the effect of the repetitions, the sudden climaxes, show," he says, "a complete mastery of technic; no one had ever suspected that such possibilities lay concealed in this measure." Professor Reed is, to be sure, at his best in characterizing lyric mood rather than lyric form, but even here one misses the capacity for superbly appreciative phrase that Professor Saintsbury, for example, would have brought to this task. But for the work which he has actually and so successfully done Professor Reed will receive cordial thanks. A remarkably complete and well organized index is not the least of the signs of his careful workmanship.

Low Society. By Robert Halifax. New York: E. P. Dutton & Co. $1.35.

Low Society is a misnomer. To be sure the scene is laid in Barking Town, and the story opens in a retail meat shop with a shawled customer dickering for an infinitesimal scrap of bacon; it is true that some of the characters are vulgar and grasping and muckminded; but there is the life of genuine kindliness, of gentle folk bearing adversity with courage and dignity, the light of a lambent humor playing about semitragic situations, and the refreshment of finding a very real generosity and ideality in an extremely unpromising quarter. George Baversham is so human in his mingled egotism and desperate shyness, the self-sufficiency and much of the harshness and crudity of a very young man, combined with the chivalry and impulsive goodness of a sweet-natured boy. His tiffs with his sweetheart, Selina, are not to be taken seriously; we feel sure that he is acting upon some deep theory of the way to anticipate domestic dissension by proving himself master of the house before he has a house in which to act the benevolent despot. His masculine struttings are simply funny. But George is a gentleman, in spite of the author's implication in the title *Low Society*. It is much better company than we have kept in many more pretentious novels of the season.

The Dew Pond. By Charles Marriott. New York: The John Lane Company. $1.30.

About eleven years ago Mr. Marriott wrote his first novel, "The Column," a Meredithian volume with notable skill in characterization and dialog, but deficient in dramatic reality. The atmosphere of the story was curiously cool; and a sort of passionless idealism, not free, perhaps, from a touch of the morbid, revealed a writer whose imaginative control with life was not yet fully established, but

from whose literary skill we hoped much. *The Dew Pond* is the latest of several successors to that beginning. It is the story of a mismated couple. The wife finds the intellectual companionship, which a practical and unimaginative husband cannot give her, in the society of Basil Coburn, a novelist. The companionship is platonic, and in the hands of Mr. Marriott remains so to the end of the book. But Saintsbury, the husband, long tolerant, becomes at last petulant, and finally makes accusations when the two take a somewhat unconventional but wholly harmless walk in the country. This provokes Hilda Saintsbury to an elopement to an atmosphere of intellectual congeniality in the society of Basil Coburn. She is accompanied by her daughter. The literary skill of "The Column" continues, with some maturing, in *The Dew Pond*. The mastery of dialog is as admirable as ever, if less Meredithian. The play of mind upon mind is complex, and is revealed with subtlety. For these things the book is worth reading. But we are not satisfied. The story lacks dramatic conviction, and is cold blooded; and the unlucky Saintsbury is made to pull the trigger in behalf of a theory of marital relations that has not even the play of passion to sustain its laxity. With much penetration Mr. Marriott has no profound view of the material which he presents. We suspect he never will achieve it.

My Lady's Garter. By Jacques Futrelle. New York: Rand, McNally & Co. $1.35.

Jacques Futrelle, one of the victims of the "Titanic," shows in his last novel the same characteristics which gave him his commanding position as one of the three or four writers of mystery stories whom the public really took to its heart. The Wilkie-Collinsy skill in plot construction, the obviously misleading and yet apparently definitive clues which coerce the reader into adopting explanations which ought to satisfy but never do somehow, and the final solution, which appears so obvious after everything has been explained: these are the features of the story which would have marked it as Futrelle's even if no name had been signed. The plot of the story is wrapt around the theft of that famous garter of the Countess of Salisbury upon which the British Order of the Garter was founded. For a sub-plot there is a love story—or, rather, an entanglement of love stories—which is written with such whimsical humor as to be almost as interesting as the mystery. The love story, too, has an ending which is not a foregone conclusion from the first page; and this is a rare merit, for there are several writers of detective stories who can make an unexpected ending, but few writers of love stories have dared to do this.

A Candidate for Truth. By J. D. Beresford. Boston: Little, Brown & Co. $1.35.

The author of the "Early History of Jacob Stahl" has brought his hero before the footlights again and promises a continuation in another volume. We hesitate a little to apply the term "hero" to Mr. Stahl's timid, oversensitive, well meaning, erratic little personality. Such a phrase seems to fit better the Rev. Cecil Barker, vicar of St. Mark's, who makes the chapters in which he appears the most interesting of the book. Barker is a fisher of men and a gambler in their "futures." He seeks out his congregation from prisons, slums and hall bedrooms, and makes a specialty of dissolute young writers. But for all his life of militant good works and aggressive self-sacrifice, he loses half the results of his labors by his habit of suddenly abandoning his protégés as soon as he loses interest in their life, which occurs as soon as the gambling chance seems to be over and the men he worked so hard to redeem either securely virtuous or finally hopeless. Thus he lifts Jacob Stahl out of extreme poverty and makes him his private secretary for several months, only to push him out on his own resources again with the first job that offered, coupled with a strong intimation that nothing further could be done for so weak and changeable a character. As a result the vicar practically drops out of Jacob's life and out of the book, leaving the pages duller for his absence. It would not be fair to the reader to give away the rest of the plot with all of Jacob's experiments in business, in literature and in love. It is enough to say that while these adventures turn out to be little more than experi-

ments, the cause is not lack of practical ability nor even what the vicar called "indolence." It is not that Jacob could not make a success of himself, for he succeeded in a moderate degree more than once. It is because he is never satisfied with one kind of success, but must forever seek out some new thing; a new line of business to enter, a new book to write, or a new girl to love. It is this inconstancy of will which keeps him forever "a candidate for truth," but at the same time it effectually keeps him from being elected.

Sharrow. By Bettina von Hutten. New York: D. Appleton & Co. $1.30.

This is a characteristic novel of considerable strength, but not of altogether pleasing flavor. A curious sort of transcendental affection for the estate of his ancient family permeates Sandy, the grandnephew of old Baron Sharrow of Sharrow, something subtle and interfused as tho physically inherited from generations of ancestors. It is "the feeling"; at the last it remains the one thing strong enough to nerve Sandy Sharrow to protect himself from intrigues without, and to redeem himself from passions within. His ancient and crusty uncle, cherishing spite against a girl who jilted him in his youth, plots to break the engagement of that girl's granddaughter to his own half-recognized grandnephew, Sandy; and succeeds, by the aid of an unscrupulous but attractive nurse, in doing so. Sandy in purposeless despair accepts the proposal of the nurse to elope with her to Paris. There they live till Sandy discovers how he was duped. Then, deserting the nurse, he wallows in lower depths. At this juncture a messenger from Sharrow finds him with word of the death of his uncle and of the responsibilities which the estate puts upon him. Sandy, who has never lost ultimate self-control in all his wallowing, responds to the call, but first sets out to journey afoot to Rome —not as an act of devotion, but for physical restoration. The return of Sandy to Sharrow introduces new complications. The marriage certificate of Sandy's parents has been lost, and there is much plotting by the peppery Spanish wife of Sandy's brother. Sandy in the end marries the sister of his former fiancée, achieves title to the estate, and the ties which unite him to Sharrow are sealed in the birth of an heir. The story gives plenty of field for the display of seamy character; and it must be said that the author loses no opportunity for the kind of realism which her plot makes possible. She even makes some opportunities. When Sandy's first fiancée, Viola, told her sister of Sandy's intoxication, she did so with tears, "and presently blew her nose on her sister's handkerchief." There is plain talk on sexual matters, which can hardly be said to have educational purpose or artistic value. And there is a hand-to-hand fight between Maria Paz, the Spaniard, and Sandy's second fiancée, in which the face of the latter is badly cut. Nevertheless the story has unfailing interest, and is marked by considerable literary distinction, such as we should expect from the creator of "Pam."

Georgette. By Marion Hill. Boston: Small, Maynard & Co. $1.25.

Georgette is the story of a selfish, vain and cruel woman, who, somehow wheedles everybody, including the reader, into condoning her faults because of her charm. She is a vivid young actress, broken down from overwork, who goes to rusticate and recuperate her shattered nerves in the idyllic peace of a farm in the Pocono Mountains. The people there are of Dutch ancestry and have the mixture of placidity and passion which puzzles the student of Dutch characteristics. "Rache" and "Horry" Dornblazer are of a finer type than their neighbors, or, at least, a more cultivated type. There are three delightful children at the farm, which comes near being an Eden, with Georgette acting the double role of Serpent and Forbidden Fruit. She is perverse, provoking, fascinating; and the silent farmer who sits up of nights to read Shaw and Schopenhauer falls into the net spread for him. His wife, Rachel, is a beautiful, capable, motherly woman, who has the reader's sympathy from the start, and, at the last, gains Georgette's. The children — Pauline, Rosine and Baby Horace — are worthy of the author of the "Pettison Twins," who knows how to

make the small people of her books life-like and interesting in even greater degree than the grown-up people about them, and we would willingly hear more of Rosine, whose impulse was to deny every statement with a "tissunt" as sturdy as her dimpled Dutch legs, rather than to go back to New York and to the stage, as we do in the closing chapters.

The Street Called Straight. By the author of "The Inner Shrine." New York: Harper & Brothers. $1.35.

Can a modern young woman have two selves? Not in the psychological sense of a disassociated personality, but a conventional self and a real self; one quite calmly in love with and ready to marry an English colonel and the other unconsciously in love with a generous and Quixotic lover, who sacrifices his fortune to save her father from arrest? Olivia Guion, in *The Street Called Straight,* is just such a young woman, so calm and self-assured thruout that her alleged suffering does not affect us poignantly. The hero is unusually and refreshingly good. Born in China, the son of missionaries martyred for their faith, as Olivia says: "You see, he has goodness in his blood. There's no reason why that shouldn't be inherited as much as—as insanity, or a taste for alcohol." Certainly; why not? The author, Basil King, has in this novel improved upon "The Inner Shrine," but not upon its successor, "The Wild Olive."

Mary Pechell. By Mrs. Belloc Lowndes. New York: Charles Scribner's Sons. $1.30.

That an upright business man may be worse than a criminal, under certain conditions, would seem to be the thesis of Mrs. Belloc Lowndes's latest story, *Mary Pechell.* Aside from the ethical question of how much may be forgiven to a man who had committed a crime, concealed by a great company to save its own repute, and who has made some sort of secret reparation for it, *Mary Pechell* is an interesting love story, and the character of the heroine is wholesomely natural and admirable. The technically honest man is hard and hateful, like the Prodigal's elder brother, and we do not wonder at Mary's preference for an erring, but lovable husband.

Literary Notes

....A biography of *James Fenimore Cooper,* by May E. Philips, will be published this fall by the John Lane Co.

....Messrs. Lippincott announce for publication *An American Glossary,* in two volumes, by Richard H. Thornton, of the Philadelphia Bar: a work which has, in England, received complimentary notice from the periodical press.

....Coincident with the news that Ohio has abolished capital punishment by popular vote comes a pamphlet from the Library of Congress giving references to the most important books and articles on that subject, both the pro and the con. (Washington: Superintendent of Documents; 10 cents.)

....The Board of Education of Newark, N. J., has prepared a course of *Newark Study* in an attractive volume containing the outlines of lessons on the history, government, commercial importance and life of the city, with full library references. It may well serve as a model for local courses in other schools.

....In the Home University Library there is a concise and animated account of the political aspects and entanglements of the Papacy during its six hundred years of temporal power. Rev. William Barry, D. D., the author of *The Papacy and Modern Times* (Holt; 50 cents), is a historical writer of prominence, and was in the English college at Rome when the fall of that city in 1870 brought the temporal power of the Popes to an end.

....John Burroughs has been visited at Slabsides, and elsewhere, by Mr. R. J. H. De Loach, who has since written a book called *Rambles with John Burroughs* (Badger; $1.25) to record how Mr. Burroughs changed the course of his visitor's life, by giving him "new eyes with which to see, new ears with which to hear, and a new heart with which to love God's great out-o'-doors." Mr. De Loach does not escape sentimentality in his record of this transformation; and Mr. Burroughs may in turn pray to be delivered from friends who report his most commonplace remark.

....We have received from the Stanhope-Dodge Publishing Company, of Larchmont, New York, a small volume in the Author's Hand-Book Series, entitled *The Pilot of the Short Story.* It is written by Henry Albert Phillips, formerly of the *Metropolitan Magazine,* and contains an introduction by Matthew White, Jr., editor of the *Argosy.* The book analyzes plot as "the most important element of technic," and is worth the attention of the

practical writer for whom it is designed. Mr. White begins his introduction by stating that: "From my point of view, surprise is the prime factor of the model, marketable short story, at least for American consumption." We duly observe the qualifications, but feel that the statement offers little encouragement for the future of the short story in American literature. (Price, by mail, $1.05.)

....A new biography of William the Silent has been written by Jack Collings Squire. The book claims little in the way of original investigation, but from the purely literary point of view is admirably written to bring out the picturesque and dramatic elements in the career of the great Netherland statesman. The work is well illustrated with portraits, and typographically is a favorable example of the work of what is perhaps the best press in Great Britain—that of the University of Aberdeen. (Garden City, N. Y.: Doubleday, Page & Co.; $3.)

....C. D. Mackellar, author of *A Pleasure Pilgrim in South America*, continued his rambles about the world into the region of Torres Straits, German New Guinea and the Dutch East Indies; and E. P. Dutton & Co. has just published from his pen, *Scented Isles and Coral Gardens* ($5), a rather sumptuous volume elaborately illustrated with photogravures, drawings and color prints. Mr. Mackellar passes rapidly from place to place, with a discursive style that reproduces picturesque characteristics with considerable vividness and personal interest.

....Three volumes of Western pioneer biography review the romance of early California and Oregon. Jeremiah Lynch's *The Life of David C. Broderick* (The Baker & Taylor Co.; $1.50) has passed into a second edition. Mr. Lynch gives a strong portraiture of the rugged California Senator and an able and fair-minded exposition of his relation to State and national politics until his death in the duel with Judge Terry in 1859, on the threshold, it would seem, of larger service to the country. Yet it is possible that his death, in the circumstances, was the determining factor which saved California to the Union, in the Civil War.

....Scribners has just issued *British Poems from "Canterbury Tales" to "Recessional,"* edited by Percy Adams Hutchison, Ph. D., formerly an instructor in English in Harvard University. The volume contains 537 pages, and includes about 360 titles. None of the selections is of great length, but the editor has wisely made it an aim to include, with a few exceptions, only complete pieces; and he has further taken special pains to secure a trustworthy text. There is no statement of the specific purpose of the collection, but the paper, the clear type, and the binding are such as to fit the book either for class use, or for general library purposes. The sequence of poems is chronological.

....English readers have small choice of sources for general information upon Italian literature of any period later than the Renaissance. They will therefore welcome Mr. Lacy Collison-Morley's *Modern Italian Literature*, which gives an account of Italian letters from the seventeenth century to the twentieth. The author finds in the service of literature to national unity a central theme of his book. Chapter XIV, on "Poets, Novelists and Dramatists of Today," contains representative names already familiar to readers in English, and other names that deserve to be: D'Annunzio, Rapisardi, Arturo Graf, Pascoli, Edmond de Amicis, Fogazzaro, Verza and Matilde Serao. (Little, Brown.)

....A collection of letters, documents and other material, chiefly from private sources, relating to the life and activities of General Sherman, to the early years of Louisiana State University, and to conditions existing in the South on the eve of the Civil War, has been edited by Dr. Walter L. Fleming, professor of history, Louisiana State University, and is published by the Arthur H. Clark Co., Cleveland, under the title, *General W. T. Sherman as College President* ($5). The work was originally planned by Sherman himself, in 1889, who wrote that the letters would give "a far better understanding of the private thoughts and feelings of the men who afterward bore conspicuous parts in the Civil War than any naked narrative."

....From the press of E. P. Dutton & Co. comes an elementary handbook of practical oceanography, entitled *The Science of the Sea*. The work is edited by Professor G. Herbert Fowler, of the University of London, in behalf of The Challenger Society for the Promotion of the Study of Oceanography ($2). Illustrations and maps are abundant, and the style takes for granted no previous scientific training on the part of the reader. To all who live by the sea, or who go down to it in ships, the book is especially addressed by the Challenger Society in the hope of stimulating the scientific observation and record of marine data. It is therefore a manual of method as well as a treatise abounding in interesting information. The writer of the chapter on Whales, Seals and Sea-Serpents deals gently enough with the sea-serpent legend to cheer every proprietor of a summer coast resort.

....The proceedings of the Southern Sociological Congress, which met at Nashville, Tennessee, in May, at the call of Governor Hooper, have just been published in a volume of 400 pages for general circulation. The addresses, which make up the contents, center upon child welfare, courts and prisons, public health, education, the church, and social service, negro problems, and the qualifications of the social worker. We notice that only twenty-six pages of the entire book are exclusively devoted to negro problems. Seven hundred delegates attended the conference from fifteen Southern States. The addresses have a representative character that make this volume a useful work of reference.

....Some of the friends of Mount Holyoke College have made a selection from the writings of several generations of undergraduates, which they have published under the title, *A Mount Holyoke Book of Prose and Verse.* Along with numerous essays, sketches and stories, the book contains about sixty bits of verse. Of the latter more than half find their themes in flowers, trees, the sea or other forms of natural beauty. The verse is of good workmanship. It sometimes contains a flash of real observation, and often gives the echoes of older and larger music. The book is published for the benefit of the Mount Holyoke Student Alumnæ Building Fund. Orders may be addressed to Miss Irmgarde Schneider, South Hadley, Mass. Price, $1.35, postpaid.

....A useful handbook and guide in Gospel study, adapted to the needs of both student and general reader, will be found in the *Introduction to the Life of Christ* (Scribners; $1.25), by Prof. William Bancroft Hill, of Vassar College. Canonical, textual, literary and historical questions are carefully and lucidly discussed, and the materials for the life of Christ are examined and characterized. The estimates are usually conservative, but the difficulties are never overlooked and opposing views are freely stated. In a valuable appendix Dr. Hill gives a concise and candid description of the various "Lives of Christ" accessible to the English reader. The book stands alone in the field which it acceptably covers.

....Prof. G. A. Johnston Ross has published in a booklet, *The Cross* (Revell; 25 cents), an essay which first attracted some attention in "The Hibbert Journal." He describes it in the sub-title as The Report ot a Misgiving. The substance of his plaint is that religion today is not serious enough, that sin is too lightly regarded, and that consequently the profounder and more tragic aspects of religious teaching and experience, symbolized by the cross, are neglected to the permanent damage of the Christian life. This is true from the standpoint of the older thinking, but we believe that if Prof. Ross goes deep enough into the philosophic presuppositions which underlie the joyous and hopeful religious spirit of "the younger generation," he will find the very elements he seeks. But they cannot be expressed in the old formulas, and they point to greater practical needs than "a rehabilitation of the doctrine of the Cross," as it has been generally accepted in the past.

....We recently misstated the title of Mr. Arthur Sherburne Hardy's *Aurélie,* just published by Harpers (50 cents). This charming story is one of imagination, touched with sentiment, the principal characters being a small boy and a wooden soldier that tells him (after dark) the story of his campaigns with Napoleon, and his love for the maiden whose name gives the tale its title. The illustrations, in color, are the work of Miss Elizabeth Shippen Green.

....Thomas Holmes, secretary of the Howard Association of London, widely known for his devotion to the problems of housing the poorest toilers of the metropolis, has written a volume of absorbing interest on *London's Underworld* (Dutton; $2.50). Mr. Holmes' work has not the high literary skill of Jacob Riis' *How the Other Half Lives,* but he has even a wider knowledge of the conditions which he describes nevertheless with vividness; and his views upon efficiency in philanthropic methods are worthy of wide perusal. A final chapter of "Suggestions" ends with a presentation of some of the steps that Mr. Holmes thinks necessary in London for dealing with the problems of the underworld:

"First, the permanent detention and segregation of all who are classified as feeble-minded. Second, the permanent detention and segregation of all professional tramps. Third, proper provision for men and women who are hopelessly crippled or disabled. Fourth, establishment by the educational authorities, or by the State, of reformatory schools for youthful delinquents and juvenile adults regardless of physical weakness, deprivation or disease. Fifth, compulsory education, physical, mental and technical, up to sixteen years of age. Sixth, the establishment of municipal playgrounds and organized play for youths who have left school. Seventh, national and State-aided emigration to include the best of the unfit. Eighth, the abolition of common lodging houses and the establishment of municipal lodging houses for men and also for women. Ninth, the establishment of trade boards for all industries. Tenth, proper and systematic help for widows who have young children. Eleventh, thoro inspection and certification by local authorities of all houses and 'dwellings' inhabited by the poor. Twelfth, housing for the very poor by municipal authorities, with abolition of fireplaces, the heating to be provided from one central source; the housing to include a restaurant where simple food may be obtained for payment that ensures a small profit. Thirteenth, more abundant and reasonable provisions of work by the State and local authorities for the unemployed. Fourteenth, a co-ordination of all philanthropic and charity agencies to form one great society, with branches in every parish."

....McBride, Nast & Co. announce *Fourteen Years of Diplomatic Life in Japan,* by Baroness Albert d'Anethan, widow of the late Belgian Minister at the court of Japan. For fifteen or sixteen years Baron d'Anethan held this post, and during the whole of that period the Baroness described day by day the events —historical, social and official—in which she took part.

....Those interested in the question of the initiative, referendum and recall—and that should include all voters—will find the September number of the *Annals of the American Academy of Political and Social Science* (Philadelphia; $1), an invaluable aid to clear thinking and sound knowledge. It contains eighteen articles by competent authorities on different sides of the various phases of the movement.

....An interesting volume is published by Putnam's ($1.25), which deals in a practical way with the principles, methods and aims of the folk plays and other dramatic expressions which are now taking so prominent a place in the schools as a phase of what has been called the New Humanism. Mrs. Anne A. T. Craig, the author, entitles her volume *The Dramatic Festival: A Consideration of the Lyrical Method as a Factor in Preparatory Education.* Part I outlines a typical organization for folk plays in schools and playgrounds Part II suggests other forms of plays and festivals appropriate to the primary, intermediate and final preparatory periods of school life. The book contains, likewise, a number of plays suitable for presentation. Percival Chubb writes the foreword of the book, and Peter W. Dykema, of the Ethical Culture School in New York City, the introduction.

....The edition of the Home University Library could not have chosen a more competent writer than Principal W. B. Selbie, of Mansfield College, to furnish the volume on *English Sects, A History of Nonconformity* (Holt; 50 cents). He is thoroly familiar with the present spirit and aims of the Free Churches, a scholar of broad culture and quick sympathy, tolerant in spirit and possessing unusual ability in point of style. The Nonconformist movement is interpreted as an almost necessary outgrowth of the conflict between the English spirit of freedom and the conservative institutional life thru which it sought expression. The development of the English sects in the face of bitter opposition and for the most part under legal disabilities and oppression is a great tribute to English tenacity and the spiritual power of the Free Church ideal in government and worship. No one can doubt that "their history is a perpetual source of encouragement and inspiration."

Pebbles

"It took me nearly ten years to learn that I couldn't write stories."

"I suppose you gave it up, then?"

"No, no. By that time I had a reputation."
—*New York American.*

I'm weary of country and all that it means,
I'm sick of its atmosphere, sick of its scenes,
I'm weary of horses and chickens and cows,
Of an up-to-date barn and an out-of-date house;
I'm tired of lacking both ice-box and ice,
And drinking well-water has ceased to be nice,
And I long for the city—a flat all complete—
With a delicatessen-store right down the street!

A snug city flat, with a dumb-waiter shaft,
With a janitor not too much bent upon graft,
With a bath and kitchenette showing some class,
And a nice little, neat little stove that burns gas;
With the "movies" near by, and a drug-store at hand,
Oh, who could desire to go "back to the land"
From a right little, tight little flat that is neat,
With a delicatessen-store right down the street!

—*Berton Braley, in Puck.*

The Independent

Entered at New York Post Office as Second Class Matter
Publisher, Clarence W. Bowen
130 Fulton Street - - - - New York

A WEEKLY MAGAZINE FOUNDED IN 1848
One Year, $3.00 Single Copies, 10 Cents

Single copies over six months old, 25 cents. Postage to any foreign country in the Universal Postal Union, $1.75 a year extra; to Canada, $1.00 extra. Subscriptions will be received for other periodicals, and clubbing rates will be granted as low as those offered by any responsible agency.

An order for the change of an address should be received two weeks before the change is to take effect. The old as well as the new address should be given.

For the convenience of our subscribers we will send on receipt of the publisher's price any book reviewed or advertised in our columns.

Volumes of The Independent are completed at the end of December and June, and a full index is furnished free on application. Neat binders holding in book form thirteen current issues will be furnished for 45 cents.

If the numbers comprising any semi-annual volume are returned to us prepaid in good condition with $1.50 we will bind the volume in handsome and substantial half buckram and deliver it free anywhere in the United States.

We are always glad to receive articles for examination, but writers desiring the return of their manuscripts, if not accepted, should send a stamped and addressed envelope. Even so, we cannot hold ourselves responsible for their return. Authors should preserve copies of their manuscripts.

Advertising rates will be furnished on application.

Mutsuhito and General Nogi

THE Emperor had left his adoring subjects and all Japan was in blanched mourning. Mutsuhito had reigned thru the whole Era of Enlightenment. He had seen his island realm, weakest but proudest of the nations, suddenly, marvelously, in his own youth, grasp at and assimilate the arts of peace and war which Western nations had acquired by centuries of research and struggle. He had seen his devoted subjects conquer in war the prouder China and the proudest Muscovy. He was the descendant of the gods. He was reverenced by all Nippon with a real worship. We find it hard to enter into that feeling, for we have ceased to think kings divine, and we do not shrink from vilifying our rulers. But Japan, which has absorbed everything else Occidental, has clung passionately to its simple religion, which is also its patriotism, and which makes its unbroken imperial line more than human. It is not unique, not strange. Were not the old kings of the Nile assimilated with Osiris? Were not the names of the most ancient kings of the Euphrates Valley, the Elder Sargon and his son, Naram-Sin, written with the starry sign of deity? Did not Roman emperors claim to be gods, and did not their petitioners bow their faces before them so as not to be dazzled by the blaze of their divinity? To make a man a god is not so much more than to make him a king, and humanity loves a visible object of worship.

Mutsuhito had past to the company of the gods his ancestors, and all Japan was white with grief, and waited the day of sepulture when the sons of kings and the councillors of presidents, in the line of succession, should come to add their wreaths to the tears and prayers of his people. Last Friday was the day of supreme morning when the sacred body was laid in the tomb with dirges of grief. Four ancient hymns were chanted, made sacred by their use at the obsequies of the gods, his fathers. The first reads thus, and is thus translated:

"Nazukino
Tano Inagarani
Inagarani
Hai motohorow
Tokoro zura."

"Like the pliant ivy that creeps and embraces the Imperial Tomb, we, overcome by grief and sorrow, fall prostrate about the much wept grave."

The others are in the same vein:

"We have followed our beloved ruler as far as this wilderness where the wild growth of reeds and bamboo hides the path; or, lost in this pathless field and unable to fly like white birds overhead, we hopelessly roam about the bushes and woods to follow you."

"We have waded into the sea, not to lose you from our sight: the water is waist deep. We cannot move as we wish; and now seem as helpless as seaweed that drifts with the tide."

"The white birds, which fly not in the water, but over the beach, can follow you; but we who can neither fly like them nor move in the water cannot follow you, and in tears envy the fortunate birds."

Very sad are the dirges. There is in them no syllable of hope or cheer, no "kindly light," nothing beyond after "crossing the bar," such as we add to temper our pain. When will Japan learn the Resurrection and the Life?

The "white birds" could follow, and General Nogi resolved to follow with them. It was he who had commanded the army which had humbled the pride of Russia at Port Arthur. He had bidden tens of thousands of his willing, eager soldiers to lay down their lives for the

honor of their Emperor. Why should not he follow where his master had gone? It is not reasonable, but it is a primitive faith. It is the impulse of love and worship. Many a Christian in the passion of unchecked grief has done as much. Ancient Egypt offered human sacrifices, they tell us, at the graves of their mightiest before they substituted little images for living victims. Savagery has often done it. Jephtha's daughter willingly offered herself in obedience to her father's vow as he went to battle Holocausts of bulls and slaves have honored the burial of kings. Wives have held it an honor to throw themselves on the funeral pyre of their husbands. So felt General Nogi. Why should he live when his sacred lord had died? Why should he not uphold and obey the ancient tradition and give an example which should set his name beside that of Mutsuhito, and be a protest against the neology which was disdaining the sacred Samurai order? Let no one blame him, or doubt his death as aught but acceptable to the God we know, but he knew not; righteous, honest, brave, Samurai soldier, who offered himself up, as he had offered up his two only sons and tens of thousands of other sacrifices to patriotism and duty.

Nor let any one pity or condemn Madam Nogi, who accompanied her husband in this their sacrificial death. She with equal pride had laid both her sons on the Emperor's altar. With him she had set all the glories and victories of Japan to the credit of the Emperor's divine virtue. It was doubly easy for her to die with her husband:

"He for God only, she for God in him."

So they will be for the ages to come the tale of song and legend, the example of loyalty long after their religious and ethical system has been surrendered. Even now while there will be many to praise, there will be few to follow. A Mikado is not a god, nor the son of God, any more than the rest of us, and Japan even now half-unconsciously knows it. The Shinto religion and the Buddhist religion are already being Christianized, and saner beliefs and clearer thought of God, learned from the better Christian faith, are introducing better ideas of religion and morals. It will not long be believed that ancestors must be worshiped, profound as the honor given them will be. All that is noble, brave and self-sacrificing of inherited instinct or teaching will remain fused with and purified by other new-spangled ores, to flame on the forehead of the world's broad civilization; and with Mutsuhito, General Nogi and Madam Nogi will retain endless honor and praise for their needless, mistaken, honorable and heroic death.

The Election in Maine

MAINE'S September elections in Presidential years have not had so much weight in the calculations of political prophets as those of Vermont. Their relation to the following national elections has been irregular. If the Republican party in Vermont had not been divided, its plurality at the polls would have been 21,709, and in past years a September Republican plurality there of less than 25,000 has been followed by the election of a Democratic President. The division gave 37 per cent. of the total to the Roosevelt Progressive party. At the same time the Democrats (comparison being made with the similar election of 1908) gained 4,397, or 27½ per cent. But there was no division of the Republican party at the polls in Maine on the 9th inst. Two years ago the Democrats elected a Governor, carried two of the four Congressional districts, and obtained control of the Legislature. This year the Republicans set out to regain possession of the State offices. Altho Mr. Roosevelt has many supporters in Maine, a division of the party was deferred, by agreement, until after this State election. Republican campaigners were silent as to their national candidates. But the party had sent a Roosevelt delegation to the Chicago convention, had placed a Roosevelt man at the head of its State organization, and had elected another as its representative in the National Committee. If there had been a Roosevelt State ticket in the field it might have been supported, as such a ticket was in Vermont, by 37 per cent. of the Republican voters. The term of the agreement or truce is now ended, and there will be a division at the polls in November.

By a plurality of 3,023 the Republican nominee for Governor was elected, with a Republican majority of twenty in the new Legislature. The Republican Congressmen were re-elected, and one of the two districts lost in 1910 was regained. The majority in the Legislature points to the election of Mr. Burleigh, the Republican primary candidate, in the place of Senator Gardner, Democrat, unless the Taft and the Roosevelt wings of the party fail to agree. The existence of two wings or factions is now to be shown clearly, for several prominent Republicans who worked for the election of the party's ticket give notice that they intend to go on the stump for the Roosevelt national ticket, and there has been preparation for the support of Roosevelt Presidential electors. When comparison with the similar election in 1908 is made, it is seen that the Republican plurality has fallen from 7,653 to 3,023, and that the Republican total shows a loss of about 4 per cent., while there has been a Democratic gain of 3 per cent. In the intermediate election of 1910, however, an election held under exceptional political conditions, the Democratic plurality was 8,753. Comparison of this year's election with that one is, of course, favorable to the Republican party. Much that was lost in the Democratic tidal wave which followed the enactment of the Payne-Aldrich tariff has now been recovered, but by a narrow margin. Still, if an undivided Republican party in Maine now shows at the polls the smallest plurality known in many years, a plurality which is less than half of that which was counted in the September immediately preceding the election of Mr. Taft, four years ago, can any plurality be expected in November next, when the party will be divided?

The effect of division must be considered. In Vermont, the reduction of the Republican plurality (both factions) to 21,709 would have been a warning, if the party had been united, but this warning was very sharply emphasized by the division. In Maine, the margin, with a united party, is small. Will not division surely cause Democratic success there? If 37 per cent. of the Republican votes should be cast for Roosevelt electors, the totals might be nearly as follows: Taft, 44,500; Roosevelt, 26,500; Wilson, 68,000. Those Republicans who intend to vote for Mr. Roosevelt do not expect, we presume, that he will be elected. They must know that they will vote indirectly for the election of Governor Wilson.

Fifty Years of Emancipation

Fifty years ago next Sunday Abraham Lincoln signed the most momentous proclamation in our national history since the Declaration of Independence—the Emancipation Proclamation which abolished slavery and gave freedom to four million slaves. That proclamation made an absolute revolution in our history. The Southern rebellion was abortive for its purpose; but, as when Joseph was sold into slavery by his brethren, what was meant for evil God meant for good. What was intended to perpetuate slavery destroyed it forever, and gave a uniform and free civilization to our country, one which revivified and fortified the Declaration of Independence, declaring that all men should and must be free and equal, whether white or black.

That Proclamation of Emancipation made an epoch and opened an era of national history. It did not immediately give to the freedmen an equality of privilege, and it has not yet wholly done so. There has been since much suffering, much injustice, and still is; but the little negro boy was right who said to General Howard, "Tell them we are rising," and that boy is now President of a Southern State College and a Presidential elector, and his son is an editor of distinction in his race, and promoter of the Emancipation Exposition. The proclamation was followed by tens of thousands of negro soldiers entering the army, not as the negroes of Rhode Island in the Revolutionary War were mingled with the white troops till they numbered half the soldiers of the State, but by regiments and corps. When peace was achieved Congress wisely promised the ballot to black and white alike, and the country added the needed amendments to the Constitution, which we are not yet living up to in all our States, but which are the ideal of a civil condition which is decent and Christian and knows no caste.

Worthily has the penniless, emancipated race met the trust bestowed upon it. The four millions are now ten millions. Multitudes in every State own their homes and are worthy citizens. They are in all lines of business and in all the professions. In every State there are schools for their children, and in a majority of the States they enjoy all their civil rights, and have an equal chance in the common and the higher schools. Fifty years ago very few could read, and in the slave States it was a penal offense to teach them to read; now it is only those of the older generation that are illiterates. What the past half century has done for the freedmen is a promise of vastly greater progress for the race in the next half century. It is easy to count the present wrongs by white men and failures by colored men, but the large view is wonderfully encouraging. Wise and learned men who believed slavery a divine institution declared that the negro could never support himself, that he was less than a man, and that emancipation meant utter, helpless mendicancy, which would put an insupportable burden on those who had been so foolish as to resist the Scripture, which declared that Ham should be a servant to his brethren. Now they know they were mistaken. Now they know that slavery was a fearful burden to the white people, and that it was a curse now happily removed. They would not have it back. They, too, can rejoice with their freedmen in the issuance on September 22, 1862, of the Emancipation Proclamation. They, too, or their sons, now honor the memory of Abraham Lincoln, the Moses of the negro race.

It is often said, and it is true, that the North was responsible with the South for the institution of slavery; and a New England port was the chief center of the infamous traffic which brought negroes from Africa to be sold into slavery. But it was also in the North, where the institution never much flourished, that the crusade against slavery was most insistent. It began early, long before the so-called Abolitionists and the political pressure that elected Abraham Lincoln. In Newport, R. I., in the very nest of the slave trade, the most distinguished theologian of his day, Dr. Samuel Hopkins, preached mightily against slavery; and when, in 1793, he published in two octavo volumes his "System of Doctrines," seldom read now, but which created a school of theology in its day, within the nine pages of subscribers' names, governors, judges, merchants, clergymen from all the country, we find the names of seventeen "Free Blacks" from Newport and Providence, who gratefully gave their scanty dollars that they might honor the man who championed their freedom, and whose books they wished to own, but could hardly read or understand. There is a pathos in the list of names, Prince Amy, Congo Jenkins, Solmar Nubia, Mrs. Obour Tanner, Zingo Stevens, Mrs. Duchess Quamine, Cato Coggeshall, Cato Mumford, Nimble Nightingale and Bristol Yamma. Doubtless some of them were among the suffering patriots of Valley Forge. They were the promise of a mighty host of black soldiers in a greater war, and the forerunners of generations of whom it will not be remarkable that they should be scholars and thinkers, authors and statesmen. It was from Newport that there came to Chicago one of those delegates whom Mr. Roosevelt declared equally worthy with any of a lighter hue. Nothing is too much to hope in the years to come for the descendants of the people whom Abraham Lincoln and the Civil War delivered from the curse of slavery.

A Roosevelt Tariff

THERE was one thing that Mr. Roosevelt, as President of the United States, did not set right. He let the tariff alone.

But if any free born citizen supposes that Mr. Roosevelt did not know what ought to be done to the tariff, he misapprehends and underrates that comprehensive statesman. There is nothing that Mr. Roosevelt does not know. There is nothing within the limits of what is right and worth while that Mr. Roosevelt has not done or isn't doing or isn't going to do when he gets ready. The only things impossible to him are sin and error.

So now, in the fullness of time, Mr. Roosevelt is telling us about the tariff that we are to have when he propounds

a perfect act and "gets it across." It will have no academic taint of free trade, and it will offer no joy to the predatory rich. It will be a strictly righteous and pragmatic tariff, and its bounty will go straight where it belongs, to wit, into the wage-earner's dinner pail.

It would be discourteous, we think, to ask Mr. Roosevelt just now to explain this tariff in detail, and tell us how it will go about its benign performance. Mr. Roosevelt has other good and wise things on his mind, and is very busy. And we have waited so long for a commendable, not to say a faultless tariff, that we don't mind waiting a few months longer. It is enough to know that if Mr. Roosevelt is elected for a third presidential term, he will keep his promise (as his habit is) and give us a tariff befitting an administration in which all things are to work together for good.

Meanwhile, in the pursuit of our own humble calling, we will strengthen the hearts of our readers who are struggling with the cost of living and wondering what incidental betterments they can count upon for themselves under a tariff for righteousness only. Not having the immediate and exhaustive knowledge of those difficult matters that Mr. Roosevelt possesses, we shall use second-hand information, derived from such official sources as the reports of the Tariff Board and of the United States Immigration Commission.

According to the Tariff Board, then, the weaver of men's worsted suitings produced in American mills gets 5 cents a yard for his labor and the manufacturer enjoys a protective duty of $1.02 a yard. Mr. Roosevelt, we presume, will be willing to reduce the price to the consumer by some small figure, say 10 cents a yard, and thereby permit other people, as well as wage-earners, to share in the new distribution. The weaver surely ought to be satisfied if his wages are doubled, or certainly if they are multiplied by three.

Again, according to the same Tariff Board, one of the serge cloths of American manufacture, for women's wear, is protected by an import duty of 49 cents per yard and the labor cost is 10 cents a yard. In this case, none ought to complain if Mr. Roosevelt uses the whole duty of 49 cents to increase wages.

Once more, the report of the Tariff Board on the pulp and news print industry shows that if the wages of all the workers in the pulp and paper mills of the United States were doubled, the manufacturers would still get a profit, at present prices, of $7.75 on every ton of news print paper produced. Knowing Mr. Roosevelt as we do, we feel sure that (if elected) he will see to it that this possible doubling of wages is attended to before the price of paper is materially reduced to publishers like ourselves. Nevertheless, we cherish the hope that he will not entirely overlook our own small claim to consideration.

It would be interesting thus to go thru the list of our major products and to speculate upon the probable apportionment of benefits to wage-earners and consumers in Mr. Roosevelt's schedules. But we must resist the temptation, and call attention to one other possibility that we venture to regard as more important.

All the tariffs that we have had since the Civil War, as everybody knows, were really framed and adopted to protect American wage-earners against the pauper labor of Europe; but, not having had the advice of Mr. Roosevelt, the makers of them did not wholly succeed in accomplishing their main purpose. At least this is our interpretation of the monumental report of the Immigration Commission, which tells us that, notwithstanding the efforts of our McKinleys, Dingleys and Paynes, only two-fifths of our industrial workers at the present time are either American citizens or northern or western European aliens. Three-fifths are southern and eastern European aliens, most of whom are unable to speak the English language. These have practically displaced both native-born Americans and their nearer European kindred of Teutonic and Celtic blood.

So it seems that, after all, we have been protecting the alien pauper labor of Europe against the noble American wage-earning citizen! We cannot believe that Mr. Roosevelt (if elected) will "stand for" such a misadventure. He will probably put a protective tariff tax of say $500 to $1,000 per head upon all European labor hereafter brought thru Ellis Island.

The Triumphs of Chemistry

THE sciences when young behave like children. They delight in taking things apart to see what they are made of, and how they work. The ability to put things together and to make them work comes later. Chemistry is outgrowing its childish disposition. It is clearly passing from the analytic to the synthetic stage. It is becoming master of its material. It no longer waits humbly upon Nature for such gifts as that generous but absent-minded benefactor may happen to bestow. It now is in a position to command, direct and even to emulate the creative powers of Nature.

An impressive demonstration of this was given last week, when the Eighth International Congress of Applied Chemistry was assembled in the Great Hall of the College of the City of New York. From the lofty Gothic arches hung the banners of the great universities of the medieval and modern world. Beneath them were assembled representative men of science from the universities and the manufactories that now rival the universities in the fostering of research, 2,173 chemists from thirty different countries if they all got in. The speaker was Carl Duisberg, of Elberfeld, and before him were displayed specimens of chemical products costing thousands of dollars, but which a few years ago could not have been obtained at any price.

As these were introduced in turn to the audience the greatest applause was given to the newest of the marvels, artificial rubber. There was a whole washbowl full of the creamy curd, as fine as ever came from Kongo or from Amazon, and, what was more to the point, an automobile tire which had done its 4,000 miles and yet is serviceable. Only one other automobile so far has its like, that is the one which is recognized on the streets of Berlin when its horn sings out the copyrighted tune "Der Kaiser kommt!"

Not merely rubber but rubbers have been discovered, several new kinds with new properties, useful in their several places. Just as common rubber becomes hard and inelastic at the temperature of liquid air, so some of the new kinds are hard and inelastic at ordinary temperature. Dr. Duisberg exhibited a rubber ball which dropped to the floor like a stone, but after being heated by a burner it bounded over the heads of the audience. But Dr. Duisberg did not claim that synthetic rubber was yet a commercial success, nor did Professor Perkin, of Manchester, who was also present at the Congress, prove that he had come much nearer attaining this goal than his German rivals.

Synthetic chemistry, however, has no need to boast prematurely of its solution of the rubber problem, for it has enough else to talk about where its complete success cannot be questioned; silk, for example, now spun out of trees at the rate of 15,000,000 pounds a year and dyed with more colors than there are in the rainbow by the use of the anilins. If any one objects to applying the old name "silk" to its new rival in the textile field he may use the more accurate appellation, and in writing sonnets to his lady love allude gracefully to her becoming dress of cellulose-xantogenate. Synthetic rubies also she must wear to be in style, or some of the new and unnamed gems which can be prepared to order in any desired color, shape or size, now that we are no longer dependent for our precious stones upon the accidents of Nature's laboratory. The modernist or the futurist poet, too, will be hard prest to designate fittingly the perfumes which will announce the presence of his sweetheart and set his senses swimming. The chemist of today does not merely imitate the odors of the rose, violet and lily of the valley, but actually manufactures the same product as the flowers, and, besides that, he can produce other perfumes, which the nose of man has never before inhaled, but which he can at once perceive and enjoy, for he has in some mysterious way been endowed in advance with the possibility of appreciating this unprecedented sensation. These perfumes, new and old, are now made by the kilogram, and incidentally the Germans get $10,000,000 or $12,000,000 a year for the knowing how to do it.

Among the new materials added to industry are the substitutes for celluloid, not so easy to burn, and let us hope not so bad to smell; "cellon," which is made in blocks of 200 pounds, and can be cut and polished, drawn and molded; and "cellit," which can be used for moving picture films and so enable us to intro-

duce the kinematograph into our homes as the successor of the photograph album and the stereoscope.

Then there are a host of new alloys of iron with the rarer metals, the "Auer-metal" of 35 per cent. of iron and 65 per cent. of cerium, which when lightly scratched gives off a shower of sparks sufficient to light the gas jet; chromium-molybdenum steel, which will resist even the boiling aqua regia that dissolves gold; vanadium steels, which cannot be melted by the oxy-hydrogen flame that makes platinum fall in drops.

But far more important than any of these is the discovery of the secret of the synthesis of ammonia and nitric acid direct from the elements by means of the electric spark or of catalytic agents. For wealth, civilization, even life itself, is dependent upon the supply of nitrogen compounds, hitherto either those stored in the earth, in the course of geological ages or those slowly accumulated by certain plants with aid of microorganisms. But if we can get our nitrogen from the air direct then there seems no limit set to human progress.

This is the dawn of the day of man's independence. No longer need he rob the flower of its perfume or the silkworm of its painfully spun cocoon. He is freeing himself from Nature's bonds and will be able to develop such arts and sciences as his tastes may dictate, adding new pleasures to life and bringing within reach of the humblest treasures such as once were borne to distant lands to be laid at the feet of kings, attar of roses and robes of shimmering silk, strange dyestuffs and all manner of precious stones.

The Unified Town

For nearly a century past we have undertaken to secure progress, by dividing our towns into churches and political parties and social cliques, and of late into all sorts of clubs, and in other ways substituting something for the original Saxon township. The idea of our fathers was right, that the people and the whole people, thruout a convenient section, called sometimes neighborhood and sometimes town, should gather together for common consultation concerning matters of common welfare. These towns acting together became the commonwealth. For commonwealth we substituted the State, and the town lost its place as the substantial unit of political action and religious life.

The reaction which is now going on to restore the town and to strengthen neighborhood action is healthy altogether. We can never secure the completest development of individual forces, as well as neighborhood forces, so long as the individual is left to operate by himself. Above all, the division of society into clubs for men and clubs for women and scouting organizations for boys will not take us on the high road of progress. We must learn to act together in the town as we act together in the family. The Social Center Conference held at Madison, Wis., illustrated the fact that this has already become a matter of nation-wide importance.

The first steps included one of dissolution. Country churches faded out with the growing power of city life, but the reaction has come in thru the trolley and free mail delivery and rural telephones; and the first demand has been met by the creation of town schools. Large buildings, conveniently placed for the whole township, have rapidly taken the place of little wayside buildings thruout the whole land. The first intent of these buildings was purely educational; but what was more natural than that the people should see their importance as social centers. The school building became the only building and the fittest to welcome the people as a whole.

The phrase "community life" best expresses the new idea. In olden times we had no idea of a conscious direction of action for the town. What we mean now to accomplish is such a co-operation as shall accomplish progress of all the people, and shall not leave out a portion. In the Eastern States, the social center of development is manifested mostly in the larger towns and cities. In the Middle West in the smaller towns, and in the Southwest it is in the rural districts that conscious community building is developing most rapidly. The whole South is steadily waking up to the same sentiment, and the nation will find that very shortly the school house stands everywhere for a live town, with pur-

poseful progress, achieved by united action.

So masterful has this social idea become that very few school houses are now being built, without considering their adaptation to public ends. Where there are several rooms, adapted to school ends, these same rooms are turned over with new names for the parents and children together. Beside the library and reading room, a room is needed for debating clubs and another for social games, while the auditorium will meet the need of lectures, sermons and exhibitions. Seats are so placed that they can be easily removed, turning a school room into a combination study hall or gymnasium. The University of Texas furnishes architectural plans free to all the school districts of that State. Recreational activities in this way call in the adults and the young together, and in all cases under control of the board of education or the school trustees. Any town school building, if rightly constructed, can be easily adjusted to co-operative work.

We find in the report of the "Southwestern Social Center" a list of questions that have been debated recently, among them The Parcels Post, National Control of Express Companies, Co-education, Woman Suffrage, Workman's Compensation Act, The Present High Cost of Living, Woman's Status in the Home, Initiative and Referendum, The Recall of Political and Judicial Officers, A Graduated Income Tax, Direct Primaries and Their Influence on Political Honesty. It is easily seen that such questions, discussed by the people of any town, will enlighten them, remove prejudices, and broaden their methods of seeing and hearing. Another set of questions includes these: How Can I Best Help the School? How Can a Farm Home Best Secure Pure Water and Waterworks? Corn Seed Selection and Testing; Why the Cotton Seed of Our Community Is Inferior, and How Shall We Plant Wheat; Is Diversified Farming More Profitable than Specialized Farming? The minister and the physician and the collegian and the banker, all have their own standpoint, and can throw light on nearly every question suggested. Naturally in rural sections the problems discussed are nearly all those that concern country life and its betterment. One social center reports that in one of its meetings a farmer said that he had been able to increase his crop productions 10 per cent. from what he had learned in a single evening.

Evidence turns up everywhere to show that the social center idea is not only accomplishing what is proposed, but a great deal more. It goes back into the families to enliven as well as enlighten. Where men and women have too much to do to carry out or undertake methods of social improvement, the work is done by these gatherings. It simplifies social life, and instead of adding to the burden of duties it divides them justly between all. It has been found also to greatly affect the influence of social clubs. Where a community has been divided into little cliques, mothers' clubs, and sewing circles, and cooking classes, and corn clubs, and poultry clubs, as well as baseball associations, and debating societies, and good roads and rural improvement societies, all these and other organizations come together, losing nothing of their purport, but making the home town really a home. It has been found also, above everything else perhaps, to react upon the school itself. The people feel a personal interest in the building that they use and in all that is done in it. The school topics are discussed in the centers, and very naturally the superintendent, if he be a wisely selected man, becomes the center of town life and the leader in all progressive movements.

The social center attracts young people from the street; it refines sports and establishes reading rooms and libraries. It is now pretty generally understood that industrial education will hereafter command our school system. The demand for it is universal. There will be tools as well as books, tools for the shop and tools for the field. Bringing this about has put a new idea and purpose into the library itself. Boys and girls who cared for books merely as books will learn very speedily how books and tools go together. This will be the sort of library that will be built up. It will go with the laboratory and the shop. Where the social center is operating

most perfectly the up-to-date library is surest to be found. The social resources of any community are vastly greater than commonly appear. The social center calls these out and puts them to work.

Limiting Postal Savings

The present law is so careful of the banks that it refuses to allow any one to deposit more than a hundred dollars in a month, or more than five hundred dollars in all. That is a very unwise limitation. Banks do not need to be so protected, for the far larger part of the money deposited in the post office would never have been put in the banks; and when once in the post office it is redeposited in a local bank. It is so much in addition that the bank gets, which may help it in a tight place. There ought to be no limit put on the amount of deposit that would be accepted, but it might be well, as Theodore L. Weed, director of our postal savings system, told the bankers the other day, if interest be limited to a deposit of $1,000. It is but a year and eight months since the first postal banks were opened, and the deposit at present is over $23,000,000, for 270,000 depositors in about 13,000 towns and cities. The number of post offices receiving deposits is being increased at the rate of about 1,000 a month. Considering our wealth and wages paid it would seem as if the limit set to deposits received ought to be higher than in European countries; instead of that it is lower. Congress should remove the limit.

A Plank Rejected

A somewhat careful reading of the leading journals representing the colored people shows a strong preponderance of feeling against Mr. Roosevelt and his party. The leaders cannot and will not forgive his treatment of the negro delegates who were refused admission to his convention from the Southern States. Every one knows that there are two opposed wings among the negroes, radical and conservative, but both are agreed on this subject, and it will tell strongly against the Progressives and in favor of the Republicans in the November election in those States in which there is a large negro population that is accustomed to cast its vote. Professor DuBois in his *Crisis* declares that "at last there can be no doubt in any colored man's mind concerning the attitude of Theodore Roosevelt toward his race." Professor DuBois then gives the text of the plank which at Chicago the Progressives were asked to put in their platform, but refused, preferring to seek favor in the South. This was its text:

"The Progressive party recognizes that distinctions of race or class in political life have no place in a democracy. Especially does the party realize that a group of 10,000,000 people who have in a generation changed from a slave to a free labor system, re-established family life, accumulated $1,000,000,000 of real property, including 20,000,000 acres of land, and reduced their illiteracy from 80 to 30 per cent., deserve and must have justice, opportunity and a voice in their own government. The party, therefore, demands for the American of negro descent the repeal of unfair discriminatory laws and the right to vote on the same terms on which other citizens vote."

Cowardly silence was preferred to brave justice. But it does not pay. *The Crisis* asks:

"Now, Mr. Black Voter—you with 600,000 ballots in your hand, you with the electoral vote of Illinois, Indiana, Ohio and New York in your pocket—*what are you going to do about it?*"

General King's Withdrawal

Gen. Horatio C. King is the Progressive candidate for Comptroller in this State. It was brought against him by Senator O'Gorman that he was not, like Oscar S. Straus, candidate for Governor, a friend of the immigrant, but an advocate of restriction, as shown by the fact that he was a member of the Guardians of Liberty. Thereupon General King declares that he was deceived as to the purpose of that organization and resigned as soon as he learned its unpatriotic purpose. He had asked, before consenting to join, if it was hostile to Catholics and immigrants and had been told that it was not, but that it was a purely patriotic society. He was deceived, and so were the other members from the army and navy. The head of the society is Charles D. Haines, and, with all his explanation, it is clear that his language means special hostility to the Catholic Church and a revival of the Knownothing and A. P. A. purposes. It is against

the Catholic Church that the Guardians of Liberty claim to be defending the liberties of the country.

Federation for Great Britain

Whatever may be said against the Liberal Government of Great Britain it is certainly courageous and constructive. It has more than once been suggested that the granting of a local parliament to Ireland would logically be followed, or accompanied, by local parliaments, like our State legislatures. for England, Scotland and Wales; and the Unionists of the north of Ireland have been demanding a separate parliament for their section. Now, in an address in Scotland, Mr. Churchill, First Lord of the Admiralty, outlined a scheme for local parliaments more numerous than has been previously devised. England alone, he said, is too large for a single parliament of its own, and should be broken up into provinces, what we call States, such as Lancashire, Yorkshire, the Midlands and London. He told his hearers that if the whole of Great Britain and Ireland were divided into ten or a dozen provinces, each with its parliament attending to local affairs, this would be no more than we do successfully in this country, and with no conflict with the central national Government. He made the very important statement that home rule for Ireland was, in the purpose of the British Government, the forerunner of a genuine system of self-government for the four countries of the kingdom. They call it devolution, and it is making rapid progress in all parts of the country, and will before long be accomplished if the present Government does not lose its majority, which can happen only by a division between the Liberals and the Laborites, such as gave the Conservatives the plurality in the late election in Midlothian.

Pulpit Rhetoric and Theology

The theology of the days of the New England Primer, which taught our grandparents that "In Adam's fall We sinned all," travestied even in those days in the couplet, "In Cain's murder We sinned furder," finds a refuge on the further Western coast. The Rev. M. A. Matthews, of Seattle, Wash., who is, for the year, Moderator of the Presbyterian General Assembly, and whatever dignities and authority thereunto appertain, is thus quoted from a sermon preached at Winona Lake to an audience of 3,000 hearers. He was attacking a certain important and highly esteemed religious journal:

"Perhaps some of you young ministers study *The* ——— and think yourselves very wise. If ever there was a publication edited by a heretic, *The* ——— is that sheet. It is edited by a bunch of heretics. If you continue to read it you will have theological meningitis, sociological neuritis and political gastritis."

The Moderator is a master of rhetoric. Thus he continues:

"The publication is under the ban of the pure food law, because it never had a baked article in it nor an unadulterated one. A little peanut stands up and talks about the Book of Jonah being an allegory. Open his sawdust head and put in it some brains. If you accept such teaching you are dying of top rot or of internal decay."

Such rant is a disgrace to the pulpit. The Book of Jonah is past all doubt a story, a beautiful and valuable story, not a history. If there were any Presbyterian professors of theology in the Winona audience they must have laughed with averted faces. Yet there are even in the East those who have learned nothing these last one hundred years and who believe the world to be but six thousand years old. We find the following in a Philadelphia religious paper, not Presbyterian, in comment on a fossil supposed to be seventy thousand years old:

"The tendency to claim vast stretches of time for all organic life on the earth is not so harmless as it may seem to many readers It denotes a tendency to Ingersollism."

According to the Rome correspondent of the New York *Sun*, the rumor that the United States is to have another cardinal has no assured foundation; but, if another cardinal should be created, the honor would go either to Archbishop Ireland of St. Paul, or Archbishop Quigley, of Chicago, with the chance favoring the latter. To our idea that would not be a creditable choice, recalling the criticisms on his being chosen as Archbishop. The following paragraph in the despatch is suggestive:

"The Pope hesitates to increase the number of American cardinals for the present, lest it

be said that he is favoring America on account of the contributions of the candidates. It is known that Cardinal O'Connell gave the Pope $100,000 and that Cardinal Farley gave him $40,000, the total sum exceeding the contributions of all the other Cardinals combined."

Mr. Valentine, Commissioner of Indian Affairs, is very careful to have it understood that he resigns his office, not because he has been defeated in his effort to put a stop to the wearing of a religious garb by teachers of Government Indian schools, but because he wants to help, for six weeks, the success of the Progressive party. Nevertheless the public will connect his resignation with the suspension by the President of Mr. Valentine's order. Doubtless Mr. Valentine was right in principle, but it was not wise to issue his prohibition without authority from his superiors. He deserves great credit for an enthusiastic devotion to the best interests of the Indian service, courage and integrity. He has given himself to the work unreservedly and done his best with a single eye to the welfare of the Indians. His specialty, among Commissioners, has been the reorganization of the service, both in Washington and in the field, with a view to getting it on a better business footing and getting rid of antiquated methods and substituting modern ideas and devices. Classification, organization and efficiency have been his aim thruout his whole administration. He nearly wrecked his health in the process, but will be able to bring the energy and enthusiasm of a young man to any other task he may undertake.

With the publication this week of the important article by ex-President Sun Yet-sen, we have the cabled dispatch that he has presented to President Yuan Shih-kai a great project for Chinese railways, with the purpose of opening the empire to domestic and foreign enterprise, and that funds have been given to Dr. Sun to develop his plan. This implies that the two are working together, and that the reports of division and rebellion are much exaggerated.

New Orleans, with its population of 340,000, is the first large city to adopt the commission form of government. Six others have 100,000 population, or more: Oakland, Cal.; Birmingham, Ala.; Memphis, Tenn.; Omaha, Neb.; Lowell, Mass., and Spokane, Wash. Since Galveston, Tex., put its government into commission eleven years ago, after its great disaster, over two hundred cities have followed its example, getting short ballots and responsible efficiency. The movement has not begun to wane.

Syndicalism and the general strike of labor against the country has not yet gained the judgment of the British combined laborers. At the very recent meeting of the House of Commons of Labor, the question came up directly for a vote, which stands 1,123,000 against and 550,000 for syndicalism. A general strike in support of some single industry is impossible so long as there is not yet an amalgamation of industries.

The suggestion that the inscription "They forsook their nets and followed Him" be inscribed on a window in the Winchester Cathedral, in memory of Izaak Walton, author of the "Complete Angler," is not a happy one. A better biblical text would be: "He taketh up all of them with the angle, he catcheth them in his net, and gathereth them in his drag. Therefore he rejoiceth and is glad."

The report from Palestine that the Zionist Jews there, who number now over 20,000, are to be allowed by the Turkish Government to govern themselves locally, is not unlikely to be true. They are progressing rapidly in agriculture and business as well as in numbers, and are seeking for industrial prosperity, and not for political independence.

The negro, Walter Johnson, lynched at Princeton, W. Va., charged with assault, has been proved innocent of the charge, and the Governor is determined to have the lynchers punished. We hope he will succeed better than did the Governor of Pennsylvania in a late case.

A taste for paradoxes has ruined many a man morally.

Insurance

Workmen's Compensation Insurance

To the writer of this page, for thirty years a worker in and a student of insurance in its various forms, a witness to many changes and developments in its constitution and practices, no event, directly or indirectly, connected with its history during that period appears so marvelous as the genesis and maturity of the principle involved in the system of compensation for injuries sustained by industrial workers, and the rapidity with which that system has become an established part of our social fabric. As yet the evolution is by no means complete; in fact it remains decidedly incomplete in spite of the progress already attained.

Altho insurance companies will readily adapt their present machinery to permit of the assumption in a strictly scientific manner of the hazards involved, workmen's compensation insurance is not a development of previous forms of corporate insurance activity. That is to say, it was not first conceived by the insurance companies and offered to employers and employees in anticipation of the demand. It comes forward in satisfaction of a demand for relief from certain responsibilities created by fundamental changes in the laws regulating the relations between workmen and their employers. The nearest approach the insurance companies had previously made to this form of indemnity consisted of coverage in the form of liability insurance as a protection to employers against injuries sustained by their workmen and the public, and a plan known as workmen's collective insurance, providing benefits directly to workers at their expense.

During the past three or four years there has developed in this country a strong demand for the protection of industrial workers against risks of death and injury incident to the occupations in which they are engaged. In a score of the leading manufacturing States radical changes have been made in the laws, and in most cases the old common law defenses have been taken away from employers. The pith of the principle as demonstrated by the movement seems to be that, regardless of the manner in which a workman is killed or injured while following his occupation—even tho he is himself responsible for the misfortune—he is entitled to compensatory damages. Stripped to its bones, this means that the expense incident to injuries sustained by workmen is a legitimate part of the expense of the business in which it occurs, and must be so regarded by employers.

There is no hazard incident to the regular and orderly association of men with each other the effects of which cannot be equitably distributed over the whole mass by the scientific methods of insurance, and, as previously intimated, the companies engaged in the casualty business will successfully meet and solve the new problem presented to them But it is necessary to understand that it bristles with difficulties. Except the statistics compiled from the records of employers' liability and workmen's collective business, there is no experience to which the companies may resort in formulating policy contracts and rates to be charged, and it would seem necessary for them to advance with caution, because, as a matter of fact, the liability and workmen's collective experience is of little practicable value in this connection.

The doctrine of workmen's compensation as it is being preached and developed in this country indicates a radical alteration in our social constitution, and has a tendency to bring it into closer resemblance to conditions which exist in older and less admired communities in Europe. Its tendency is to divide—clearly to define classes—to lower the social condition of the workingman by posing him as an object of sympathy or a victim of industrial oppression—a policy, which in time may render him, as it has the workmen of Germany and England, obsequious and servile, a malingerer and a pursuer of benefits. These possibilities are mentioned here because, if they develop, they must necessarily find a place in the calculations of underwriters.

Financial

The Great Crops

It is difficult to overestimate the importance of the Government's crop report that was issued on the afternoon of the 9th. The harvesting of very large crops is assured. The weight of the cereals (133,016,000 tons) will, it is estimated, exceed the weight last year by 20.3 per cent. Last year's yield of six cereals was less by nearly 1,000,000,000 bushels than the quantity shown this year. If the previous highest yields be added together, the sum of them is less than this year's total by 140,000,000 bushels. This September report made the following additions to the estimates of the report in August: Corn, 139,000,000; oats, 82,000,000; wheat, 10,000,000. In all probability the final harvest figures will show further increases, for it is the opinion of good authorities that even in the very large quantities which the report sets forth there has been an underestimate. Below are shown the quantities indicated for this year's harvest and the actual yields in 1911:

	Indicated, 1912.	Harvest, 1911.
Corn	2,995,000,000	2,531,488,000
Oats	1,290,000,000	922,298,000
Spring wheat	300,000,000	190,682,000
Winter wheat	390,000,000	430,656,000
Total wheat	690,000,000	621,388,000
Rye	35,000,000	35,119,000
Barley	209,000,000	160,240,000
Buckwheat	18,000,000	17,549,000
Flaxseed	29,000,000	19,370,000
Rice	23,000,000	22,934,000
Potatoes	398,000,000	292,737,000
Tobacco, lbs.	976,000,000	905,109,000
Hay, tons	72,000,000	55,000,000

The indicated crop of corn exceeds the record crop (1906) by 68,000,000 bushels; there will be 367,000,000 bushels more of oats than were harvested last year, and the record crop (1910) will be surpassed by 104,000,000; there is a notable increase of the yields of potatoes and hay; nearly 50 per cent. has been added to last year's flaxseed crop, and the record for tobacco has almost been reached. It is well known, also, that reports for small fruits and vegetables are, as a rule, not less favorable. The abundant supply of feed for cattle and hogs should affect the price of meat. Our surplus, however, will be in demand abroad, owing to crop shortage in Western Europe.

The stimulating effect of this abundance was not seen last week in the securities market, where prices declined a little, owing mainly to higher rates for loans. But eventually it will be perceived there. The crops are about to tax severely the carrying power of the railroads, and it is estimated that 500,000 more cars than can be had will be needed.

....The output of gold at the Rand mines in August was £3,248,395, against £3,030,360 in August of last year.

....During the year 1911, the Canadian Pacific Railway established forty-one new towns in the three provinces of Manitoba, Saskatchewan and Alberta.

....The Steel Corporation's unfilled orders on hand August 31, as reported last week, were 6,163,375 tons. This is the largest quantity shown since September, 1907.

....This country now produces 38 per cent. of the world's annual output of coal, and its quantity has increased by 250 per cent. in the last twelve years. Great Britain is second and Germany third.

....It is expected that the inheritance taxes on the estates of E. H. Harriman, John Jacob Astor, Isidor Straus, Benjamin Guggenheim and Edwin Hawley, in New York, will amount to about $6,000,000.

....New capital issues—bonds, short-term notes and stocks—of railroad, traction, industrial and mining companies of the United States, in 1911, as shown by the *Journal of Commerce*, amounted to $1,739,487,720, which is a new high record. The amount in 1910 was $1,518,272,579, and the record had been held by 1909, when the total was $1,681,620,680.

The Independent

VOL. LXXIII NEW YORK, THURSDAY, SEPTEMBER 26, 1912 No. 3330

Survey of the World

Who Will Win? A Washington newspaper quotes Mr. Roosevelt as saying, before he started West:

"I will eat the vitals out of the old Republican party and frame up the organization for myself in 1916."

A New York paper prints a dispatch from London purporting to quote a letter from the candidate to a friend in England, to the same effect. Mr. Roosevelt makes light of the incident. Apparently Mr. Taft, for his part, seriously expects to carry the country. He is said to be confident of receiving 290 electoral votes—266 being necessary to elect. Senator Sanders, of Tennessee (Rep.), concedes California alone to Mr. Roosevelt, and thinks Mr. Taft has a fighting chance in Missouri, Kentucky, and his own State. Wilson campaigners look for 9,000,000 votes for their candidate, allowing Taft 5,000,000 and Roosevelt 2,000,000. In 1908, the total vote was only 14,888,442. Representative Palmer, of Pennsylvania, chairman of the Democratic committee in that State, asserts that Wilson will carry even that rock-bound Republican State "by a large majority." The Democrats are sending Governor Marshall, Louis D. Brandeis, Senators Williams, Smith (Georgia), Gore and O'Gorman, ex-Governor Folk, Representatives Redfield, Henry and Underwood, and other speakers, into the State.——Eugene V. Debs, Socialist nominee for President, says that Taft is out of the race, and believes that Roosevelt's strength will shake even the "solid South." Senator Dixon says that Taft and Debs will run "neck and neck" for fourth place, and that he finds "no Wilson sentiment west of the Mississippi."

Campaign Contributions and the Trusts Mr. Roosevelt denies the charge made by Judge Thompson that in 1904 his campaign fund was $16,000,000 (Judge Thompson is Democratic candidate for Senator from Kansas.)——Senator Dixon says that "not more than $150,000" was spent on the Roosevelt primary campaign this year. He will be one of the witnesses called to testify before the Clapp Committee of the United States Senate concerning recent campaign contributions. Other witnesses will be J. P. Morgan, George W. Perkins, George B. Cortelyou, Cornelius N. Bliss, Jr., and Theodore Roosevelt.——In the *Commoner* Mr. Bryan denounces Mr. Roosevelt's proposition, "that campaign contributions are purged of taint when received without any kind of promise or obligation." He thinks that as a would-be regulator of the Trusts Mr. Roosevelt is in the position of a judge soliciting and receiving gifts from litigants. ——Owing to the illness of counsel for the defendants, the taking of testimony in the Government's suit against the International Harvester Company, under the Sherman anti-trust law, was postponed on September 19. Government Attorney Grosvenor has produced a voting-trust agreement, valid for ten years, and dated August 12, 1902, indicating that stock given to George W. Perkins, Cyrus H. McCormick, and Charles Deering gave them control of the alleged harvester trust. Mr. Perkins, served, also, as chairman of the committee on finance. Four of the six members of this committee, including Mr. Perkins, were directors in the Steel Corporation and members of that Corporation's finance committee. On Sep-

tember 16, Governor Marshall referred to Mr. Perkins as "presiding over" the harvester trust. Next day Mr. Perkins denounced this remark as an untruth. Governor Marshall repeated some of the statements recently made in regard to the harvester trust's alleged backwardness in its treatment of its employees. This especially piqued Mr. Perkins, who denied that he had anything to do "with the direction of affairs at the factories," asserting also that the company was well disposed toward labor. It is stated that while the company sold $100,000,000 worth of farm machinery last year it cleared only $150,000.——The Government investigation of the Steel Corporation will be resumed in Pittsburgh, October 1.

Mr. Roosevelt on the Stump

At Tucson, Ariz., on September 17, Mr. Roosevelt announced that if reelected President he would make Washington a model city for other municipalities to copy. In Alaska his government would be able to build railways and put State socialism to the test. As President he would call an extra session of Congress "to be devoted exclusively to putting into Federal law every provision recommended in the [Progressive party] plank dealing with social and industrial justice." The Government should be a "model employer," adopting the principles of workmen's compensation, the minimum wage, the proper safeguarding of machinery, etc., in all departments. At Denver, on the 19th, Mr. Roosevelt declared for the "recall of Presidents" for misconduct or inefficiency. His declaration was received with loud applause. "Third term talk which refers to nonconsecutive terms is an utter absurdity," said Mr. Roosevelt. In Nebraska he repeated charges that the Republican nomination was stolen, and to Mr. Bryan's countercharge that his own platform was stolen he replied that he would not accept the Democratic platform as a gift. Governor Wilson has accused Mr. Roosevelt of "practically abandoning any serious attempt to meet the main issues," and Mr. Roosevelt angrily retorts that Wilson himself is shifty. As yet the Progressive candidate has not called the Governor a liar, stopping short with charges of "deliberate misrepresentation," disingenuity, obscurity, confusion, "inaccurate statements of fact" in regard to the Progressive policy toward trusts, and inability "to state facts as they are in speaking of what he does not like." He calls Governor Wilson the James Buchanan of 1912.——Senator Dixon, of Montana, chairman of Mr. Roosevelt's campaign committee, charges that two agents of the United States Department of Justice ("Wickersham spotters," is his phrase) have been spying upon him and Medill McCormick, tapping wires and stealing his papers. The charge is denied.

Governor Wilson Out West

Governor Wilson returned to New Jersey from the West on the 21st. He traveled 3,000 miles and made twenty-five speeches, all but one of them extempore, in six States. The trip proved highly encouraging. At Sioux City, Ia., Governor Wilson spoke in praise of Dr. Wiley and denounced Mr. Roosevelt for hampering him in the benzoate of soda crusade. Next day, at Minneapolis, he paid a tribute to "the patriotism, integrity, and honesty of purpose" of Mr. Taft. If the President had fallen into bad company, the company had been made for him already, when he came into office. If he had taken bad advice, it was because he was surrounded by evil counsellors. Most of Governor Wilson's speeches have dealt with the tariff question. Referring again to Mr. Roosevelt's description of tariff benefits as "prize money," he said that this did not, perhaps, imply piracy, but did imply capture, rather than any process of earning. He attacked the legalization of monopoly thru governmental regulation—excepting the natural monopolies, of which railroads are the stock example. His opposition to trusts he based, not upon jealousy of their size, but upon his disbelief in their economic efficiency and public value.

"The United States Steel Corporation had to buy Mr. Carnegie out, because Mr. Carnegie organized his business, economized his processes, ordered his plants in such a fashion that he could beat every mother's son of them in manufacturing steel rails. He had the market, because he could legitimately undersell them, and they had to pay him I don't

know how many times, three or four times, the value of his property and of his business in order to get rid of him, in order not to be beaten by him in open competition.

'Now, do you want that sort of thing to go on? Do you want the efficiency of your business lowered by creating the necessity and temptation to put those men out who are the most efficient? Has not America profited by the growth of just such enterprises?"

"The only leg the third party has to stand on is the assertion that the trusts are organized for efficiency," said Governor Wilson. But if one examines the statistics of the Steel Corporation's business, one finds that, wherever it has competitors,

"the amount of the product which it controls is decreasing, not increasing. In other words, the corporation is less efficient than its competitors, and its control of the product is increasing only in those branches of the business where by purchase and otherwise it has a practical monopoly."

In Ohio, Governor Wilson was greeted by Governor Harmon, and the State campaign was opened at Columbus. Governor Johnson opened the Ohio campaign for the Progressives, and Senator Lodge for the Republicans.

Wilson and the Bosses

In one of his Minneapolis speeches last week, Governor Wilson had something to say of bosses. As at Detroit he referred to their innate stupidity and to their want of power if boldly attacked. "You have only to state in public what they are and you put them out of business. A boss isn't a public leader, because parties don't meet in back rooms." Their guns are loaded with buncombe, he continued. Governor Wilson hastened East to Jersey City to denounce James Smith, Jr., the ex-Senator, who is anxious to return to Washington in his old capacity. New Jersey politicians sent him a telegram, which he received at Columbus, protesting against intrusion in a State primary campaign, but the Governor disregarded their advice. The fact that Smith (who is a high tariff advocate) describes himself as a "Progressive" gave Governor Wilson the cue to offer him, bag and baggage, to the Progressive party. The candidate preferred by Governor Wilson is ex-Representative William Hughes, of Paterson, other Wilson candidates having withdrawn in order to strengthen the opposition to the boss and his bipartisan ring.——The only other factional fight which confronts the Democrats is that in New York. Mr. Murphy, of Tammany Hall, was with James Smith, Jr., in opposing Wilson at Baltimore; tho he reluctantly accepted him at last, he expected to retain control of the New York ticket. But local opposition has developed to the renomination of Mr. Murphy's own Governor, Mr. Dix, and the independent Wilson Democrats who call themselves the Empire State Democracy have drawn up a list of candidates for State officers, headed by Frederic W. Hinrichs, for Governor. This ticket will be withdrawn if Senator O'Gorman and William G. McAdoo, the New York Wilson leaders, succeed in persuading the convention to make good nominations. Murphy and the National Democratic Committee (of which O'Gorman is a member and McAdoo acting chairman) are on bad terms. Murphy finds the Senator "ungrateful," and has not had him named as a delegate to the State Convention. But Senator O'Gorman will be on the ground—probably armed with a proxy.

Labor

At the State convention of the American Federation of Labor, held at Fitchburg, Mass., September 19, an outsider was invited to speak upon politics for the first time in the history of the organization. Louis D. Brandeis, of Boston, hailed by the convention as "the people's attorney," was the speaker, and advocated the election of the Democratic nominees. "A significant omission in the Progressive platform was the absence of an acknowledgment of labor's right to organize," he declared. (Mr. Roosevelt has since pointed out that his platform "favors the organization of workers as a means of protecting their interests and promoting their progress.") Mr. Brandeis referred to George W. Perkins, chairman of the Progressives, as "the father of Trusts," and to Trusts as the consistent enemies of unionism. "The new party stands for the perpetuation and extension of private monopoly," said Mr. Brandeis. "Espionage and discharge as a trust method of subjugating labor is supplemented by the subtler and gentler

device of 'welfare work.' The Steel Corporation has done much work of this character. . . . They create a new form of peonage."——6,200 men, many of them Greeks and Cretans, are idle because of the strike in the copper, lead and silver mines at Bingham, Utah. A majority is made up of actual strikers. They demand an increase in wages. The strikers have entrenched themselves and exchanged fire with deputy sheriffs. Strikes are in progress also in Kanawha County, W. Va., and at Lafayette, Col., coal mining communities. Five hundred men are on strike at Hartford, Conn., in the shops of the Colt Manufacturing Company, makers of firearms. Trackmen on the Pittsburgh and Lake Erie Railroad have struck for higher wages at Fayette City, Pa., and elsewhere.—— William D. Haywood, of Denver, general organizer of the Industrial Workers of the World, was arrested at Boston on September 15, charged with conspiracy. The arrest followed his delivery of a speech urging a general country-wide strike as a protest against the incarceration of Ettor and Giovannitti on indictments charging them with being accessories to the murder of Anna Lopezzi at Lawrence, Mass., during one of last winter's strike riots. Haywood pleaded not guilty next day, and was released in $1,000 bail. Joseph J. Ettor and Arturo Giovannitti, I. W. W. workers, have been in jail since January 30. Their sympathizers have often exclaimed at the Government's slowness to put them on trial, denouncing an alleged capitalistic conspiracy. The Boston *Transcript* asserts that they "could have been tried last spring had they so desired. . . . Every continuance of the case has been at the request of the defendants." The trial is now set for September 30.—— The completion of a national organization to be known as the Structural Alliance, made up of the Bridge and Structural Iron Workers' Union, the Bricklayers' Union and the Hoisting Engineers' Union, was announced at Cleveland, Ohio, September 20. By the constitution, none of the trades can strike without the consent of the others.—— J. Keir Hardie, one of the founders of the British Labor party, told members of the City Club of Chicago, on September 17, that 33 per cent. of English workingmen face starvation.

Mexico

Minor reverses in the north seem to have weakened the prestige of the insurgents thruout Mexico. Yet on the 19th, Emilio Campa made a raid on Caborcia, Sonora, and looted the town, killing many of its inhabitants. From Caborcia he set out for Noria, only sixty miles south from Douglas, Ariz. An insurgent victory was reported on the same day from Musquiz, Coahuila. Pasquale Orozco has escaped into this province. Eighty Federals were defeated, with heavy losses, by a superior force of rebels. On the 19th Colonel Obregon, Federal, defeated a band of insurgents twenty-seven miles south of Agua Prieta. He surprised the insurgents at supper at the San Joaquin ranch. American ranches have suffered greatly during the last few months.——The cruiser "Des Moines," U. S. N., anchored off Tampico on the 18th. This is the first American warship to appear on the eastern coast of Mexico for more than a year.—— Orozco, Senior, and his five companions, captured by United States troops at Presidio, Tex., were found not guilty of neutrality law violations on September 20, and were released by Commissioner Griffin at Marfa, Tex. Orozco and Cordeva were immediately rearrested at the request of the Mexican Consul at El Paso, who will try to secure their extradition.——Juan P. Diddap, diplomatic representative of the rebels at New Orleans, declared on the 19th that Charles P. Taft and other financiers helped to finance the Madero revolution, advancing $5,000,000, and being repaid with a bonus of $20,000,000.——President Madero sent a message to the Mexican Congress on the 16th in which he says that $18,000,000 of the $20,000,000 loan made in June is already spent. American claims for indemnity growing out of the battle of Juarez in 1911 remain unsettled because of the exaggerated demands, he says. He declares that the revolution is practically ended. He promises army reform and recommends compulsory military service.

In Nicaragua The State Department at Washington issued on September 17 the text of a note presented to the Nicaraguan Government by United States Minister Weitzel at Nicaragua. The note has been placed also in the hands of the rebel leaders, and communicated to the Nicaraguan press. Our purposes are defined as being the defense of the American Legation, the safeguarding of travel in Nicaragua, and the protection of American life and property. The United States will not countenance a restoration of the "corrupt and barbarous" order which existed under the rule of the dictator Zelaya. General Mena is said in this note to be attempting to impose Zelayaism upon the Central American republic, and is denounced as a man unspeakably cruel, untruthful, and revolutionary. The acting Secretary of State, Huntington Wilson, signs this document. At Washington it is hoped that better relations with Central America will result.——An American column of marines commanded by Major Smedley D. Butler left Managua on the 15th and on the 20th reached Granada. Their intention was to reopen railway communication with the interior, which faces starvation. On the 18th their train was fired on and three Americans were slightly wounded. This was near Masaya. An apology was made by the insurgent leaders, who disavow the action. On the 19th rebels captured San Jorge, a port on Lake Nicaragua, and capital of a department, defeating the Nicaraguan Government forces. The warfare of the rebels is said to be marked with great atrocity. Women and children are reported to be the victims of medieval barbarity. The American force in Nicaragua consists of 800 bluejackets and marines, with two 3-inch guns.

The Ulster Revolt On September 18, the ten day campaign for the organization of opposition to home rule began with a mass meeting at Enniskillen. A platform had been erected on Portora Hill sufficient to hold 1,000 persons, and a crowd estimated at from 15,000 to 20,000 assembled around it. A special roadway was cut to the hill and the town gaily decorated. Sir Edward Carson, ex-Solicitor General and president of the Ulster Orange Association, is the leader of the campaign. Everywhere he is met with a military escort of Orangemen dressed in khaki and bearing dummy rifles. At Londonderry, which is even more fiercely Protestant than Belfast, similar scenes were enacted. Sir Edward Carson said that this was a siege like that of 1688, and by signing the new covenant they were again closing the gates of the city against the enemy. They were, he said, defying the Government, but the Government had not the courage even to prosecute a cattle driver in the south or west. The procession of torch bearers escorting Sir Edward Carson thru Londonderry was attacked by a home rule mob, and a riot ensued and Sir Edward had a narrow escape from injury. The Bishop of Londonderry preaching at the cathedral, asked his hearers if they supposed their duty to God and the unborn generations would be discharged by tamely submitting to be sold like brutes in the cattle market by men whose compensation was the seventy venal and dishonest votes of their sworn foemen, who had openly declared that they would take revenge in the day of their triumph. The Most Rev. John Baptist Crozier, Primate of Ireland, has designated the week as days for special prayer for deliverance from the imminent dangers threatening the welfare of the Church and country. The covenant which has been prepared by Sir Edward Carson for adoption on Ulster Day, September 28, reads as follows:

"Being convinced that home rule would be disastrous to the material wellbeing of Ulster as well as to the whole of Ireland, subversive of our civil and religious freedom, destructive to our citizenship, and perilous to the unity of the Empire, we, whose names are underwritten, men of Ulster, loyal subjects of his gracious majesty King George, humbly relying on God, in Whom our fathers in days of stress and trial confidently trusted, hereby pledge ourselves in solemn covenant thruout this, our time of threatened calamity, to stand by one another in defending, for ourselves and for our children, our cherished position of equal citizenship in the United Kingdom, in using all means which may be found necessary to defeat the present conspiracy to set up home rule in Ireland, and in the event of such Parliament being forced upon us we solemnly and mutually pledge ourselves to refuse to recognize its authority, in the sure confidence that God will defend the right."

The Moderator of the Presbyterian Assembly has advised pastors to sign the covenant and open their churches to Unionist demonstrations. This action, however, has aroused opposition. It is said that 200 of the 500 Presbyterian pastors in Ireland favor home rule.

Suffrage Demonstrations

Many countries are now disturbed by movements for the extension of the suffrage. In Hungary the demand is votes for men; in England it is votes for women; in Belgium and Holland for both. The Chamber of Deputies at Budapest has often been the scene of tumult, but never more violent than those that marked the opening of parliament on September 17. Count Tisza, who was elected Speaker on May 22, is strongly opposed to the extension of suffrage to all men, and on that account the Opposition is determined to force his resignation. At the last session of the Chamber in June, a member of the Opposition, Julius Kovacs, fired three shots at the Speaker, tho without hitting him. When the Chamber reassembled the Opposition deputies had armed themselves with weapons less dangerous than revolvers, but quite as obstructive of parliamentary procedure; that is, with whistles, bugles, motor horns and cowbells. As soon as Count Tisza entered they began an uproar that lasted all the afternoon. Finally Count Tisza decided to call upon the police to remove the disturbing element, but this was not easily done. A hundred of the deputies, under the leadership of Count Apponyi and Count Zichy, gathered in the middle of the chamber and barricaded themselves with dismantled desks. Two of the policemen refused to obey the order to enter the chamber, but the rest seized the riotous deputies and carried them out to the lobby, tho it sometimes required six policemen to one man. Count Karolyi, after having been carried to the door, broke away from his captors and rushed back to his seat, where he fell in a faint. Count Esterhazy had his finger severely bitten and another member had his arm nearly wrenched from its socket in the struggle. After all the Opposition except fifteen had been removed Count Apponyi told the commandant of police that they would quit if the police would leave first. This was agreed to, and after the broken seats had been replaced the Chamber resumed its session with only the supporters of the Government present. Count Tisza, in addressing the Chamber declared that business would neither be carried on nor be stopped by children's whistles. On the following day the disorder was renewed, but 200 policemen were on hand to drag out the disturbers. Herr Beothy, Minister of Commerce, was attacked in the chamber by Opposition members, who struck him in the face and knocked him down. In the evening the Socialists attempted a street demonstration in favor of the suffrage and came into conflict with the police. The mob threw down the gas lamps on Lisabethstrasse, throwing the quarter in darkness, then in compensation made a bonfire out of street cars. The mounted police, in charging the crowd to clear the street trampled upon 200 persons.——The Dutch parliament, which opened on the same day as the Hungarian, was met with a similar demand for an extension of the suffrage. The Socialists, who last year presented a petition with 320,000 signatures for universal suffrage, this year attempted a similar demonstration. The Mayor of The Hague refused to allow a procession on the opening of the States-General, but in spite of the prohibition more than 20,000 persons assembled with banners and badges calling for votes, an eight-hour law and votes for men and women alike. After listening to speeches from sixteen platforms the crowd divided into ten parties and marched singing toward the parliament house, but were checked at all points by the police, who used their naked swords to repulse them, inflicting some wounds.——The Belgian parliament meets in November and the leaders of the Socialists threaten a general strike of half a million men if universal suffrage is not granted.——In Wales the suffragets attempted to break up a meeting at which Chancellor of the Exchequer Lloyd-George was speaking, but were attacked by the crowd, knocked down and trampled under foot. Mrs. Mary Leigh, who was on August 7 sentenced to five years' imprisonment for

throwing a hatchet at Premier Asquith was released from the Dublin prison "on license" because she had refused to eat or drink and altho she had been forcibly fed for forty-four days, she was in danger of dying from starvation.

The Turco-Italian War The peace negotiations now being carried on in Switzerland, far from allaying hostilities, seem to have stimulated both parties in Tripolitania to renewed activity. The most bloody battle of the war was fought on September 17 near Derna, when an attack by the Turks and Arabs made at daybreak was repulsed after four hours' hard fighting, in which the Italians supplemented their artillery fire with bayonet charges. The Italian loss was 61 men killed and 113 wounded, while the loss of the enemy, according to Italian reports, amounted to 1,000 men killed and many more wounded. The Italians took 41 prisoners, including an Arab chief. On the 20th the Italians captured the Zanzur oasis, 12 miles southwest of Tripoli, after ten hours' fighting, in which the Italian casualties amounted to 200, and losses on the other side were large. Nothing is yet definitely known as to the outcome of the unofficial conference of Turkish and Italian representatives at Chiasso, but those who are concerned in them speak confidently of a favorable progress and speedy conclusion. It is reported that Turkey insists upon being given a port on the Mediterranean, say Tobruk, and another on the Red Sea, say Massowah, in order to have access to the Mohammedan tribes of the interior, over which the Sultan is to retain a spiritual lordship. Italy is expected to assume so much of the Turkish national debt as is represented by the revenues of Libya, which amount to $200,000 a year.

A Loan to China C. Birch Crisp & Co. are said to have signed a contract on August 30 with the Chinese Minister in London for a $50,000,000 loan at 5 per cent., negotiated by A. Wendell Jackson, an American. The first instalment of $2,500,000, it is reported, was made last week. Before negotiating with China, Messrs. Crisp inquired at the Foreign Office as to the attitude of the British Government toward that loan, and were told that the field was open and free. The representatives of the six Power group recently announced that their governments, thru their Ministers at Peking, would express their disapproval of the transaction, and declared that China has no liberty to conclude such a loan agreement.——The Chinese representatives at the Fifth International Congress of Chambers of Commerce in Boston are Dr. Chin-tao Chen, Ph. D. (Yale), who was the first Minister of Finance of the new republic; Dr. Ching-Chun Wang, Ph. D. (Illinois), assistant director of the Peking-Mukden Railway, and Mr. Fao Liang, M. A. Dr. Chen states that the new administration of the Celestial Empire had never sought to obtain a loan of $300,000,000, as there had been no immediate need for that amount. It was from the six Power combine that the suggestion came for a loan of such large proportions. He explains further:

"Moreover, one of the conditions imposed by the six-Power combine was that an auditor-controller should be placed at the head of the Chinese finance department. This condition, if carried out, would have been an infringement of the sovereign power of the new republic.

"The Chinese only borrowed the money for purposes of disarmament. At present they are maintaining seventy army corps, or, roughly speaking, about 700,000 men. The proposal is to disband forty army corps, which is equivalent to 400,000 men. And then after the disbandment of this number of men the administration will have sufficient funds with which to conduct the Government, for it would take only $28,000,000, or thereabout, to disband the entire 400,000 men and restore them to civil life. The maintenance of the standing army of 300,000 men will be less than $2,000,000 a month after the disbandment. Therefore, a great amount of revenue would be left for the purposes of the civil administration.

"At present the administration's expenses, including payment of the soldiers under the control of the Central Government and the necessary expenditures for the administration of the civil Government at Peking, amount altogether to but little more than $3,500,00 a month, which is almost 50 per cent. less than the disbursements made under the old régime.

"When order is perfectly restored there will be a revival of industry and commerce. The customs reports in China have shown a great increase for the last few months, greater even than in similar periods of former years."

A Stable Monetary Yardstick the Remedy for the Rising Cost of Living

BY IRVING FISHER, Ph.D.

[This paper is to be read today at the International Chambers of Commerce meeting at Boston. No one has given more support to the movement for an international conference on the cost of living than Professor Fisher, of Yale, who, we need hardly say, is universally recognized as one of America's leading economists. We comment in our editorial pages on the highly important suggestion made by the professor in the last half of his paper.—EDITOR.]

BUSINESS men thruout the world have a vital interest in the problem of the rising cost of living. Rising and falling prices, crises and depressions, are primarily phenomena of business. Less than a generation ago the whole world was complaining of a protracted fall in prices, just as today we are all complaining of a protracted rise in prices. Then the phrase in everybody's mouth was "depression in trade"; now it is the "high cost of living." Then the principal sufferers were the debtors, the business enterprises and the profit takers of business; now the principal sufferers are the creditors, the bondholders, the savings bank depositors, the salaried classes and the wage earners. Then, as now, the rates of discount were variable and imperfectly adapted to the troubled conditions in the business world. Then the favorite explanation of the fall of prices was insufficiency in circulating medium; now the favorite explanation is a superabundance of circulating medium. Then as now the discussion revolved about the gold supply. Then as now, however, many other and conflicting explanations were offered. Then as now there were a great number of publications, a great number of official inquiries and reports. Then there were international conferences to discuss the gold question and a possible remedy in bimetallism, and now we have the proposal for another international conference to discuss the present gold question and, in general, the facts, causes and remedies concerning the high cost of living. Then as now the business men of the world were among the leaders in the movement for investigating the disturbances to business caused by a convulsion in prices.

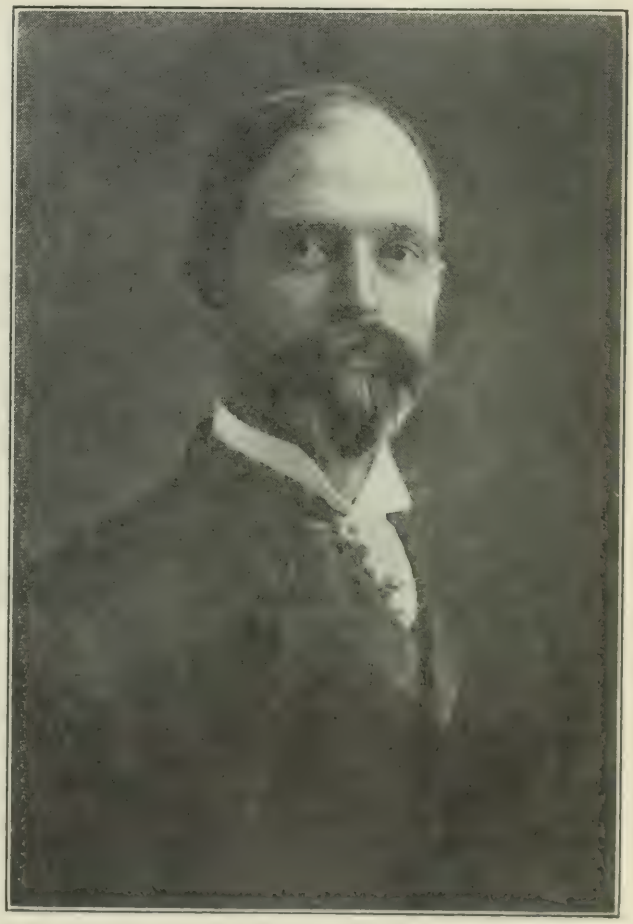
The present movement for an international inquiry thus has its counterpart in the past. A world movement in prices in either direction calls naturally for a world inquiry.

The great fall of prices ending in 1896 was often referred to as an appreciation of gold, just as the rise of prices since 1896 is often referred to as a depreciation of gold. In other words, the dollar, the pound sterling, the franc, the mark and all other monetary units in gold were increasing in purchasing power before 1896 and since 1896 have been decreasing. In both cases the purchasing power varied.

This continual variation in the real value of the dollar is the bane of business. It is one of the sources of booms, crises, contractions and depressions by which modern business men are perpetually vexed. Unfortunately, as yet, the rank and file of business men do not realize the close connection between the cycles of trade and the instability of the dollar. I firmly believe, however, that the time must come when business men thruout the world will feel the need of a more stable unit of value. Business men appreciate the necessity of a scientific determination of the yard, the pound, the hour, the horse-power, the kilowatt, etc. Governments have bureaus of standards to make sure that these units are determined to the highest possible degree of precision. Yet our yardstick of purchasing power, the dollar, the most essential and universal unit employed by the business man, is permitted to change incessantly. The whole world complained when the dollar appreciated and complained again when it depreciated. No one will deny that theoretically it ought neither to appreciate nor depreciate, but to remain unchanged. We

have, at present, a dollar of fixed weight but not of fixed purchasing power; and we shall never secure a fixed monetary yardstick until business men universally appreciate its importance. Personally, I hope that an international conference on the cost of living, while it could not be expected to secure this result immediately, may lay the basis for it in the years to come. This it might do by causing business men thruout the world to demand it. It is the business man whose fortunes are most bound up with dollars and cents. One of New York's foremost business men, Theodore H. Price, cotton broker, is now endeavoring to bring home to business men the subtle risks and losses which they suffer from an unstable monetary yardstick, and thousands of business men thruout the world are similarly alive to the situation.

It is also significant that business men are, thruout the world, the best supporters of an international inquiry to discuss this subject in all its bearings. In the United States, among several hundred prominent business men who have supported this proposal are financial editors like Samuel H. Barker of Philadelphia, R. E. Ireton of New York, statisticians like Roger W. Babson of Wellesley Hills and James H. Brookmire of St. Louis, railway presidents like W. C. Brown of the New York Central Lines, L. F. Loree of the Delaware & Hudson Railway Company, C. S. Mellen of the New York, New Haven & Hartford Railway Company, bankers like A. B. Hepburn, F. A. Vanderlip, P. M. Warburg of New York, J. B. Forgan and C. T. Boynton of Chicago, George W. Norris of Philadelphia and John Perrin of Indianapolis. A large number of business men's organizations have endorsed the movement. These include:



The New York Chamber of Commerce.
The Massachusetts State Board of Trade.
The Rhode Island Business Men's Association.
The Retail Merchants' Association of Illinois.
The Merchants' Association of New York.
The Boston Chamber of Commerce.
The St. Louis "Round Table."
The Philadelphia Chamber of Commerce.
The New Haven Chamber of Commerce.
The Worcester (Mass.) Merchants' Association.
The Wilmington (N. C.) Chamber of Commerce.
The Houston (Tex.) Chamber of Commerce.

Approval has also been given by the great political leaders, including all three candidates for the presidency.

Certainly all men, and especially all business men who realize the existing discontent and dislocations in business caused by the unstable price level, and who believe in the value of international discussion, should favor the proposal for an international conference on the cost of living as one of the potential forces for the betterment of the world.

The present movement for an international inquiry on the cost of living was anticipated by many men in many places, including especially Professor Stephen Bauer of Basle, Switzerland, three years ago, and Dr. J. P. Norton and Byron W. Holt in *Moody's Magazine* of New York City, five years ago.

In May, 1911, soon after the publication of my "Purchasing Power of Money," which included a discussion of this subject, President Hadley of Yale,

PROFESSOR IRVING FISHER

in conjunction with myself, brought the subject to the attention of President Taft. A visit to Europe in the summer of 1911 proved to my satisfaction that the leading economists, business men and officials in the chief European states were favorable to and usually enthusiastic for an international conference among the leading nations on the high cost of living. Out of several hundred supporters of this proposal in other countries may be mentioned:

Lord Courtney, of Penwith.
Lord Thomas Brassey, author of "Work and Wages," etc.
Mr. Henry Higgs, of the Treasury Department, formerly Secretary Royal Economic Society.
Mr. W. M. Acworth, English railway authority.
Mr. Francis W. Hirst, editor of *The Economist,* London.
Mr. George Paish, editor of *The Statist,* London.
Professor Alfred Marshall, Professor Emeritus of Economics, Cambridge University. Leading English speaking economist of the world.
Hon. Delbrück, President of the Imperial Statistical Office, Berlin.
His Excellency Bernhard Dernburg, formerly Secretary of State of Germany.
Freiherr von Berlepsch, formerly Minister of State of Prussia.
A. von Gwinner, Director of the Deutsche Bank of Berlin.
Dr. Gustav v. Schmoller, Professor of Economics, University of Berlin.
Prof. Max Sering, Professor of Political Economy, University of Berlin.
The Verein für Sozialpolitik in Berlin.
Hon. Raymond Poincaré, Premier, Member of the French Academy, formerly Minister of Finance of France.
M. Lucien March, Director of Statistics of France, Paris.
M. Jean Javal, Senator, Paris.
Prof. Adolphe Landry, Deputy, Director of Studies at the Sorbonne.
M. Jacques Bertillon, Director of Municipal Statistics of Paris.
M. Ch. Legrand, President of the Paris Chamber of Commerce.
Prof. Paul Leroy-Beaulieu, capitalist, leading economist of France.
Dr. Robert Meyer, Finance Minister, Vienna.
Prof. E. Böhm-Bawerk, formerly Minister of Finance of Austria-Hungary, Professor of Political Economy, University of Vienna.
Mr. C. Morawitz, President Anglo-Austrian Bank, Vienna.
Mr. Rudolphe Sieghart, Governor, Austrian Land-Mortgage Bank, Vienna.
Sr. Nitti, Minister of Agriculture, Rome.
Sr. Luigi Luzzatti, formerly Minister of State, Rome.
Prof. Luigi Bodio, Senator, International Institute of Statistics, Rome.
Mr. Lepreux, director of the National Bank of Belgium, Brussels.
Mr. G. M. Boissevain, member Central Commission of Statistics in the Netherlands, Amsterdam.
Mr. Michael Koefoed, Director of the University of Copenhagen.
Baron Y. Sakatani, formerly Finance Minister of Japan.
Hon. G. Findlay Shirras, Finance Department, Government of India, Calcutta.
Hon. G. H. Knibbs, Statistician, Commonwealth Bureau of the Census and Statistics, Melbourne.
Hon. Weedon, Government Statistician, Brisbane, Queensland.
Hon R. H. Coats, Statistician, Department of Labor, Ottawa, Canada.

On February 2, 1912, President Taft sent a special message to Congress, half of which was devoted to the subject. In this message he said:

There has been a strong movement among economists, business men and others interested in economic investigation to secure the appointment of an international commission to look into the cause for the high prices of the necessities of life.

For some years past the high and steadily increasing cost of living has been a matter of such grave public concern that I deem it of great public interest that an international conference be proposed at this time for the purpose of preparing plans, to be submitted to the various Governments, for an international inquiry into the high cost of living, its extent, causes, effects and possible remedies I therefore recommend that, to enable the President to invite foreign Governments to such a conference, to be held at Washington or elsewhere, the Congress provide an appropriation not to exceed $20,000, to defray the expenses of preparation and of participation by the United States.

The numerous investigations on the subject, official or other, already made in various countries (such as Austria, Belgium, Canada, Denmark, France, Germany, Great Britain, Italy, the Netherlands and the United States) have themselves strongly demonstrated the need of further study of world-wide scope. Those who have conducted these investigations have found that the phenomenon of rising prices is almost if not quite general thruout the world; but they are baffled in the attempt to trace the causes of the impossibility of making any accurate international comparisons. This is because, in spite of the number of investigations already made, we are still without adequate data and because as yet no two countries estimate their price levels on the same basis or by the same methods.

As already indicated, the preliminary conference itself would entail a comparatively small expense, and most of the subsequent investigations for which it would prepare the way could be carried out by existing bureaus in this and other Governments as part of their regular work and would require little, if any, additional appropriations for such bureaus.

Prior to the President's message, Senator Crawford introduced a bill into Congress for an international commission on the cost of living, and subsequent to the President's message he, in the Senate, and Mr. William Sulzer, Chairman of the Committee of Foreign Affairs in the House, simultaneously introduced an identical bill appropriating $20,000 for the purpose mentioned in the President's message. This was in March, 1912. The Senate bill, after being unanimously favored by the Committee on Foreign Relations, was passed unanimously by the Senate on April 15, 1912, and the House bill was unanimously favored by the Committee on Foreign Affairs on May 15, 1912, and reported in an elaborate report of 29 pages (No. 711); but it has not yet been voted upon and will not be until December. Its ultimate passage is favored by most of the leaders of both parties, including Speaker Clark and Floor Leader Underwood. Unfortunately it has been decided to postpone the consideration of the bill until after the Presidential campaign, lest its passage should be construed as an admission by the Democrats that the high cost of living was not confined to the United States and therefore not wholly due to the American protective tariff! I believe —and I speak as a free trader—that this was a shortsighted view to take. It is as useless to deny the fact that the rise of prices is world-wide as to deny that the sun rises. Almost every one knows it already, and many of the most ardent tariff reformers feel, that an international conference on the cost of living might lead to tariff reductions thruout the world.

It is a curious fact that the project for an international inquiry on the cost of living appeared to some in England to have the opposite political aspect. There the fear was exprest by a few that it might interfere with *raising* the tariff! It would never do to admit that the high cost of living had occurred in other countries than England, for such an admission would tend to absolve from responsibility the free trade party in power!

If an international conference is ever held, the fact that the political aspects of the matter will differ so greatly in different countries will, of itself, prevent a partisan treatment of the subject. The aim is for an unbiased scientific inquiry, and undoubtedly those who should take part in the conference would be primarily scientific men and not politicians.

The work to be undertaken consists of three principal divisions concerned respectively with the *facts*, the *causes* and the *remedies* for high prices.

Even if the conference should restrict itself to the first of the three branches, or even if its work in the second and third divisions should be of little consequence, no one who has attempted to get at the exact facts as to the rise of the cost of living can doubt for a moment that an international conference would be well worth while. It would tend powerfully to improve our knowledge of these facts. The newspapers have so glibly discussed the high cost of living that many persons assume that there exists somewhere an exact body of knowledge. But as soon as the alleged facts are brought forward in controversy, it is found that, in most cases, they can be successfully challenged. For the great majority of nations there are no exact statistics, while of the few nations for which index numbers are available (such as the United States, Canada, England, France, Germany, Austria, Italy, Belgium, Holland, Japan, India), only a few have really valuable statistics. Most countries have none at all or a very restricted range. Thus for Italy the statistics are restricted to a very few articles, and these are all articles of export or import; for Austria the statistics are confined chiefly to one city, Trieste. Even where elaborate statistics exist, as, for instance, in the United States, Canada, England and Germany, they are not really comparable. When one attempts to state that prices have risen twice as fast in the United States as in England one can not be sure of the correctness of such a comparison, for the American statistics of wholesale prices relate to 256 commodities, and those of England relate to only 44, while the two sets are averaged by entirely different methods. United States Commissioner of Labor Dr. Neill has long sought to secure some degree of com-

parability in the statistics of different countries and has welcomed the proposal for an international inquiry on the cost of living as a method of securing this result. If, as he says, no other result should accrue, this of itself would be sufficient justification for the conference. Exact knowledge must ever be the true basis for sound discussion and legislation. Dr. Neill and his foreign correspondents agree that an international conference would go far toward making possible such a degree of uniformity in statistical methods as would make international comparisons reliable.

The second advantage would be a greater knowledge of causes. To increase our knowledge of facts will of itself contribute to our knowledge of causes. But an international conference would promote a discussion of causes in other ways. Each country is at present far too much disposed to treat the problem from a local point of view. It is self-evident that a conference in which all parts of the world present views from as many different points of view will aid in creating a truer perspective.

It is doubtless too much to hope that a single conference would provide anything like universal agreement as to the causes of the high cost of living, but it might, at least, eliminate many of the existing disagreements, and narrow the discussion down to certain particular issues.

As to remedies there is still less likelihood of universal agreement. Yet it cannot be denied that the conference would help toward future remedies by giving each nation the benefit of the experience and suggestions of all. The conference would promote these suggestions in two ways; first, by indicating a number of small but practical economies which have already proven of value even tho makeshifts; and secondly, by whetting the public appetite for more ambitious and thorogoing remedies which may some time in the distant future be put in force.

Among the possible makeshifts or palliatives which deserve careful consideration are: Tariff revision, legislation regulating monopolies, co-operative devices, publicity as to prices and profits, the reduction of middlemen, the repeal of the tax on oleomargarine and of other taxes which directly affect the cost of living, municipal markets, the utilization of empty city lots, the encouragement of business efficiency, the reduction of human disease and disability, the introduction of workmen's compensation and insurance, the organization of housekeepers' market clubs, the encouragement of simplicity in living, the regulation of cold storage plants, the revision of government regulations as to weights and measures, especially as concerns the use of packages in retail trade, and the establishment of an elastic currency.

Among the more ambitious plans which aim to go to the root of the matter is one of my own. This is similar to a suggestion of Governor Woodrow Wilson that the weight of the gold dollar should be increased enough to restore some of its lost purchasing power. My proposal is not literally but virtually to increase the weight of the gold dollar by increasing the weight of the bullion on which it is based. I had intended to pass over this plan with a mere mention, but it has been suggested by the Boston committee on program that I should explain its main outlines. This I am naturally very glad to do, so far as time permits. For further and more technical details I refer you to the closing chapter of my "Purchasing Power of Money."

I have said that my proposal is virtually to increase the weight of the gold dollar. But this increase in weight would not be added to the coins themselves, but only to the bullion out of which they are made. In other words, the proposal is to restore the ancient custom of a "seigniorage" on gold coinage. At present there is no seigniorage. Coinage is free and the weight of a gold dollar is as great as the weight of the bullion which the miner takes to the mint and for which he receives back a dollar. He now takes 25.8 grains of gold bullion tc the mint to secure a 25.8 grain gold dollar. The coined dollar weighs the same as the uncoined or "bullion dollar," if I may employ such a term. My proposal is to increase the weight of the bullion dollar, that is, to require 26 or 27 or 28 grains of gold bullion to be

taken to the mint to secure a 25.8 grain gold dollar. The coined dollar would remain unchanged in weight (25.8 grains), but the bullion required to secure the coined dollar—the bullion dollar, would be heavier. The difference in weight between the two would be what is called seigniorage. It would not be fixed once for all, but would be continually adjusted so as to give the dollar always a fixed purchasing power. As the coined dollar would be interconvertible with the bullion dollar the two would always be equal in value. The ultimate dollar would be as it now is—a dollar of gold bullion—but this dollar would no longer be of fixed weight and variable value, but of fixed value and variable weight.

The adjustment of the seigniorage would be entirely automatic, dependent on an official index number of the price level. Index numbers are now familiar and well-tried devices for measuring changes in the general level of prices. The new official index number could be modeled on the well-known index numbers already in use, such as those of the United States Bureau of Labor, Bradstreet, Gibson, the Canadian Labor Office, the British Board of Trade, the London *Economist*, or of Sauerbeck, the London wool merchant. The system here proposed is, so far as I know, the only one proposed which is purely self-acting. If the official index number shows a rise of prices in any year, say 1 per cent., it would be mandatory for the mints to add 1 per cent. to the seigniorage. Exprest the other way about, if gold loses 1 per cent. of its value, the mints would pay 1 per cent. less for it. This would tend always to preserve a uniform purchasing power of the monetary unit. As soon as any depreciation occurred the increase of the seigniorage would operate to correct it. The present mint price is fixed; it is £3 17s. 10½d. per ounce of gold 11/12 fine in England, or $18.60 per ounce of gold 9/10 fine in the United States. The proposal is simply that instead of always paying the same money price for gold, no matter how much it appreciates or depreciates in purchasing power over goods, we would pay exactly what it is worth. There is no virtue in a fixed mint price for gold, but there is virtue in a fixed purchasing power of money. The proposed plan has been enthusiastically endorsed by those who have examined it in detail. It escapes the objections to most proposals for improving the standard of value. It would work as automatically as the mint now works, or as the regulation of the coinage of the Philippines or of British India under the present gold exchange standard, to which system, as I have shown in the "Purchasing Power of Money," the present proposal is analogous. The operation of the system would not depend upon the discretion of any official. I most strongly object to any system of regulating the value of money thru the exercise of judgment by a government official. Such systems are absolutely impracticable and dangerous. Their occasional promulgation has made most people suspicious of any proposal to alter the existing standard of value. Even the gold exchange standard for silver countries was looked at askance until actual experience proved its workability. The system here proposed is at bottom precisely the same thing. In the gold exchange standard the ultimate basis is gold outside of the circulation. This system has been applied only to silver countries. The present proposal is simply to apply it to gold countries and to readjust the par between the money in circulation and the gold outside so as to maintain constancy of purchasing power. The plan involves no untried elements. Its novelty consists solely in combining into a coherent system a number of elements, all of which have been tested by experience. It is not a fiat money scheme. It is not an abandonment of the gold standard. It is merely making the gold standard stable. The ultimate basis is still gold bullion interconvertible with gold coin. But this gold bullion, the ultimate source of the monetary unit, is to be of fixed instead of variable value. All nations can adopt the system without disturbing any existing coinage, paper money or banking arrangements. There would be no outward change in the appearance of the currency. Even silver countries can get its benefits if they adopt with India, the Philippines, Panama, Mexico and the Straits Settlements the gold ex-

change standard. The majority of people would never know what had happened, any more than the majority of people in India yet understand what happened in 1893. But all classes would enjoy the safeguards of a stable standard of value. Long-term contracts would be safe. Crises would be almost impossible. The fundamental reason for much unsound speculation would be taken away. The rising cost of living, so far as this means a fall in the purchasing power of money, would come to an end.

Of course, it is not pretended that to stabilize the purchasing power of the dollar would fully solve the whole problem of the cost of living. This larger problem concerns the purchasing power not simply of the individual dollar, but of the whole income. The purchasing power of a man's income depends not only on the purchasing power of each dollar, but also on the number of dollars of income he can secure. But it is impossible in this short paper to cover the whole problem of the cost of living. The branch of it which has been discussed—the problem of a stable yardstick of purchasing power—will serve as a sample of the truly great problems to be considered by the proposed international conference. These problems are not only great, but pressing. Industrial unrest is almost universal. This unrest is the direct, altho usually unrecognized result of the mighty upheavals going on in prices, with the imperfect adjustments in wages, salaries, interest, rent and contracts of all kinds. This unrest has already exprest itself in bread and meat riots and other forms of violence on both continents. Furthermore this industrial unrest, with the attendant excitement, is in turn the chief cause of our political unrest. This manifests itself in new parties and new proposals, and in a great mass of legislation to control or lower prices. Such legislation includes tariff reform, railway rate legislation, the project of a parcels post, anti-trust legislation and public utilities legislation, designed to give the consumer lower rates for water, gas, electricity, telephone and trolleys. Many of these projects are sound and desirable in themselves, but few of them are far-reaching enough to arrest appreciably the rising tide of the cost of living. Disappointment in the results expected from false panaceas is inevitable. This disappointment will greatly inflame the growing discontent and make worse the unmistakable trend toward socialism, syndicalism and violence.

Unless the problem of the cost of living is dealt with in a thoro and scientific way, unless something is done to at least help the common people understand what is really going on, discontent may turn to fury and reform to revolution. The index numbers of *Bradstreet* and the London *Economist* show that the price level of the first eight months of 1912 is 5 per cent. in America and 6 per cent. in England above the level of the year before, and the highest point yet reached in this generation. Nor is the end yet in sight. On the contrary, a careful statistical study published in the September *American Economic Review* has driven me to the conclusion that the price level is to rise for many years to come—unless something vigorous and far reaching is done. Shall we shirk the problem or shall we solve it? If we are to solve it we can do so only thru international investigation. No one nation can successfully cope with the problem single handed. It is too big. An international conference is the all important first step and this first step is all but taken. Whether or not it will actually be taken next December depends on how widespread and earnest a demand is made for it. The kind of demand which counts most is the demand of representative business men like you. If the interest in the project continues to spread among business men as fast as it has spread already, success is assured, and the way will be prepared for a statesmanlike and businesslike treatment of a great world problem.

Albania in Arms

BY HERBERT ADAMS GIBBONS

[Mr. Gibbons, whose articles on the near East our readers are familiar with, has just made a tour of the regions discussed in the following article. He has made his headquarters in Constantinople for the last year or two.—EDITOR.]

IF ever there has been a case of fools rushing in where wise men feared to tread it is to be found in the attitude of Young Turkey toward Albania during the past four years of "constitutional" government. The most successful of sultans and conquering generals in the heyday of Ottoman power never succeeded in subduing the Albanians. The Albanians acknowledged the sovereignty of the Sultan only when it was made clear to them that they would be left absolutely to themselves and that no sacrifices of men or money were to be required of them for the support of the Empire. So they allowed themselves to be included in the Ottoman Empire, for this protected them from the encroachments of other nations who would have civilized them. They have always regarded themselves as an unconquered people and as superior to the Turks in every way. The Turks have drawn more high army and civil officials from among the Albanians than from themselves, and for several hundred years they were constantly indebted to the Albanians for their best generals and administrators.

But the Young Turks from the beginning of the constitutional regime insisted upon regarding themselves as the dominant authority in Turkey. This would have been all right if they had had numerical preponderance and the moral and intellectual ability to dominate the other races. It is, however, an undisputed fact that the Turks lack the moral and intellectual qualities of a ruling race

THE WORST ENEMIES OF THE COMMITTEE OF UNION AND PROGRESS

ALBANIANS ORPHANED DURING THE TURKISH "PACIFICATION"

and that they have remained the dominant factor in their country only by brute force and the tolerance of the foreign powers. In a constitutional Turkey they were bound to give way to Arabs and Albanians, Greeks and Armenians. This they would not do, and the result has been four years of worse tyranny than under the old regime. Instead of the Sultan and his palace favorites, a secret committee of mediocre men, without administrative experience, has ruled Turkey by reason of its control of the army.

All races have suffered during the nefarious rule of this committee, but none more than the Albanians. The Armenians and Greeks, for centuries subject races, could hardly come to a worse pass than before the Constitution. The Arabs, always contemptuous of anything Turkish, are far away from Constantinople, and form too compact a mass to be easily Ottomanized. The Young Turks never dared to do much in Syria and Arabia. But the full force of the insensate policy of the Young Turks fell upon the Albanians. In a few weeks they saw their centuries-old privileges and immunities abolished, their country invaded by hordes of inexperienced officials of a race which they held to be their inferiors, their language tabooed in the schools and forbidden the printing press unless written in Turkish characters, their young men drafted into the Turkish army and sent off to Asia Minor and the deadly Yemen to be shot and, if not shot, killed by the fevers of a climate which their mountain-nurtured constitutions could not stand, and a system of taxation introduced which threatened to wring them as dry as their unhappy Macedonian neighbors. Worse than all, they were notified to surrender their firearms. To take from an Albanian his gun is worse than to cut off his leg.

The natural result was rebellion. Forgetting their internal feuds, the Albanians resisted. But they could do nothing against the thousands of trained troops, equipped with machine guns, which the Turks turned against them. The rebels were compelled to flee to their mountains

A BYZANTINE BRIDGE THAT IS STILL IN USE

as their ancestors had done hundreds of years ago, in the days of Scanderbeg. The repression of the revolts of 1910 and 1911 has never been given fully to the world. It is too horrible to recount. The Turks did not hesitate to practise against Albanian co-religionnaires the same cruelties as against the Armenians and Bulgarians. Villages were burned, crops destroyed, women violated, and every rebel caught was shot or hanged. The atrocities were so heartrending and so widespread that they can never be forgotten. The Turkish army "pacified" Albania—for one year.

This spring the first Ottoman Chamber was dissolved, and the decree issued for new elections. The Albanians determined to make a peaceful and legal stand for the redress of their wrongs. Their leaders knew well enough that it was to their interests to see Turkey strong and to remain a part of the Ottoman Empire. Altho strong autonomists, they have never been separatists. So they tried to see if the constitutional method would work. They would elect deputies who would stand up in the parliament of the nation and denounce the committee. But here the Committee of Union and Progress played the final card which was to lead to its downfall. By violence and illegal use of the army they prevented free elections, not only in Albania, but thruout the Empire, and the result was a parliament of Turks, creatures of the committee, not one out of ten of whom had been elected by fair means.

There was only one means of protest left to the Albanians. They rose again in arms, and demanded the immediate dismissal of the Union and Progress cabinet and the "packed" parliament. The Young Turks tried again their old method which had been successful in the two previous years. They ordered the army to march against the Albanians. But this time they had the bitter experience of Abdul Hamid. The army refused to march, and, in many instances, its soldiers and its officers (many of the best and highest are Albanians) made common cause with the rebels.

This time, instead of having to defend

themselves in their mountains, the Albanians have come down into Macedonia. They have taken possession of Mitrovitza and Uskub, and threatened an immediate march upon Salonica if the Cabinet were not dismissed and Parliament prorogued. The Committee of Union and Progress is out of power, a new Cabinet of their enemies has been formed in Constantinople, their packed Parliament came to a farcical end, practically kicked out when it refused to dissolve.

But Albania is still in arms. Headed by their chiefs, they are remaining in Mitrovitza and Uskub, and I have found them all along the railroad as far south as Velles and Stroumitza. Here at Uskub they are fraternizing with the soldiers, fasting during the daytime (for it is Ramazan, the sacred month) and feasting when the sun goes down. They have given the new Cabinet until the end of September to grant all their demands, which practically amount to autonomy. This the Cabinet has already done in principle, but the Albanians are chary of promises. They tell me that they have faith in the good intentions of the Cabinet, but they are not sure of its abilty to carry out its promises. What they are really doing at Uskub is to watch the Committee of Union and Progress. They fear that the committee may endeavor to get into power again after Ramazan, and in that case they are determined to go even to Constantinople to give the *coup de grace* to their enemies.

"All Albania is in arms," one of their chiefs has just said to me. "The Turks cannot massacre us as they do the Armenians. We shall stay in arms until we are assured that the Turks will let us alone and keep out of our country. We are willing to recognize the sovereignty of the Sultan if it does not mean Turkish rule. That we have never had and we do not intend to have it now. If we do not get the fulfilment of promises this year, next September will not see us halting at Uskub."

USKUB, MACEDONIA.

The Close of Summer

BY MADISON CAWEIN

THE wild-plum tree, whose leaves grow thin,
Has strewn the way with half its fruit:
The grasshopper's and cricket's din
Grows hushed and mute:
The veery seems a far-off flute
Where Summer listens, hand on chin,
And taps an idle foot.

A silvery haze veils half the hills,
That crown themselves with clouds like cream;
The crow its clamor almost stills,
The hawk its scream;
The aster stars begin to gleam;
And 'mid them, by the sleepy rills,
The Summer dreams her dream.

The butterfly upon its weed
Droops as if weary of its wings;
The bee, 'mid blooms that turn to seed,
Half-hearted clings,
Sick of the only song it sings,
While Summer tunes a drowsy reed
And dreams of far-off things.

Passion, of which unrest is part,
That filled with ardor all her hours,
Burns low within her quiet heart
As now in ours:
The time fulfilled of fruits and flowers,
From out Life's dying fires now start
Love's less uneasy powers.

All is at peace; the perfect days
Move onward to a perfect close;
A little while the Year delays,
And takes repose,
Ere to the end she, sighing, goes,
And, clothed in tattered golds and grays,
Weeps all her shadowy woes.

So is it with the heart awhile,
The heart and soul that dreams engage,
While on fruition Toil doth smile
And take his wage
Of Love, who cons Life's middle page;
Regardless of the distant stile
Where Death awaits and Age.

LOUISVILLE, KY.

Loti and "The Daughter of Heaven"

BY WARREN BARTON BLAKE

[Lieutenant Julien Viaud, Retired—better known as Pierre Loti—has written in collaboration with Madame Judith Gautier, daughter of "Théo," a play called "La Fille du Ciel"—"The Daughter of Heaven." This drama is in rehearsal at the Century Theater, New York, the home of the short-lived New Theater.—EDITOR.]

PIERRE LOTI is little known as a dramatist. Dramatizations of "Ramuntcho" and "Pêcheurs," an opera founded on "Le Mariage," a play called "Judith Renaudin," a prose translation of "King Lear," all these he has given to the theater, and yet it is as novelist, traveler and personality that his name is repeated in every country with almost every accent of appreciation. As novelist he has interpreted Brittany, and Breton seamen in all climates; Africa and the French soldier; Turkey and its "disenchanted" women; South Sea islanders and his brief love for one of them. As traveler, he has written descriptions of those lands where exotic beauty has persisted. He has treated his subjects in much the same style, finding in all things, even pleasures, reminders of the transitory nature of all life, of universal nothingness. This last is, I am tempted to say, the only idea which he ever expresses. The least academic member of the French Academy is much less moralist or philosopher than sentimentalist; much less a sentimentalist than an impressionist. Of the senses thru which Loti has received the impressions he seeks to reproduce, the most highly developed are sight and smell; but each of the five is, in his case, much more wonderful than in the ordinary man—or than in other artists. And it is obvious that in calling Loti a sensationalist one employs a more or less scientific usage—with no thought of classifying his literature with "yellow" journalism. Yellow is, besides, not Loti's color. Rose and pearl gray are his favorites; at least they are the colors which he seems to see most often in the world he vividly depicts.

PIERRE LOTI

Loti's genius is altogether personal, whereas the dramatic is held to be impartial. Yet when Loti writes a play, even tho he is only a collaborator, all the world marvels. It is his fame as an author of descriptive prose and the picturesqueness of his nomadic personality (cropping out, whatever form he essays) that makes his journeying from Rochefort to America a news item of international concern. We are all anxious to see the man who has written "Mon Frère Yves" and "Pêcheur d'Islande," and the travel books about Japan, India, Persia, Palestine, Africa, Indo-China. And we are eager to learn the dramatic significance of the work which an American manager is mounting as a great stage spectacle; to see which Loti risks a voyage to New York in his sixty-third year. Certainly Pierre Loti cannot love America for its own sake: he has even spoken unkindly of us in print. That was at the time of the Spanish War, when the rumor ran that he offered the Queen Mother of Spain to equip a privateer against the

VIOLA ALLEN AS THE MING EMPRESS—
"THE DAUGHTER OF HEAVEN"

Yankees; to man it and command it. Of course he had no such thought—or, if he had, he suppprest it; but we cannot suppose that then or now Loti has loved our Western manners. Therefore we hope that he will not now praise us for qualities which he cannot discover, or, discovering, admire.

But what of "The Daughter of Heaven"—one of the theatrical season's most heralded productions? Tho we have yet to see the play, we can read it. True, the English translation has not yet been published. So much the better: we can read it in the French of Pierre Loti and Judith Gautier.*

The scene and action of the piece are out of time, out of space. "The Daughter of Heaven" is properly taken as a *féerie*. Yet the authors announce that the action occurs in our own time, in that ultra-modern country, China. By way of introduction, they remind us that for three hundred years China has suffered from a bleeding heart. Her population has never become reconciled to the conquest by the Manchu Tatars, whose rulers sat upon the throne at Peking until the Republicans overthrew them But the present revolution is only the final triumph, the successful culmination of China's three-century struggle to oust the alien. This much Loti and his co-worker make evident in the course of an "introduction" which teems with errors of fact. How can they refer to the Taiping rebellion as occurring "twenty years ago"? The history of the Ming dynasty in the years immediately following the Manchu conquest affords, if I am not mistaken, a tragic romance not wholly unlike that of the Daughter of Heaven. Finally, Kwang Su, the Phantom Emperor, so long kept in the background by the domineering Empress Dowager, his mother, is their principal male character. Kwang's adviser, the visionary Kan You Wey, who conceived the project of reconciling Tatars and Chinese, is here called Puits-des-Bois, or Well-in-the-Woods. Emperor and minister alike are dealt with as fancifully as any one could wish.

At thirty, the Tatar Emperor is represented as having broken away from his gilded cage at Peking. He has, with Well-in-the-Woods, reached Nang King, the rival capital. He is disguised as the Viceroy of the South—a welcome but evidently infrequent visitor at Nang King. This city is the scene of great preparations. The action opens in the garden of the palace. Flowers—ponds—brooks—bridges of marble and lacquer; nothing is wanting. The talk of gardeners at work corresponds to that of the French maid with a duster in social comedy. Enter the disguised Tatar and his minister; and now we learn why he risks his neck at Nang King.

It seems he is weary of light-of-loves and opium: the prescription of his mother at Peking. He wishes to see his empire as it really is. He is distrest that there should be another imperial court so grandly held there; but he dreams of the Empress Mother of this Ming dynasty: young, widowed, and reputed beautiful. Nightly he writes verses in her honor. This Tatar is a sentimentalist of the

*La Fille du Ciel. Drame chinois. Par Judith *Gautier et Pierre Loti.* Paris: Calmann-Lévy.

grand 1830 vintage; he would have read Lamartine's "Lake" with ecstasy. Says Well-in-the-Woods: "You are as the sacred lyre whose cords vibrate at a breath!"

In the second scene of this first act the Tatar Emperor, in a more splendid disguise than in Scene I, admires the purity of the art revealed in the throne room of the Mings. To his minister he whispers of his ambition to restore the noble tradition. He gazes upon the Empress, enthroned, surrounded by her brilliant court. He assists at the ceremony of her son's consecration. And he does homage, vowing to the Empress Mother of twenty-something years his loyalty, his hope of bringing about peace and union. He describes a vision in which he has seen her, the Ming Empress, upon the throne of the Tatar Emperor. He is most eloquent, this make-believe Viceroy of the South! You have guessed the secret—the Ming Empress is more beautiful than Rumor herself had represented.

For Act II we have moonlight. This reveals the tent of the Empress, on a marble terrace. Pale marble staircases. Fragrant incense. Kiosks. Statues of Oriental chimeras. Gongs. This scene, in a novel by Loti, would be described in not less than one hundred vibrant pages. As it is, it furnishes the setting for the Empress's confession—to us alone—of her love. Later, she honors the Tatar Emperor with discreet evidences of affection. It is much against his own wishes that he retires from Nang King at this point. And none too soon. His imposture is discovered immediately after his withdrawal. That he makes good his escape is due only to a steamboat lying in readiness below. A steamboat! An anachronism if ever there was one, whatever the authors of this dream-play may pretend about its period.

Even now the Empress finds it impossible to ascribe ignoble motives to her mysterious lover. She does not suspect his identity, even when he sends her a message on a roll of silk:

Unknown to you I write, and watch apart—
Whose voice you heard (tho not my beating heart);
Whose mask you saw (tho not my naked face);
But let the Dragon conquer near and far,
Then shall I shine upon you—a fixed star—
The unmasked guardian of your sacred race.

Act III. The Siege of the Palace of Nang King. The defenders are decimated, and ready, not to surrender, but to immolate themselves on funeral pyres. Some of them do this, their Empress touching the torch to the pine boughs. A follower of the Empress describes terrible scenes in the streets of the city, already captured by the Tatars: a picture of burning, pillage, rape, mutilation. But this is nothing. The next act is infinitely more brutal: too brutal for anything short of grand opera, art's most decadent form. Here we only listen to descriptions; we are about to see with our own eyes. For the moment the Empress refrains from poisoning herself and takes refuge in flight, only because her advisers unite in urging this as her duty to her infant son. She rejects the offer of clemency extended by the Tatar Emperor, in which course her forces loyally support her. Only an ideal of fanaticism (or theatricality) excuses this folly.

When "The Daughter of Heaven" is finally staged, there will be discussions of the fitness of the first scene of the fourth act for any stage. Some will denounce this scene as depraved exhibitionism, blood-lust that almost deserves the harsh words spoken of "Salome." Others, variously, will allege that its atrocities are historic and that they are moving.

BASIL GILL, THE ENGLISH ACTOR WHO WILL PLAY THE TATAR EMPEROR

In this scene fifty executions occur just off stage; we see the flashing sword of the headsman rise and fall; we see fifty heads nailed to the city wall. It is the city of Peking. The Tatars have crushed their enemies. The boy Emperor of the Ming dynasty has lost his life—we are not told the exact circumstances, and are properly grateful. True, there may be a loss of dramatic effectiveness; but the little Emperor is one of the few really pleasing figures here; his childish person is painted with no little skill by the author of "The Romance of a Child." We do not want to see him unhappy—much less to see him butchered.

The scene shifts to the palace of the Manchu Tatars. The Tatar Emperor is aghast at the excesses of his ministers and generals. He has in vain commanded clemency; one hope remains. His union with the Ming Empress would restore peace and good feeling; would bring within his arms the woman he loves. He holds the Empress prisoner: he offers himself as lover and as an Emperor pleading for his people. But she will have none of him. Her son has been taken from her, her followers butchered. She rejects his offers and receives from him, at her insistence, a drug which brings relief. She mounts the throne of the Tatars (once the throne of her own dynasty) and dies in the arms of her lover. For she confesses, at the last, that she has refused his throne because—but here are her own words:

"I would have yielded, perhaps, if the duty you presented to me had been but a painful duty; but it would have been too easy and too sweet—for I loved you."

And there we are left; the bloody opera ends on a note which may or may not ring true in China, but sounds in our ears less tragical than false.

It is a remarkable drama, but not all its distinction depends upon excellence. Admirably poetic in certain passages, for all it is prose in form, there is a glacial coldness in certain scenes where even imperial lovers might give hints of warm blood. Praise this as reserve, if you will. As for Loti, no one admires him more than I. But he is no dramatist, and he does not excel in collaboration. (Look at the regrettable "Fleurs d'Ennui"!) And Oriental women have ever been for him more or less ludicrous playthings, collectors' bric-à-brac. . . . Surely Loti is not the proper person to give us a convincing Empress of the Ming dynasty, a lofty type of Eastern womanhood.

Loti had more to do with the hero: dreamer, opium eater. "Opium stirs the imagination," the Tatar Emperor declares. He is a being of great exaltations, and, naturally enough, of corresponding depressions. He is like Loti in having a gift of prescience, or (what is equally bad) thinking he has that fatal gift. Yet he is a sympathetic figure: above all if we contrast him with the wooden Empress.

Typical of Loti, and—for I do not wish to slight his collaborator—typical, it may be, of Madame Gautier, is this play's emptiness of ideas. As an interpretation of Chinese character or ideals it is no less barren. But the authors aimed at none of these things, and need not be severely blamed for not achieving them. What they have tried to do they triumphantly accomplish. This is the suggestion of a series of dazzling stage pictures, each beautifully adapted to the emotions which spoken word and action are designed to stir. Thus the first scene, in the garden, with blossoms and falling petals, and fountains, and chinoiseries, is an ideal background for the veiled love-making of courtly Arrow-Bearer and Golden-Lotus; for the first suggestion, too, of the Tatar Emperor's romanticism. The gorgeousness and goriness of the other scenes need no key. And what wonderful pictures they will make, staged!

So far as the reputation of Loti goes, however, all this adds nothing. Is it not significant that Paris yields the honor of producing "The Daughter of Heaven" to New York—city of wonderful stages and deplorable acting?

New York City.

Jeff

BY CORRA HARRIS

AUTHOR OF "THE CIRCUIT RIDER'S WIFE," "EVE'S SECOND HUSBAND," ETC.

THERE is a place in Georgia where long ago, even before there was any dry land, the earth appears to have sighed and lifted her brow out of the sea and wrinkled it back into a widely curving hill. You may see yet the strength of her frown that day, in the twisted strata of molten rock, cooled now forever into those naked layers of gray granite that hold verdant terraces of soil between. The ridge of it bristles with a thick growth of pines. In the green socket below glistens the little mountain village of Brandon, white-lidded and smoke-fringed. The hill behind it wears a maternal expression, as if she had been up with it all night, as if she had nursed it, and loved it. The earth has a way now and then of crooking her elbow around some place, of drawing it close in the hollow of her arm, or of lifting it upon her breast. And when she does, that place has always a blessed look, not hallowed, but humored, like the favored child of an indulgent parent. Brandon enjoyed this distinction, which is its only distinction. It has no factories, no industries; no great man was ever born there, and no monument in it commemorates any man or deed of man. The streets are yellow and dusty, and there are weeds and sunflowers and roses in every dooryard. The population is about equally divided between whites and blacks. And it is the peculiarity of these two races in such Southern villages that they may live side by side with only a ragged fence between, upon neighborly terms of mutual helpfulness and good will, without ever "mixing" socially.

Such a town is Brandon. A stranger from the bustling world outside must feel a sort of contemptuous impatience passing thru it, observing the languor of the citizens, the indifference with which they neglect even the natural resources about them, the peacefulness with which they sit tilted back in their split-bottomed chairs beneath the awnings of their stores whittling sticks and discussing the relative merits of politicians, or of such doctrines as "predestination" and "fore-ordination." But there are two ways, at least, in which men progress in the scale of things. One is to harness the innocent creek that runs thru your town and belt it up into an electric light plant or a flour mill, and charge everybody too much for lights or for bread. The other is to keep on sitting still and whittling until something immense leaps out of the stagnation about you, as if nature had become impatient and produced of itself a hero or a demon. Nature, you know, abhors any kind of a vacuum, and there never has existed a community so listless and shiftless that sooner or later she does not fill it with the personality of one man, or the noise of some deed worthy of a strophe in Homer's "Iliad."

Now, the events I am about to set down here took place in Brandon. As a matter of fact, the place for tragedy has not changed since the ancient Greeks laid the scenes of it in remote places. To this day, as then, the greatest heroisms and sorrows of the human are to be found dramatized upon distant farms and in out-of-the-way villages; not in crowded cities, where sensibilities are confused and deadened, and where there is not enough bare space and silence for a Pro-

metheus to lie bound and think out adequate curses for his woes. And if this introduction seems too potential for the story that follows, the answer is that we have too much glorifying history of great people and not enough intimate literature about undistinguished men and women. They are merely numbered in the census reports or added up and tabulated in some book on slum economics in a great city. But if the circumstances I am about to relate had occurred in a great city they would have lost their signficance and dignity. The hero of this story was probably never counted even by the census takers, being always drunk at the time, and far from visible to any white man who had troublesome questions to ask.

Brandon, I say, had never produced a hero, but it had produced a sort of colossal bad man, which, if you think about it, is next of kin to heroes, and the primitive method nature often takes to evolve something great—nature that is not at all concerned about goodness, which is too limiting an adjective for her notion of greatness.

Jeff was this bad man. He was six feet two in his ragged, heelless, brogan shoes. He was black with an uncompromising blackness of skin, which proved that his blood was still pure African thinned by no drop of the white man's. His arms were too long, and the thumbs of his immense hands had a way of sticking out squarely as if it had not been so long since they were the bracing back claws which enabled him to hang securely suspended by them from the branches of trees. His head was simply an extension of a very thick neck protected with a skull, and his countenance was a scandal upon the image of his Maker, if you considered it from the scriptural standpoint of symmetry. Yet it was a good face in this particular, it did what many a beautiful Caucasian face, produced by ideality and mentality, rarely ever does. It interpreted truthfully the nature of Jeff, not the delicate, nose-refined sensibility of, say, the white man's ancestry. His forehead was narrow and retreated honestly, altho he was not really more vicious than many an Anglo-Saxon with a lofty, Shelley-curving brow. His nose was flat, his lips wide and thick, his chin coarse and strong and fringed with little kinks of black hairs like kinks of the same kind on his head. He had no eyebrows worth mentioning, for the shadows lay so deep in the small black pupils below that nature probably economized by leaving off the garnishment of hair so necessary to shade the feebler, less significant, paler eyes of the white race. And he had a voice so hoarse and strange that it came up out of his chest like a dangerous noise out of a jungle at night. He was neither good nor good-tempered. These are two things that we have developed thru inferiority to others, or to the conditions which surround us. Kings and savages do not cultivate them except under compulsion. Jeff had sprung from the loins of the African jungle, where strength and awful courage, not righteousness, were the cardinal virtues.

He must have had a kind of artificial surname at some earlier period in his biography, but when he arrived one day in Brandon, walking beside a cart drawn by a little yellow muley-headed bull, which he was guiding by the frazzled rope line, he had shed his surname as a dangerous identifying superfluity. Besides, he did not need it, any more than Henry VIII needed his Plantagenet tag. The historians might stickle for it, but for himself it was enough to be Henry VIII, and for Jeff it was quite as much as he would bargain for to be Jeff. He was a man who occasionally burned the bridges behind him, even to that last portcullis between him and the past, his other name.

On the summer evening, ten years before this story really begins, he drove into Brandon as I have described, clad in a ragged shirt and a pair of equally despairing breeches. He swung back with one hand upon the rope line, and in the other he carried a short, thickly plaited leather whip, with which he continually smacked the back of the little yellow bull, who did not seem to mind. In the cart were stored all of his household goods and his entire family. The former consisted of a tin bucket, a skillet, and a bundle tied up in a patchwork quilt of astonishingly gay colors. The latter consisted of two half-grown negro boys and two small girls, and his wife, Moll, who sat upon a board laid across the sides of the cart in front. She wore a flowered

Mother Hubbard belted down with the strings of a blue checked apron, an old splitboard bonnet turned up at the sides for coolness, and an expression that has been worn off and on by all women since the days when the first one understood what marriage really is. It is a curious expression, the one aloof, unconquerable thing left her, a trance look which for a time proclaims her escape from the powers that be. If you speak to her when she has it on she will answer you, but she doesn't really hear you. If you command her she obeys, but she is not really there. If you kiss her she submits, but so long as that look lasts she is a virgin and you cannot really possess her. And for one, it would not surprise me if some of the women who have suffered too much in this world do not embarrass God with it when they stand before Him for judgment on the last day.

The citizens of Brandon stared at this singular group as it past along the quiet street, down into the deeper eternal shadow of the hill, where scattered cabins indicated that portion of the town given up entirely to a negro settlement, and the figure which attracted most attention was that of the woman. It was apparent that she was neither a mulatto nor a pure-blooded negro. As a matter of fact, she was one of those damaged fragments left over from a vanished race. Her father had been a Cherokee Indian and her mother a mulatto slave. Nothing is more certain than this, that the mixing of white blood with negro blood is immoral, but the mixing of Indian blood with negro blood is tragic. There is compounded a human being in whom one ferocity contends with another ferocity, license with wildness, tropical temper with cool cunning. Moll, seated in forlorn dignity in the front of the cart, with folded hands, strands of her straight black hair hanging about her ears, and with her negro features strangely lifted by the Indian nose bridge and prominent cheekbones, was the very embodiment of this tragedy. The children, lounging in the straw against the bed quilt bundle behind her, were oddly handsome, with the red of her skin deepened in theirs to a glowing fiery brown.

Having bestowed his family in the most remote and disreputable of all the cabins, and staked his little bull upon the green terrace behind it, Jeff became a citizen of Brandon by sundown of that day —not a prominent citizen, you understand, but one of overwhelming influence. He carried forward three distinct careers with a courage and success given to few men of any quality. This was because he chose them according to his instincts and necessities rather than arbitrarily according to the needs of society, as is the custom of men further advanced in the scale of things. First, he was a slate quarry man, not from any ambition to advance himself as a workman by his skill, but to earn sufficient means to put a little bread into the mouths of his family, and chiefly to get drunk and gamble on Saturday nights. Second, he was the father of his family, the invincible head of it, and he had Old Testament notions of this relation that would have done better credit to some of the elder patriarchs recorded in Leviticus. That is to say, being quite loose in his own morals, he was as careful of Moll's virtue as Abraham was about Sarah's. Even more so, for by way of keeping the feminine in Moll completely loyal and subjugated to him, he was accustomed occasionally to beat her, on general principles, which is as good a reason as any for chastising a woman, and Moll was accustomed to crook her elbow over her head at such times and accept this fierce testimony of his continued interest in her with the stoicism of her Indian progenitor. She never protested against the injustice of this fierce manifestation of Jeff's uxoriousness. In fact, she was virtuous, and could, therefore, afford to endure his surveillance and jealousy. She understood and even sympathized with the detached intelligence of a mere observer, with his husbandly anxiety. In a race where wives so often take French leave of their marriage vows, it is natural that a man should keep his eyes open and his hands raised threateningly against such widespread unfaithfulness. Therefore, on an average, Jeff beat Moll every Saturday night, or, if he returned from his debauch too late or too drunk, he was sufficiently irritable from his excesses to attend to this rite on Sunday morning. No one ever interfered, as often happened when other negro men in the settlement chas-

tised their wives. This was due in part to the fact that Moll accepted her beating as one of the singularities of the married state for women and made none of the usual outcry commonly indulged in by the afflicted negro wife. But chiefly Jeff escaped punishment because of his undisputed pre-eminence in his third career, that of being a "bad man" of the town. You do not attempt to teach domestic amiabilty to a man who is no respecter of persons, and who is known to be willing and sufficiently fearless to kill any one who dares to argue such a point with him.

There was a derrick at the slate quarry on the mountain, two miles from Brandon, where Jeff worked. It was run upon a cable and managed by a pulley. So long as this machinery worked properly, it was perfectly safe. If it did not, a man was apt to find himself seated in the little barrow five hundred feet above the level ground, swinging like a bird nest in the wind against the sheer mountain side. Once the victim, overcome by terror of the threatened slipping of the barrow along the cable, and no longer able to endure the strain, leaped over the side of it, turning over and over like a forked stick as he came down to his death. One day, soon after Jeff began working there, another man was caught in the derrick just before it reached the level top of the mountain, where it was his business to load the thing with slate during the day. This was a Welshman, famous for his nerve, and well paid because it was not easy to find a quarryman who was willing to risk this daily trip in the little iron pouch. The derrick stopped with a jerk on the cable. The chain stuck in the cogs of the wheel, and the little engine, snuffing and pouting in the shed below, strained in vain to move them. The engineer shut off the steam, ran out, looked up at the derrick lodged nearly a thousand feet above. The man in it looked down.

"What's the matter?" he screamed.

"Chain's locked somewhere!" yelled the engineer.

From all directions the quarrymen gathered, shouting and gesticulating to the man swinging in the derrick. His head bobbed, he was seen to stand up and sway from side to side, shaking the chains that held the derrick to the rod above it.

"It's comin' on him, the dizzy fear," said one.

"He'll leap in a minute!" said another. "They all do it. A man can't be brave with nothin' under him but a thousand feet of atmosphere!"

"That chain's locked not five inches above his head. All he's got to do is to reach up and pull the link straight."

"He'll never do it—lost his head. Fixin' to jump!"

At this moment Jeff, clad in a sleeveless undervest and a pair of trousers, the pallor of gray slate dust covering his black face, advanced to the cable, holding his arms half crooked, as if he had but recently ceased to use them as forelegs, lifted his head and called up to the panic-stricken victim.

"Wait! I'm comin'!"

Then a hundred men witnessed the astonishing sight of Jeff walking easily up the almost perpendicular side of the mountain, hand over hand on the cable, one foot on either side of it, stepping along straight up like a huge, black, long-legged fly without wings.

There was a period of suspense, when minutes hung back and made hours. Those who watched, strained, bent double, groaned, as the negro climbed steadily on, never pausing to rest or to get his wind. The Welshman declared afterward that he could see a broad smile that slit Jeff's face from ear to ear, and that he distinctly heard him snicker as he showed himself over the edge of the derrick. As a matter of fact, the fellow fainted as Jeff stepped into the thing, straddled his limp body, reached up and pulled the link in the chain straight. Immediately they slid slowly down the cable amid the cheers of the quarrymen below. Jeff looked at the men, nearly all white, as if he thought they must be fools, took up his drill and went back to his place, where he had been tamping down a charge of dynamite when the confusion over the derrick arose. In fact, he was right. Nature creates different standards of courage for different men. The aboriginal ancestor of Jeff was doubtless what scientists call a "sport," who had sprung from a line of beings that did much climbing and swinging by their forelegs. But your white man was another kind of spirit. His aboriginal fam-

ily must have come up out of the sea, bleached, softer, easily dissolved from one race into another, brave, with a windy, staring courage, and mild, like the waves in gentle weather. The seat of his courage is never to be found in his forelegs, nor anywhere in him, if you take his feet off of a solid foundation. He is Antæus with a stone bruise on his heel in midair, where Jeff was much more at home in his sensations.

But, coming back to Jeff, on this day of which I have written Brandon had its first real sense of him. And Brandon was alarmed. To have a brave man in your midst whose courage is intelligent, developed, say, even by the exigencies of war, is one thing, but to have one whose courage is natural, not intelligent, nor limited by any sense of fear or danger, is another thing altogether. One might as well get a goodnatured jungle cat and turn it out in the community. So long as things went to suit it all would be well, but if ever they did not? That was the question. It was known to the authorities that Jeff was a drunkard, that he gambled, that he beat his wife and occasionally "cut" another negro, but these were characteristics of a race, not of him in particular. But this nerve which enabled him to bend his back, walk a thousand feet up the perpendicular side of a mountain, and have so little idea of his own performance that he could snicker in the face of a frightened white man at the top, required consideration. There is a high tariff on some kinds of courage.

Up to this time Brandon had not had even a "calaboose," much less a jail. The jail was ten miles away, at the county seat. But it was moved, seconded and carried at the next meeting of the town council that a calaboose should be immediately erected in Brandon.

This building was a queer affair, and gives an adequate impression of the gentleness of the citizens of that place. You may see it there to this day—a concrete box about the size of a pig pen with a tin roof, with the names of the council, mayor and marshal scratched on it while the cement was soft. It is a kind of monument to their simplicity. In the lower corner on the back side, which faced upon the creek, there is a hole in the concrete, ragged, round, and of sufficient size to permit the passing of a man's body thru it. The place has been patched, of course, but you will easily distinguish the new cement from the old. This hole was made by Jeff one Saturday night between twelve and two o'clock. At all times he was a raging lion about his own fireside, but more so on Saturday night, when, hot with drink and suspicion, he would suddenly leap to his feet, where he had been squatting with some other negro in a crap game, maybe in the engine shed at the quarry, rake up all the nickels and dimes in sight, and take his departure, growling dreadful threats.

This meant that he had reached that stage of intoxication where he was convinced that Moll had a lover. He would stride along, a blacker shadow against the dark hill, creep up to the back of his cabin, bend first one red eye and then the other to some crack between the logs, and stare in. Usually he would see his four children asleep upon the pallet in the corner and Moll squatting Indian fashion before the fire, with that long look in her eyes as if she saw a path thru all the forests in the world. She always sat thus when Jeff was late. She probably preferred to take her beating before retiring. Or it may be that she enjoyed a high mood upon such occasions. Women often do when they are about to suffer something.

What Jeff wanted to know was why she sat up. For whom did she wait? In any case, he would go in and attend to her! The next moment he would dash the door open, the blaze of the fire would blow this way and that in the chimney, a little puff of smoke would lose its way and dart out into the room. Moll would lower her head, throw up her elbow to ward off the blow without ever looking around. In a few minutes the business would be over. Jeff would fling himself, grumbling righteously, across the bed, with the drunken uneasiness of a man who must excuse himself for the duty he had just performed. He held with Cæsar that such a man's wife must be above suspicion, altho he was not able to quote this excellent authority upon female virtue. When she heard him snoring Moll would creep around on the other side of the bed and lie down beside him.

But on this particular Saturday night

he had come upon his wife actually leaving the cabin. She was really going to the woodpile for a log for the fire. But how was Jeff, being drunk, to know this, even if she had told him? The affair would have progressed and ended as usual if he had found her in the house. but, being in the open, the Indian in Moll took to her heels. She made no noise about it, but she ran with the fleetness of her race. Jeff stumbled after her. He was not at his best, owing to the liquor he had drunk, or he could have overtaken her. As it was, the marshal of Brandon, making his last round for the night, was astonished when a woman ran past him, her long black hair streaming behind her, and her garments flapping about her like frightened wings. He looked back, saw Jeff following. He thrust out his foot and tripped him. A crack on the head with his club made it easy to handcuff and bind him. The calaboose was only a few yards distant. He dragged his prisoner to it and thrust him in before he entirely regained consciousness. Moll turned the next corner and paused. She had really been almost enjoying the race. Now she missed the familiar fury of Jeff's drunken footsteps. She was alarmed. She went back and beheld the marshal locking the door of the calaboose. She understood. All her wifely devotion was aroused. She would have rescued him if the little guardhouse had been an ironside. All virtuous women are queer about their unvirtuous husbands. They practise more loyalty to them than others get the opportunity to practise for good husbands. Moll sped with double fleetness back to her cabin, chose an axe and a crowbar, and returned to the calaboose. In an incredibly short time she had made the opening that has ever since been credited to the prowess of Jeff. She crawled thru it, cut the rope that bound his legs, helped him out, and they spent the rest of the night filing off his handcuffs.

These incidents will give you some notion of the nature and character of Jeff. But I am coming now to the events which really distinguished him as a father, as a member of society, and as a servant of God. For you never can tell whom the Lord will choose for His anointed. You can only make sure that it will not be a Pharisee, but never that it will not be some great chief of sinners.

As his sons reached manhood they became replicas of Jeff in that they were drunkards and gamblers. But they avoided labor as a bondage unnecessary. Jeff accepted them as a matter of course, but he had the same Old Testament ideas about taking care of his daughters that he had shown toward his wife. He was resolved that they should be virtuous.

Mary, the elder girl, endured his tyranny as long as she could, then she went astray. The trouble with Jeff was that he was an ascetic for his womankind, and, since he permitted no opportunities for Mary to get a husband, she took a lover secretly, a young quarryman as worthless and as dissolute as her father.

In his later years, since Moll had grown old and wrinkled, his heart often failed him on Saturday nights. He had lost interest in protecting and chastising her. His ferocity and suspicions were now transferred to Mary and Nannie, his two daughters.

Late one afternoon Jeff came in in time to miss Mary, who had gone to meet her lover. Moll, like many another old and innocent mother, never suspected a lover, but Jeff, being still too much of a man for innocency, understood.

He went out, sat on the doorstep and waited.

"Whar is yo' been?" he demanded a few minutes later, when the girl appeared, walking hurriedly.

"To town," she stammered, beginning to tremble.

"No yo' ain't been to no town; yo' been to the quarry."

She stood before him, silent, tall, red-brown, with her mother's forest-clear eyes fixed in wide terror upon his face and holding to a little fold of her cotton dress in each nervous hand.

Jeff arose, the whites of his eyes suffused with blood, bent forward, looked her over up and down, measured her line for line, and reached the right conclusion. And here you come upon a fact worth setting down, that a father, any kind of a father, loves his female offspring more than he does the female who is his wife. The former is kin to him, blood of him, you understand. He

protects her differently for that reason, while in the latter he protects only his honor by holding her accountable for it. Moll, inside the cabin, flattened herself against the wall during this inquisition, staring fearfully at her daughter thru the open doorway. She expected, when she understood the girl's condition, which was now apparent to her for the first time, that Jeff would kill her. She knew that this would have been her own fate. Her standard of estimating the human male was wrong, therefore she was mistaken.

"I know who yo' been meetin'. I seen him lookin' at yo when yo' brung my dinner pail to the quarry t'other day. And I'm goin' t' tend to him tonight!"

All this he said with his bloodshotten eyes fixed upon her face, with his huge black hands knotted, his arms crooked and his powerful shoulders drawn up till his head looked like an immense terrapin's sticking out between them. The girl dropped upon the ground where she stood, covering her head with her arms. He stepped over her as if she had been some kind of refuse. The next moment Nanny, coming from the spring with a bucket of water, met him running down the path feeling the edge of a long knife with his thick black thumb. He left off long enough to slap her, then ran on. It was just as well to be beforehand with this punishing of your female. They were sure to betray you sooner or later, anyhow. This was the translation of the blow.

There was at this very time a revival in progress at the colored Streaking Head Baptist Church in Brandon. What the significance of this term means I am unable to tell, but it is a fact that there is still in Brandon a colored Baptist church where a large membership worships God according to the tenets of the "Streaking Heads," whatever these may be. It stands high upon the brow of the hill, among the pines, brown and ugly, with a sort of pigeon house steeple balanced upon the front gable.

Jeff concealed himself in the adjacent pine thicket and watched the congregation gather. It was Saturday night, and the crowd was unusually large. He felt singularly at home and peaceful, like a man who has at last found his native element and his natural vocation. Lying flat upon the ground, belly down, head lifted, eyes fixed upon the yellow oblong square of light, darkened every moment by the form of some man or woman entering the door of the church, he watched and waited. Coming from far away he heard a strangely soothing sound, the chorus of the jungle, that African forest that lay so deep in his own breast. He was the king of that land, the husband of many wives, all virtuous, the father of many daughters, all chaste.

Time passed. It was nearly eleven o'clock when he was aroused from this savagely royal reverie by the noise of singing and shouting in the church. He remembered that he had a certain thing to do. He arose, gripped his long knife firmly and crept to the door of the church and looked in carefully, searchingly. He wished to make sure. It is wrong not to be particular when you choose the victim of such wrath. He could see women leaping to their feet, running to and fro in the aisles, shouting "Glory! glory! glory!" and slapping their hands together. He saw the black polls of many men motionless—negro men never shout. He observed the "mourners' bench" with its heavy freight of penitents, the women swaying to and fro on it, the men sitting beside them in deep dejection. He heard the wild melody of the hymn above the uproar of the shouting women and wailing penitents:

"An' de prodigal son come home by hisself,
by hisself, by hisself,
An' de prodigal son come home by hisself, by
hisself, by hisself!"

Each stanza rolled forth louder and louder until it became an unearthly cry, woeful and terrible.

During a pause in the singing he saw the preacher, an old man with cotton-white wool and beard and glistening black face, swaying with outstretched hands to the congregation, crying:

"Ain't dar another brick dat's willin' to fly out of Satan's wall tonight?" he cried.

Sure enough the brick moved. Another prodigal arose and started home by himself. This was a tall, slim, young mulatto man, seated far back in the church until now. He had escaped the

searching eyes at the door, but at the moment when he stepped into the aisle with bowed head and advanced toward the "mourners' bench" there was a fearful apparition behind him. The gigantic figure of Jeff slid in out of the dark. His black face was rigid with fury, his lip curled up, showing a row of wide white teeth. He was in his quarry clothes, half naked to the waist, grimy, bareheaded, carrying a long knife in his hand. And he came in bent nearly double, creeping swiftly, having closed and locked the door as he entered. The curious, silent backward look of the people in that instant of time caused the prodigal to look back. Then the awful chase began. The young man leaped in the air and fled down one aisle between the astonished mourners and the still more astonished preacher, up the other aisle, Jeff springing along behind him. Both were silent, both intent, the one upon escape, the other upon vengeance. As he passed it, the mulatto gave the door a wrench, found it fastened and began his second circuit of the church amid indescribable pandemonium. Some, not recognizing Jeff in the distorted features of the man who brandished his knife, thought the devil had appeared among them. Women screamed and blocked the aisle, men leaped thru the open windows, yelling as they ran. Mary's lover followed this example just in time. But he was not able to elude Jeff, who followed immediately after him. For one moment longer the two men were visible as they ran down thru the pines and shot over the brow of the hill, terrible figures in the moonlight.

No one ever knew the issue of that chase. Some declared that they had heard a frightful scream not five minutes after they disappeared. Jeff declared next day at the quarry that the man had "got away from him." No one questioned him further. It was understood that whatever happened he was entitled to his vengeance.

In any case Jeff appeared at his cabin door in the dawn of the Sabbath morning as calm and peaceful as if he had wrestled with an angel all night and had got the proper victory. Never before had his family seen him in such a mood, gentle with a kind of wisdom, as if God had just informed him of something. He went in and found Mary and Moll sitting side by side before the open window. They had not lain down during the night. They had exchanged no confidences. Their silence belonged to those great scriptures of sorrow and suspense to which women in every clime and of all ages have contributed so much.

Jeff looked at them, then he went back into the shed room and called his two sons who were sleeping there. He ordered them to dress and come in to him. Next he awakened Nanny, asleep on the pallet beside her mother, and when the entire family was gathered before him Jeff delivered himself of a remarkable speech and ascended in the scale of things accordingly. He went to the bucket on the shelf beside the door, dipped up a gourdful of water and drank it. He replaced his large knife upon the ledge of board above the door, leaned against the jamb of it, and said slowly, like a judge giving a sentence from which there is no appeal:

"Yo' all know that Mary has disgraced herself and us, and she has to take her punishment. From this day she ain't to go no further from this house than the shadow of it reaches on the grass, and she's got to serve us and wait on us. She's got to do the work while we sets down. That's right after what she's done. But she's my child an' if ary one of yo' pints the finger of scorn at her, if yo' so much as names her shame to her, I'll kill the one that does it, so help me God!"

He looked from face to face and raised his arm with a solemnly menacing gesture.

All this time old Moll had sat with her back to him, to all in the room, gazing out of the window. She did not move. The young men arose and went out, Nanny stared from one to the other; but Mary lifted herself with downcast eyes from the chair where she had sat so long that her limbs were stiff and began to prepare the morning meal.

This was the beginning of her terrible bondage, which lasted for many a year after the coming of her still-born child. Nanny grew up and married. The young men ran away to escape arrest for

their crimes and were heard of no more. And from that day old Moll never performed another task for her family. You might say that she returned to her tribe, that she dismissed Jeff and his children from her mind. She wandered at will day and night in the woods and fields. Her husband no longer challenged her liberty. You do not run after an old broken gourd when it falls and rolls down the hill. There is no doubt but that she suffered more on account of the shame of Mary than any other member of the family. For, you understand, she was clean beyond mere chastity. She had been purified a thousand times beneath Jeff's scourging hands. No nun could have achieved in self-imposed penances such awful sanctity as this of the old wife and mother who had suffered all things in silence. Many a night she might have been seen squatting Indian fashion before a fire of blazing sticks in the pines upon the brow of the hill, staring before her in the hot coals as if she were in the spirit with her fathers. It came to this, that Jeff was afraid of her, not physically, but religiously. She had changed into an old, mysterious burning bush upon his path, and he deferred to her timidly, like the unsightly anchorite of some sibyl.

You could not have told which was the most tragic figure in this wretched cabin, the young Magdalene, slaving in awful fear of her father; the old wife, silenced and wrinkled, superior to all fear; or the man himself, risen to the dignity of taking and making a human sacrifice of the man who had dishonored his house.

But this was the state of affairs for some years after the events I have mentioned. Then one of those things occurred, ludicrous in its intent, sublime in its consequences.

After Mary's trouble Jeff gave up his place at the quarry. A man does not like to work with other men when his daughter has become the mother of one of their chance children. He rented a field and eked out half a living on it. This was enough, because Mary began to take in washing for the white people, and really supported what was left of the family in this way. It was the charge Jeff made for bringing in the soiled garments and delivering them again washed and ironed. He drank occasionally when he had the means with which to purchase liquor, but privately, like a man who does not trust a loosened tongue. Sometimes when he was very drunk he made a secret pilgrimage to a certain ravine upon the far side of the hill, where there was a bulge in the bottom of it about the length of a man's grave, covered for many a day with a suspiciously luxuriant growth of brambles, as if the soil beneath was surpassingly fertile. He would sit down and stare at this spot a while, until he was drunken to insensibility.

Now, it happened that there was a young white man in Brandon who was called a humorist and supported his reputation with practical jokes. It was a mistake, of course. He was simply a brute with teeth to his smiles that were as cruel as the tusks of a wild boar. But this is neither here nor there. One day when this man had been hunting, as he was coming out of the woods he saw Jeff hoeing corn in his field. He concealed himself in a deep gulley near by and, when he heard the sound of a negro chopping above, he called out in an awful voice:

"Thy sins are forgiven thee! Go and preach my gospel!"

The old man (for he was now nearly sixty years of age) paused, took off his hat, looked up at the bright June sky, over the field in every direction, and then went on with his hoeing. He thought he had been dreaming. But again, louder than before, he heard the same voice, very near him:

"Jeff, thy sins are forgiven thee! Go and preach my gospel!"

He stood still, listening. The sweat ran down his face.

For the third time he heard the miraculous reprieve, the incredible command. He could doubt no longer. He dropped the handle of his hoe, raised his arms high above his head, and cried:

"Oh, Lawd, Gawd, Master, I'm so thankful, I'm so thankful! I made sho I was damned for what I'd done!" He fell upon his knees.

It was a good joke, of course. The man in the gulley laughed until he gasped. He held his sides and snickered. He held his nose to keep from snorting

and thus betraying himself, which was fortunate. For Jeff, unsuspecting, left his hoe where it lay and went to proclaim his redemption. He ran from cabin to cabin, telling how he had been redeemed and called to preach. No one doubted his story. Every negro has more faith than common sense, and Jeff never questioned his ability to do what had been required of him. He arranged with the pastor of the "Streaking Head Baptist Church" to fill the pulpit the following Sunday. And he undoubtedly filled it to overflowing. The people came from far and near to hear the man who had got such a direct call to the ministry, and with one accord it was agreed that such another sermon had never been heard in that place. It is a fact, Jeff was inspired by his faith, and he had a liberty in his deliverance that many a prelate might have coveted. He gave his experience, described such agonies of the soul as one could scarcely believe him capable of suffering. Then, amid the shouts of hysterical women and the groans of men, he described his redemption in the sweet June field, standing waist high in the corn, like a swimmer in the Sea of Galilee.

Years have past since that day. Moll, after accepting her husband's conversion with the same patient enigmatical silence with which she endured his crimes and cruelty, was gathered to her fathers. Mary also past, having served her long sentence with fear and trembling to the last. But Jeff still lives, an old, withered, bent, black Timothy, who wanders from town to town preaching the gospel with ever-increasing fervor. The Lord has blessed him and caused his face to shine upon him as graciously as if his "call" to the ministry had not been a practical joke. Faith is a great thing, greater than love, in spite of the opinion of St. Paul. It is the one amazing experience in a man's life that can literally change it from the way of darkness to the way of light. It works a miracle inevitably according to law, which neither scientists nor philosophers can explain.

NASHVILLE, TENN.

True Progressives

BY AMOS R. WELLS

THERE are who tread the grooves of time,
With clumsy steps and slow,
Whose filmèd eyes behold no crime,
Whose ears are deaf to wo,
Whose feet are plodding to the rime:
"It always has been so."

And those there are whose pulses thrill
With high adventurous life,
A-leap to master any ill,
A-thirst for noble strife,
Their thoughts alert with trenchant skill,
Their speech a cutting knife.

They traffic not with gain or ease,
They pay no pledge to fear;
While men they pain or men they please,
They hold a steady spear;
Nor dally with the golden keys
That foulnesses ensmear.

They meet, and spirits join in one;
They call, and armies rise;
They march, and triumph like the sun
Athwart the welcoming skies;
They strike, and shades of evil run,
The heart of evil dies.

They ever know a better morn,
And hail a happier day;
For them the times are newly born,
The year is always May;
Thru cheers or hisses, palm or thorn,
They keep a sturdy way.

Thus brother-hearted, hand and glove,
Right merrily they go;
For they are swift in what they love,
And strong in what they know;
Their faith is aye in God above,
Their trust in men below.

AUBURNDALE, MASS.

Literature

War and Peace

It is rare that we have on hand two books in such complete contrast as Homer Lea's *The Day of the Saxon*[1] and David Starr Jordan's *Unseen Empire*.[2] President Jordan regards war and the preparation for war as wasteful, unnatural and absurd. General Lea looks upon it as a normal and necessary form of the perpetual struggle of nations. It is the measure of their greatness, the assurance of their success.

"Militancy is the palladium God gives once to each race. It is His token of their equality." "Individual strife is the epitome of selfishness; war a gigantic altruism. Nations as individuals exist always in a state of potential combat. The degree of combative potentiality merges unperceived from the passive, which we call peace, to the active, which is known as war. War exists long before the public consciousness is aware of it, since nations, especially those in a low state of militancy, conceal from themselves as long as possible this transition. The dead may be upon the field before they acknowledge it, yet they have in reality been at war for an indefinite period of time."

General Lea writes in a dogmatic and epigrammatic style that gives to his ideas more effectiveness than in our opinion they deserve by reason of their validity. In his previous volume, "The Valor of Ignorance," he declaimed against the peaceful spirit of the American people and prophesied the invasion of California by the Japanese. In the present volume he strives to show that the fall of the British Empire—or in words he uses as synonymous, the ruin of the Saxon race—is inevitable. "Saxon" in his sense by no means includes the Saxons. Altho much of his argument is based upon conceptions of racial purity, unity and characteristics, yet he disregards real ethnic relationships and handles the accidental political divisions as the factors in the struggle. Of England's three foes, Russia, Japan and Germany, whose lines of attack he considers, he regards Germany as the most dangerous. And here, altho we do not in the least share his belief that war between these countries is either right or necessary, it must be confest that his analysis of the situation is worthy of consideration, for the growing stress between Germany and England affords not a little support to his theory of the irrepressible conflict of convergent nations. His conclusion, exprest as usual in the abstract form of universal principles, is as follows:

"The German Empire is less in area than the single State of Texas, while the Saxon race claims political dominion over one-half the landed surface of the earth and over all its ocean wastes. Yet the German Empire possesses a greater revenue than the American Republic, is the richest nation in productivity, and possesses a population 50 per cent. greater than the United Kingdom. Its actual military power is manifoldly greater than that of the entire Saxon race. Germany is so tightly encircled by the Saxon race that it cannot make even a tentative extension of its territory or political sovereignty over non-Saxon states without endangering the integrity of the Saxon world.

"As it is essential to the future greatness of Germany to destroy Saxon sovereignty and grow great upon its ruins, so it is the first duty of the British nation to arrest or destroy German power. . . . When the convergence of two races reaches the degree of acuteness now existing between the Saxon and the Teuton, it invariably results in war. There is no instance in history where the political relationship of two races approximating that which now exists between the British and German Empires—where one exerts its utmost to prepare for war and the other, by evasion and subterfuge, seeks its postponement—did not result in one of those decisive wars which mark with fatal invariability the end of the unmartial race."

While the present reviewer makes no pretense to being a strategist, he must say that he finds absurd the author's advice that Great Britain should abandon her "silver streak" line of defense and establish herself on the Continent by seizing Holland, Belgium and Denmark.

Very curiously this most militant of militarists was educated in the institution presided over by the apostle of peace and anti-imperialism who writes *The Unseen*

[1] The Day of the Saxon. *By Homer Lea.* New York: Harper & Bros. $1.80.

[2] Unseen Empire. A Study of the Plight of Nations That Do Not Pay Their Debts. *By David Starr Jordan.* Boston: American Unitarian Association. $1.25.

Empire, and in this volume we find the following apposite footnote.

"Among the really sincere creators of war scares, and there are such, 'General' Homer Lea, author of the 'Valor of Ignorance,' stands in a class by himself. Born in Denver in 1876, a sophomore at Stanford University in 1900, a boy with dreams of empire, he spent some time in Canton, becoming a member of some secret society of agitators. 'Undersized and frail, the little General in uniform of his own devising, overburdened by his spreading epaulets, was always a figure of merriment to the scoffers, but the very qualities that dwarfed him in the eyes of his neighbors added to his stature when the uprising in China became an effective reality.' (San Francisco *Chronicle,* May 2, 1912). His title of 'Commander of the Second Army Division, holding the rank of Lieutenant General over these forces' (see 'Who's Who,' 1911, p. 1129), was also 'of his own devising,' the 'forces' so far as known being 'broomstick companies of Chinese in empty squares and vacant lots' about Los Angeles. He was never connected in any way with the United States Army. The 'Valor of Ignorance' is a crude but clever echo of the military philosophy of Napoleon's times, with plans of imaginary campaigns to be executed by Japanese in California. It has no value from the military or political point of view."

Dr. Jordan in his former books, "The Blood of the Nation" and "The Human Harvest," attacked war from the eugenics standpoint. In this he considers a phase of the euthenics of the subject, the impoverishment of the people by the cost of armament. He shows that the new trick of throwing our burdens upon posterity has resulted in loading all civilized nations with debts that they can never expect to pay and in bringing them under the sway of "The Unseen Empire" of finance. It is to the interest of this money power, which holds the world in its fist, that governments should continue to borrow and to spend their money for armament, but not that they should go to war, so Dr. Jordan does not believe that any great war will be allowed, but war scares will occur so long as they are profitable to financiers.

New Books on China

SINCE the Boxer rising in 1900 and the recent successful revolution, China has become a subject of great interest to the outside world. We begin to inquire about what makes that nation last so long, while Egypt, Greece and Rome are no longer in existence; what is the difference between the white and yellow races in morality, religion and social institutions; and what will become of China in the future. A hundred and one questions of that nature rise in our mind, and those who take such an interest in things Chinese will surely welcome the publication of four new books about the Old Empire. Those books are placed together, not because they touch upon the same ground, but because they represent the different activities of new China. Of the four volumes, one is a story of explorations, one an account of a traveler's impressions, one a sketch of the spirit of Chinese philanthropy and the fourth deals with the status of aliens in China.

In Forbidden China[1] is the outcome of fearless exploration, under Viscount D'Ollone, major in the French army, thru the north of Tibet and Mongolia. About these two territories we are beginning to realize that it is not only of interest, but of importance, to know something, on account of the aggressive policy now adopted there by Great Britain and Russia. The book is a slight study of the three groups of people, the Miao-tse in Kwei-chu, the Lolos in Sze-chuan, and the Si-fan in the north of Tibet, including their social system, their peculiar feudal organization, and their civilization. It also tells of formidable mountains, vast snowfields, dangerous precipices, warlike people, Mongol wanderers, cunning lamas, mountain thieves and daring robbers. Aside from all this, the book deals with the discovery of artistic pagodas, pleasure pavilions, grottos, mysterious caves, the richest sculptures of great antiquity, the biggest Buddha, the oldest Chinese castles and the cave-dwellers of Shen-si. The mission traveled from the country of the living Buddha into the center of Islam, and from the coldest desert into scorching valleys. The book contains more adventure than useful information.

The Spirit of Chinese Philanthropy[2] is a book which few could have written, for it requires an intimacy with Chinese classics and literature, combined with a

[1] IN FORBIDDEN CHINA. *By Viscount D'Ollone.* Translated by Bernard Miall. Illustrated. Boston: Small, Maynard & Co. $3.50.

[2] THE SPIRIT OF CHINESE PHILANTHROPY. *By Yu-Yue Tsu, Ph.D.* New York: Columbia University. $1.

good knowledge of sociology. The volume is a careful and informational monograph, which will be of much service to those desiring to study sociological conditions in China. Mr. Tsu tells us that philanthropy is not a new science to the Chinese, inasmuch as China had the old age pension system in full operation as early as 2300 B. C. At present China, the author says, is dotted with almshouses for the shelter of the poor, foundling hospitals, charity institutions and philanthropic associations. Most of those institutions, at the beginning, were private, and then taken over by the people; therefore Chinese philanthropy, the writer believes, has a democratic foundation, and aids in developing the national consciousness and solidarity.

The Status of Aliens in China[3] is a study of the relations between foreigners in China and the Chinese Government. The author was graduated from Columbia University with the Ph. D., and now is the English private secretary to the President of the Chinese Republic. In spite of the fact that the subject is technical, the book has very little of the dryness of international law. The volume is divided into two parts: Part I dealing with the status of aliens during "the preconventional period (A. D. 120-1840)," and Part II with the extraterritorial jurisdiction of foreigners in "the conventional period (since 1842)." The first division of the book comprises the history of the entrance of foreigners into China, their privileges and protection, and of their subjugation to the Chinese criminal jurisdiction, while in the second part are mentioned the origin of the extraterritorial jurisdiction in China, its extent, its limitation, the privileges of foreign merchants in the interior, and of the Christian missionaries. The book is recommended to those who expect to travel or to live in China, for it will give some knowledge of the rights, privileges and immunities accorded to travelers and foreigners.

The New China[4] is an account of "personal and subjective impressions" about China. The author's position as an official Chinese interpreter in the Dutch East Indies afforded him a good opportunity to observe and to study the true character of the Chinese. He has a warm admiration for the people and for China's ancient beauty and wisdom. The book, as is indicated in the sub-title, comprises the author's impressions of Peking, the legation quarter, the forbidden city, the streets of Peking, the yellow temple, the lama temple, the temple of Confucius, the summer palace, and the funeral of the Empress Dowager. The author's style is vivid and animated.

In addition to the four new books upon China there have been two old volumes reprinted. *The Lord of Cathay*[5] is a scholarly research into the Chinese intellectual life by means of association and investigation of the Chinese educational system. The book, tho written a decade ago, is timely still, comprising much original research that none of the other books on China has touched upon. It covers almost every activity of Chinese life, both in its early periods and at the present time, and consequently every one will find it interesting. The poet can find in it the Chinese way of writing poetry, the rhetorician the art of Chinese composition and letter writing, the preacher some material on morality, the missionary some good suggestions for the preaching of the gospel in China, the scholar the development of international law and diplomacy in the Oriental countries, the chemist a history of alchemy of the old Empire, and the theologian, thru the book, can understand the essential difference in the three religions of the East—"the materialism of the Taoist, the idealism of the Buddhist, and the ethical Sadduceeism of the Confucian." Dr. Martin showed without exaggeration how great have been the achievements of China in social reform since her contact with Western civilization, and he defended the good name of the empire without being blind to her many faults.

China in Transformation[6] forms a

[3] THE STATUS OF ALIENS IN CHINA. *By U. K. Wellington Koo.* New York: Columbia University.

[4] THE NEW CHINA. A Traveler's Impressions. *By Henri Borel.* Translated by C. Thieme. With Illustrations. New York: Dodd Mead & Co. $3.50.

[5] THE LORD OF CATHAY. *By Dr. W. A. P. Martin.* New York: Fleming H. Revell Company. $1.50.

[6] CHINA IN TRANSFORMATION. *By Archibald R. Colquhoun.* With Illustrations. New York: Harper & Bros. $1.50.

complement to the above mentioned books, for it contains something about everything Chinese from China's early contact with Western Powers to the establishment of the new republic. It is unwise of the author to use thruout his book the word "Chinaman," which is now considered as offensive and insulting to the Chinese. The book is interesting and instructive, for it deals with the Chinese people, their religions, their government, the native press, the new learning and the geographical question. The author believes that the practice of the principle of self-sacrifice among the natives has been an essential element in the preservation of Chinese social institutions. H. K. Tong.

Concentration and Control: A Solution of the Trust Problem in the United States. By Charles R. Van Hise. Pp. xiii, 288. New York: The Macmillan Co. $2.

In this country there is no problem which presses so urgently for settlement or which has proved so baffling to our legislators as the one which President Van Hise considers here. His views—exprest after a dispassionate survey of the facts—are similar to those which have been adopted by the new Progressive party; he advocates the enactment of laws designed to preserve the advantages of combination in industry while guarding carefully the public interest. The subject is presented systematically, tho not, it must be said, in a very attractive literary form. The first chapter, dealing with the general facts of concentration, attempts to show that competition is breaking down; that if it is the life, it also is the death of trade; and that, in view of the enormous wastes of the system, business men have before them the alternative of failure or combination in defiance of the Sherman act. "They all take their chance, hoping that the blow will fall elsewhere. With general violation and sporadic enforcement of an impracticable law, we cannot hope that our people will gain respect for it." In the same chapter the causes and purposes of concentration, its extent, its form and its advantages are discussed, always with abundance of concrete illustration. While not prepared to express the economic advantages in terms of percentages, the author believes that they are certainly "very great." At the same time "there may be a limit beyond which additional economic advantages may not occur from further increase in magnitude." The chapters which follow discuss the numerous American anti-trust laws, the history and practice of the more prominent combines, and the situation in European countries. "It appears that the premises with which Great Britain and Germany start concerning combination in restraint of trade are just the reverse of our own. Our faith is in competition; their faith is in co-operation." These earlier chapters are preliminary to the proposal of remedies: concentration, co-operation and control. "Thru concentration we may have the economic advantages coming from magnitude of operations. Thru co-operation we may limit the wastes of the competitive system. Thru control by commission we may secure freedom for fair competition, elimination of unfair practices, conservation of natural resources, fair wages, good social conditions and reasonable prices." Remedial legislation should at least recognize the necessity of allowing a limited degree of co-operation and securing equal justice for the strong and the weak. President Van Hise has the great merit of being thoroly practical in discussing his proposals. Unfortunately, having published the book hurriedly, because of its pertinence to the issues of the present campaign, he has allowed numerous errors to pass in reading the proof.

An Outline of the History of Christian Thought Since Kant. By Edward Caldwell Moore. New York: Scribner's Sons. 75 cents.

We are glad to notice that the author of this scholarly little manual promises us another and longer work, of which the present volume may be considered simply as a foretaste. It is not only the many merits of this work, both in aim and in execution, which makes us wish this, but certain deficiencies as well. The book as it stands is practically a series of brief biographical notes of several of the leading modern thinkers and their influence upon the attitude of the Christian Church. Professor Moore is rather liberal in his

interpretation of the term "Christian thought," for he devotes more space to the rationalistic thinkers outside of the various Christian churches than to the intellectual movements within the churches themselves. As a ready reference compendium of nineteenth century philosophy and criticism the book should prove useful in a minister's study; but we fear that its condensed style and lack of unity will not make it popular with the ordinary layman interested in the subjects treated.

The Lighted Way. By E. Phillips Oppenheim. Boston: Little, Brown & Co. $1.25.

In the kind of plot mystery which depends upon unraveling snarled skeins of circumstance, no English novelist has equaled the author of "The Moonstone" and "The Woman in White." But Mr. Oppenheim comes as near to taking the place of Wilkie Collins as any of our contemporaries. Unlike many other authors who depend, like him, upon assassinations and cabals for the interest of their tale, Mr. Oppenheim is not content with the crude thrill of bald facts. He imparts to his material the distinction of style, and he writes admirable dialog which carries forward the action with such swiftness and conviction that the reader forgets the indignities that are heaped upon the ancient ghost of the probable. *The Lighted Way* is typical —a melodrama, which involves a London business house, revolutionary anarchists, a castle in Corsica and a desperate intrigue for the throne of Portugal. Arnold Chetwode, a young man of good family and an employee in the London firm, is the youth about whose experiences the story is unfolded. Without leaving London, he is ultimately able to learn both sides of a series of complex and highly sensational situations. At last, when everything else is settled, Mr. Oppenheim, by an athletic employment of coincidence, rewards Chetwode in arranging his marriage to the niece of an anarchist, who turns out to be the lost daughter of Count Sabatini, who is the aristocratic head of the adventurers seeking the Portuguese throne, and, as it turns out at last, a man of vast wealth and the brother of the wife of Chetwode's London employer. And this is but a suggestion of the complications of the story. The book reads well, and it appeals to that in us which likes to glance back toward Nick Carter as we journey toward the Land of Literature-for-Its-Own-Sake. But Mr. Oppenheim ought not to publish novels so often, for his facility makes him careless.

The Turnstile. By A. E. W. Mason. New York: Charles Scribner's Sons. $1.30.

Some romantic impulse led a young girl of seventeen on an Argentine estancia to send an unsigned cable of good wishes to Captain Rames as he left England in charge of an expedition in search of the Antarctic Pole. Some three years later the two meet in England, Cynthia Daventry and Captain Rames, now an explorer of distinction, seeking a career in politics. The result is a sudden marriage which takes place before they have achieved complete mutual understanding, a marriage in which Cynthia seeks relief from the anxieties of self-protection and Rames a very literal helpmeet for his parliamentary ambitions in his wife's fortune. Nature refuses to be so

MR. E. PHILLIPS OPPENHEIM

readily reconciled, and there is the inevitable awakening, in a series of dramatic situations centering in a mystery surrounding Cynthia's birth, and in an unforeseen and desperate conflict between Rames's political ambitions and an untamed passion for the Antarctic. The novel has more than ordinary narrative interest, if not always completely convincing in working out its motives.

The Borderland. By Robert Halifax. New York: E. P. Dutton & Co. $1.35.

If there is anything more depressing than London streets it is certainly a realistic tale of London streets. *The Borderland* spares us nothing of the grime, filth and obscenity of the midnight streets of Hoxton. Into them the author sends an earnest young man from the "Christian Brotherhood Mission," apparently as defenseless as a child against the dynamic degradation of the people he wishes to help. Frankly, the story seems to us incredible—not the ugliness of the evil so dramatically described, but the fall of the young missionary sworn to purity and helpfulness, and the absence of hard-working, decent people, who indubitably do live in London in a hopeful majority. A man of his type would have married Donna or put her into a safe place with respectable people. All of his training and traditions as well as his love for her would have stood between him and a commonplace intrigue. It is not only immoral, it is false psychology, that persuasion of the inevitability of sin and its value as an education in sympathy. "Without the fall of the hero there would have been no story?" That might have been endured with equanimity, since the story as it stands is untrue. Mr. Halifax says: "This London of ours is like a well-drest man with dirty underclothing," and he religiously proceeds to wash this dirty linen in public, in the pages of an exceedingly clever novel. There are many well differentiated figures picked out as tho by searchlight from the London gloom, and some dramatically pictured scenes; yet, as a whole, the book leaves us a sense of unreality and of mistaken ethics, unpleasant and irritating in consideration of the author's ability.

Literary Notes

....Quaint philosophy and a discussion of river rights make up the little volume entitled *The Bay and the Man,* by Luke Saunders (New York: The Bookery).

....Gustave Masson's abridgement of Guizot's "Larger History" of France, from the earliest times to the outbreak of the Revolution, is announced for publication by Funk & Wagnals ($1.75).

....In *The Master of Evolution* (Boston: Sherman, French & Co.; $1) George H. MacNish outlines a theory of theistic evolution based upon the idea of the development of society under the influence of the opposing forces of heredity and variation.

....*Nature's Truths Told to a Little Maid,* by Margaret Irving (New York: The Bookery), is admirably adapted to its purpose. The secrets of life are revealed in the most delicate and wholesome way by a gradation of lessons of the lower forms of nature.

....The American Tract Society announces a number of interesting publications, among them an account of Palestine by Dr. Cortland Myers, *Where Heaven Touches the Earth,* and Frank E. Channon's *The Stalwarts: How Oxford Students Stood for Protestantism.*

....Governor Geer's volume, *Fifty Years in Oregon* (Neale; $3), is an autobiography. The style is anecdotal and personal in the extreme; but the natural interest of the material is great, and Governor Geer has had a conspicuous part in much that he describes. The book contains 536 pages, but has no table of contents, no chapter headings and no index.

....Useful aids to the appreciation of the scenery of our own country are the series of volumes on northwestern mountains written and published by John H. Williams, Tacoma, Washington. "The Mountain That Was God," devoted to Mt. Tacoma, had a good sale and his new volume, *The Guardians of the Columbia* ($1.50), should prove as popular, as it is profusely illustrated with half tones from exceptional good photographs and eight color plates.

....The Chautauqua books have improved at least in interest since the days when Timayenis's "History of Greece" was inflicted upon the underserving Circles. Even those without the strong sense of duty that distinguishes the C. L. S. C. will enjoy reading the four European books of this year: *Home Life in Germany,* by Mrs. Alfred Sidgwick, an Englishwoman's observations, lively, accurate and tolerant; *Social Progress in Contemporary Eu-*

rope, by F. A. Ogg, a compact account of recent history and present legislation; *Mornings with the Masters of Art,* by H. H. Powers, well illustrated, and *The Spirit of French Letters,* by Mabel S. C. Smith, with many translated quotations (Chautauqua, N. Y.: Chautauqua Press).

....The devotees of Zola, if such there are nowadays, will be pleased at the appearance of *A Zola Dictionary,* by J. G. Patterson (Dutton; $3), for it treats the works of the founder of naturalistic romance with a scientific seriousness that would have been very pleasing to him. This large volume deals with the Rougon-Macquart series, the twenty volumes of which occupied Zola twenty-five years and contain 2,500,000 words, introducing over 1,200 characters. Of these the more important are the descendants of Adelaide Rougon, a degenerate and neurotic family of which Zola deals with thirty-two members, embracing five generations from 1768 to the present time. As a study in eugenics, or rather dysgenics, it rivals the monography on the Jukes and Kallikaks.

....Two of the later issues of the little forty cent handbooks of the Cambridge University Press (Putnams) are *A History of Civilization in Palestine,* by that most competent authority on the subject, Prof. R. V. S. Macalister; and *Ancient Assyria,* by O. H. W. Johns, Master of St. Catherine's College, Cambridge, who is a recognized authority on the subject. The book on Palestine gives a synopsis of its history from the later stone age, thru the Ammonite, Egyptian, early and late Hebrew, Roman, Saracen, Crusading and Turkish periods, down to the late revolution. Credit is given to modern Western influences for education and civilization, altho we fail to find mention of the latest Zionist immigration and culture. The book on Assyria holds strictly to its title, ending with the fall of Nineveh in 606 B. C. It is necessarily more annalistic, but is replete with the facts given on the monuments, including those gathered from the later excavations at the Hittite capital and at the older Assyrian capital.

....Mrs. Charlotte Cameron's *A Woman's Winter in South America* (Small, Maynard) presents us with her full-length portrait as a frontispiece, and the book itself is simply a personal and superficial account of a journey which skirted the coasts of South America, with no visits to the interior, not even to Santiago in Chile, with the exception of the railroad journey from Buenos Aires to Valparaiso. The author writes of Bolivia without having seen the country and of Bogota without having been nearer it than seven hundred miles. Mrs. Cameron visited a poor bull fight in Montevideo; she speaks with enthusiasm of several South American liquors; she writes with good temper and with naive interest in trifling things but with never a thought of the real life of the people or the real problems of their life. The experience of the author shows how easy a thing a trip to South America is and how much can be seen of cities and surface customs without the discomfort of land travel and without having to do more than tranship two or three times from one comfortable steamship to another.

....An unusual cook-book filled with recipes from Greece, Turkey, Sweden, Holland, France, Italy and Spain, ought to be a boon to the perplexed cook who wishes somebody would invent a new meat. Here are, at least, new ways of cooking and serving the old in *Recipes from East and West,* by Euterpe Craies (Routledge; $1). Many of the Oriental dishes are delicious, and Italian cookery, especially of vegetables, is toothsome and worth study by cooks of all degrees of attainment in their art.

....“The Angel of Death has already come and gone for the personality of Oscar Wilde some years since, but it has not, nor can it touch the immortality of his thought or of his soul. These are eternal, joyous off-shootings of the Soul of God. Earthly judgment may praise or censure the man of whom this is written, but it cannot interfere with the judgment of Him who wots of poet's ways even, verily, as His Very Own.”

This is as far as we have got in the “Foreword” and we are going to stop right here and say that any one who wants more of this sort of thing may find it in *A Study of Oscar Wilde,* by Walter Winston Kenilworth (Fenno; 50 cents).

....The life of *Edward Fitzgerald Beale,* written by Stephen Bonsal, is published by Putnam ($2). Few careers, even in America, have been so replete with thrilling adventure and kaleidoscopic change. In his early days, as scout and government mesenger, he was the intimate companion of the famous Kit Carson in many desperate journeys. Later he was the surveyor of the great highways for emigrant travel across the Western plains. He devised and successfully carried out a remarkable experiment in the utilization of camels as a medium of transportation across the “Great American Desert.” Tho the camel failed, however, to become naturalized in America, it was thru no fault of General Beale, or, it would appear, of the camels, but because “the ordinary teamsters and muledrivers were afraid of them.” Under a commission from President Lincoln, Beale was instrumental in saving California for the Union in 1861. In 1876 President Grant made

him minister to Austria, where he remained for only a year, but with notable diplomatic success. Out of fascinating materials Mr. Bonsal has made a most readable book.

....Instead of reviewing the book by Anatole France, which comes to us in translation, *At the Sign of the Reine Pédauque,* let us open a certain volume of essays by M. Gaston Deschamps and read what we find there. The descriptions of the exterior world which we find in the *Reine Pédauque* and elsewhere are, writes this critic, engraved with a fine, fastidious tool, "and often have the appearance of being copied from old prints. His erudite fantasy decorates and arranges all that he sees. He is obsessed by the authors whom he loves; often by those whom he does not love." If we seem to be leaning too heavily upon the book reviewer of the Paris *Temps* instead of having our own say, we can at least offer the excuse that it is only a few weeks since we published a signed article upon Anatole France. In the circumstances, then, what can we do more profitably than quote the very clever M. Deschamps?

"For him [Anatole France] virtue consists in remaining tranquil, in watching his own many-colored reflections of being, and in undergoing, with a nonchalant spirit, the law of perpetual development. . . . Far from the madding crowd, he has sought a retreat propitious to delicate reveries and chosen ecstasies. *In angulo cum libello* is his motto. He might have been the librarian of the Abbey of Thélème; but he is a librarian capable of passion, and it is not only in his dear library that he finds loved corners. He does not lead the life of a recluse. He is quite willing to quit the black-and-white pages, where the men of old have fixed the image of what they saw."

As for his philosophy and religion:

"If ever M. Anatole France runs the risk of martyrdom, it will be to confer the doctrine of the relativity of understanding, to affirm the nothingness of human opinions, and to attest, at the price of his blood, that there is no truth."

Needless to add that this skeptic is an individualist—in spite of his flirtations with Socialism. "I have not the courage to regret that he has so long studied his *ego* and that he has so gracefully unveiled before us what he has discovered in that microcosmos," confesses his critic. Epicurus is his master, but not the Epicurus of Lucretius; rather "a new Epicurus, very modern; indulgent to the recent fashions; initiated, without fervor, in the mysteries of contemporary science; an Epicurus listened to in the literary salons and in the thick of his century: nowise disposed, like the moralists of yore, to retire into a forest, far from men. . . . In brief, the talent of M. Anatole France touches all things with thoroly irreverent delicacy." M. Deschamps wrote these words of the author of *At the Sign of the Reine Pédauque* nineteen years ago, when M. France was little known outside his own country. We cannot improve upon his observations, and need only add that the translation is well done, and the volume an exceedingly handsome one physically (John Lane Co.; $1.75).

Pebbles

PASSENGER.—Can I get a late train to Sleepyhurst?

Trainman.—Sure. Take any of 'em.—*New York World.*

FAIR ONE.—I think all men are flirts.

He.—Oh, you shouldn't say that.

Fair One.—Well, perhaps you're not. But it seems to me all the nice ones are.—*New York World.*

THERE was a young lady whose dream
Was to feed a black cat on whipt cream,
But the cat with a bound
Spilt the milk on the ground,
So she fed a whipt cat on black cream.

"IF you want to put that song over you must sing louder."

"I'm singing as loud as I can. What more can I do?"

"Be more enthusiastic. Open your mouth and throw yourself into it."—*New York American.*

"LOOK here, waiter; how long am I going to have to wait for that half portion of duck I ordered?"

"'Till somebody orders the other half. We can't go out and kill half a duck."—*New York American.*

"THAT was very clever."

"Oh, no, it wasn't Harry's remark that was clever, but I thought his father's reply was rather interesting. He bent down and kissed the dear little fellow and said: 'I couldn't help it, dear. I was stopped in the street by a donkey and couldn't get past him in time to catch my train.' I've been wondering ever since what Jack could have meant."

"Very curious; I met him when he was on his way home last night and stopped and talked to him for quite a while, but he didn't say anything to me about a donkey."—*Chicago Record-Herald.*

RUBAIYAT OF A SUFFRAGET.

Of course I think we ought to vote—don't you?
We women need the ballot, that is true.
We'd decorate the booths with flags and palms,
And we could get up voting parties, too.

But still I think I'd rather go to shows
Than stupid meetings where discussion flows.
I'll ask George what he thinks about the thing.
He knows about it all—he knows—he knows!

I've found that George just hates a suffraget.
He says, by Jove, he never saw one yet
Halfway good looking, or with any style,
And that a woman's sphere's the home, you bet!

And then he said, if I'd give up the thing
He'd just get me the swellest diamond ring.
I think his arguments are simply fine,
And I'm opposed to woman's balloting.

—*Walter G. Doty, in Puck.*

The Independent

Entered at New York Post Office as Second Class Matter
Publisher, Clarence W. Bowen
130 Fulton Street - - - - New York

A WEEKLY MAGAZINE FOUNDED IN 1848
One Year, $3.00 Single Copies, 10 Cents

Single copies over six months old, 25 cents. Postage to any foreign country in the Universal Postal Union, $1.75 a year extra; to Canada, $1.00 extra. Subscriptions will be received for other periodicals, and clubbing rates will be granted as low as those offered by any responsible agency.

An order for the change of an address should be received two weeks before the change is to take effect. The old as well as the new address should be given.

For the convenience of our subscribers we will send on receipt of the publisher's price any book reviewed or advertised in our columns.

Volumes of The Independent are completed at the end of December and June, and a full index is furnished free on application. Neat binders holding in book form thirteen current issues will be furnished for 45 cents.

If the numbers comprising any semi-annual volume are returned to us prepaid in good condition with $1.50 we will bind the volume in handsome and substantial half buckram and deliver it free anywhere in the United States.

We are always glad to receive articles for examination, but writers desiring the return of their manuscripts, if not accepted, should send a stamped and addressed envelope. Even so, we cannot hold ourselves responsible for their return. Authors should preserve copies of their manuscripts.

Advertising rates will be furnished on application.

A Stable Dollar

MANY elements enter into the cost of living, but always the great and dominating factor is price. You may live simply or elaborately; your income may be large or small; but whether you buy much or little, and whether you have much or little to buy with, market prices will largely determine how much of the things that you look upon as worth while you shall get for all your efforts of mind and muscle.

Many elements enter into price, but always the great and dominant element is the scarcity or abundance of that metal which is adopted by the more powerful civilized nations as a standard of value and coined into money. Prices are affected by the rapidity with which money circulates. They are affected by the use of supplementary devices, such as bank checks. They are affected by faith, hope and charity in the realms of speculation and enterprise; but mastering all of these factors of price are the actual amount of gold coin and bullion in sight, and the annual output of the mines.

There is no domain in which those happy persons who never can see the forest for the trees are more completely at home—as they suppose—than the realm of practical economics. Every great philosopher among them (that is to say, each and every one of them) has his own "only true and illuminating" explanation of our economic tribulations. The tariff, the trusts, the magnates, the railroads, the milliners, the dressmakers and the suffragets all come in for a share of evil responsibility in the confident explanations of these home-made political economists.

The big facts which they never see, however, are, first, that the advance of prices is a world-wide and not a merely national phenomenon; and, second, that thruout the centuries for which we have records of such occurrences, a world-wide change in the level of prices has followed every important increase or decrease in the production of bullion. Not to go back beyond the memory of men still living, the gold discoveries between 1849 and 1860 produced an immediate, great and world-wide increase of commodity prices. The check to the production of gold in the seventies and eighties was followed in like manner by an immediate, great and world-wide fall in commodity prices. And now, once more, since the gold discoveries in Colorado, South Africa and Alaska, commodity prices thruout the world have soared and are still soaring.

All this to the student of economics is trite and elementary. To the great majority of intelligent business men also it is reasonably familiar. Accepting this view of the facts, not a few business men and trained economists with almost no exceptions have long since mastered the theoretical problem of an ideal stability of prices. If we could have a monetary unit as unchanging in value as our units of weight and of length are unchanging in extension and "pull," the level of prices would change but imperceptibly, and the monetary unit would not change in *value* if it could automatically change in *weight* with every change in the production of bullion.

Many suggestions have been made in this and in other countries, but no one of them has seemed to be entirely practi-

cable. The basis of all the scientific ones is the "index number," that is to say, a certain average of current prices. The index number shows how much prices have advanced or fallen within a given period. If the amount of gold in a dollar, a sovereign, or a twenty franc piece could automatically be increased or decreased with every fall or rise of the general price level, the fall or rise would stop as mechanically as the speed of the steam engine piston decreases or increases with the action of the automatic "cut-off."

So far as our knowledge goes, Professor Irving Fisher, of Yale University, is the first man to discover an absolutely simple and feasible way to achieve such a regulation of the purchasing power of the money unit. In the article by Professor Fisher which we publish this week his proposed method is clearly explained. In former times governments usually exacted a "rake off" when they coined bullion into money. The percentage deducted was called "seigniorage." The United States does not exact seigniorage. Professor Fisher's proposition is simply that seigniorage shall be taken, and that it shall automatically vary in amount with any tendency of prices to rise or fall, as shown by the index number. If to the uninitiated this sounds a bit technical, the idea may be exprest in another way by saying that the United States Government, if Professor Fisher's plan were adopted, would buy more or less of gold bullion with a gold dollar (which would itself remain of uniform weight) according as gold bullion, being more or less abundant, should exchange for more or less of other things. The purchasing power of the gold dollar would then remain always the same.

The right way to do a thing, when it is discovered, usually proves to be so simple and obvious that everybody says: "Why wasn't it thought of before?" We believe that Professor Fisher's proposition in due time will receive serious attention, not only from economists, but also from business men and governments. Without venturing to anticipate the verdict of qualified experts, we have no hesitation in saying that it appears to be both scientific and feasible.

The Legal Shortening of Life

THE question of mercifully putting human sufferers for whom there is no hope of relief and whose disease has been pronounced incurable out of their misery by some painless form of death has often been discussed. It has received renewed attention during the past few weeks from the appeal of a young woman to the press of New York City, that those interested in humanity might secure the passage of a law that would permit the painless shortening of existence for herself and other sufferers like her. She has been some three years unable to move, suffering pain as she says constantly, tho her vigorous protest and the many interviews that she accorded to reporters who saw no special sign of suffering does not exactly support that contention. She insisted when an animal is known to be suffering from an incurable disease or has been injured in such a way that ultimate hope of recovery is out of the question, we mercifully put it out of existence and call our action humanitarian. Why should we not do at least as much for human beings? They are almost infinitely more capable of suffering and their power of anticipating what is to come and of recalling what they have passed thru doubles the suffering of the moment and makes it ever so much harder to bear. Perhaps the question has settled down from its sensational stage into the deliberative phase where it may now be discussed seriously.

The patient in question is a young woman and has all the impatience of youth when there is question of prolonged suffering. During the days following her declaration there appeared a series of communications in the newspapers from persons who have been many years suffering from ailments that confine them to their bed, or at least to their room, and who have no hope of ever being well enough to get out for ordinary occupations, yet who insist that they find life well worth living, have much to occupy themselves with, and that the sympathy of friends and their own power to sympathize with others leaves them without any desire for the shortening of existence. Indeed, physicians are pretty well agreed that the in-

curably ailing are not those who complain most and who are readiest to talk about ending life. Most of those who commit suicide every year are suffering from minor ailments, if suffering physically at all, and suicides are usually persons who have become discouraged over some difficulty in life that others have met successfully and without exaggerated discouragement. Indeed, the conclusion to which many physicians have come as the result of experience is, that the louder the complaints, except in certain acute cases, the less the real pain. Their most complaining patients are the hysterical who are engaged in exaggerating some comparatively trivial sensation of discomfort into unbearable torment.

As regards the question on the legal shortening of existence, the more physicians know about disease and about humanity the less are they likely to think seriously of any such remedy for human ills. The most difficult problem that any physician has is the prognosis of disease. Unfavorable prognoses are often rudely contradicted by the recovery of the patient and life for many years. There are a number of patients, especially in our dispensaries, who seem to be rather proud of the fact that they have outlived a number of physicians who gave a very unfavorable report as to their cases and said that they had not long to live. In every form of disease, in tuberculosis particularly, this contradiction of even the prognosis of expert physicians may occur. The three specialists in tuberculosis who have done most for us in this country in the study of the disease were given up as young men, yet have lived for from twenty to forty years since and have accomplished an immense amount of good work. Even cancer sometimes agreeably disappoints the judgment of the physician, and spontaneous cures when the new growth seems to be surely hastening toward a fatal termination are not at all infrequent. Even in acute disease, peritonitis, septicemia, complications after injuries and the like, there are often recoveries when all hope seemed to be out of the question.

As the result of this experience, physicians, and especially those of long years of practice, would be almost the last in the world to ask to have imposed on them the burden of deciding whether there was any hope in a particular case or not. As a rule, physicians do not see many cases in which there is real desire for shortening of life, tho at times of acute pain patients may murmur and may talk of how much better it would be if they should be taken. There often come to such patients moments of cheer and joy that make all the sufferings they have past thru seem worth while. Indeed, there are many patients bed-fast and without any hope of ever getting around, and besides with intervals of severe pain, who yet prove to be cheerful consolers for others, fine examples of magnanimity, that make the little trials of life that others have to suffer seem indeed trifles, and who are very helpful to those around them. The chronic invalid is indeed often a blessing in the household, lifting others up, deepening human sympathies and becoming themselves models of patience that are fine exemplars for humanity.

The mystery of suffering remains a mystery, yet some of it is solved for us in the good effect upon human nature of suffering for itself, or contact with the sufferings of others. It was an American humorist who said that life was a dangerous thing at best and very few of us get out of it alive. None of us get out of it without suffering, and the exemplary patience of the chronic sufferers makes life ever so much easier for many of those around them. Impatient youth may refuse to bear the burden, but in old age there comes the feeling that absence of pain is almost positive pleasure.

Deep feeling is always pleasurable, and the joy of relief often seems to sufferers to be sufficient gratification to make the suffering worth while. Laughing gaiety is not the essence of happiness in life, but on the contrary, as has often been noted whenever human nature feels deeply happy, there are likely to be tears in the eyes. Mothers whose sons rejoice their hearts by some success in college or in life, or whose daughters marry well and happily, are almost sure to have tears in their eyes when such events are celebrated. Deep feeling is close to the fountain of tears, and human suffering as an exercise of some of the best func-

tions of humanity is not without a fine satisfaction. It has often been pointed out that nearly all pleasure is associated more or less inevitably with some pain. The physical exercise that so many people rush into now brings with it much more than tiredness, especially at the beginning. Achy feelings and positive pain even are experienced, yet it is persisted in with satisfaction. It is the mental attitude that must be changed, and not humanity's mode of dealing with suffering humanity in such cases. We do not need a new law legalizing euthanasia, for all death bravely faced is euthanasic.

Germany and Big Business

SUPPOSE President Taft should attend in state a birthday celebration of John D. Rockefeller, and in an after-dinner speech congratulate him on the service he had done America and the world in founding the Standard Oil Company and in selling the Chinese glass lamps at less than cost in order to get a chance to fill them. Or suppose the President should participate in the exercises commemorating the establishment of the United States Steel Corporation and allude to Elbert H. Gary as his partner in the god-given task of empire building, because he had not only armed the battleships of the nation, but had aided its conquest of the world's commerce by selling steel rails cheaper abroad than at home. If Mr. Taft were to do this what would be said of him? Would not his friends call it "a grave mistake" and would not his enemies say worse things about him than they do now, assuming that the vocabulary of the language allows of it?

Yet Kaiser Wilhelm visited Essen on the occasion of the centenary of the Krupp Steel Works and in his speeches laid emphasis upon the fact that the marvelous industrial development and commercial expansion of Germany were due to the co-operation of government and industry to that end. Now the Krupp establishment, whatever else we may think of it, is a great triumph of German science and skill. Even a socialist like Bernard Shaw cannot withhold a tribute of admiration, for he manifestly took Krupp as the model for Undershaft the Armorer in "Major Barbara." The Krupp works now employ 70,000 men and have transformed Essen from a miserable dirty town to a model city of 300,000 inhabitants. Incidentally the works pay the owner, Bertha Krupp, some $8,000,000 a year, doubtless too much for any girl to have, but it does not seem to have spoilt her. She can handle a needle as well as a forty-foot gun, and when she married a few years ago she made the whole of the trousseau herself. The pension and insurance system devised by Alfred Krupp for his own employees was adopted by Bismarck, and is now universal and compulsory thruout the empire. This is only one of many instances where the Krupps and the Kaisers worked hand in hand to the advantage of the country.

It is funny to see how Germany violates the laws of political economy with impunity, nay even with prosperity. What in this country is regarded as improper and to be done, if at all, on the sly, is in Germany done openly and as a matter of good policy. If it leaks out that American typewriters or reapers are being sold in England cheaper than here it is held up as a proof that the tariff in this case ought to be removed or lowered. But a German manufacturer goes to the Government and says: "If you will put a duty on this we will sell it in England so much cheaper than in Germany," and if the Government finds it can be done up goes the tariff. Great Britain was forced to abandon her free trade principles in the matter of sugar because the German Government paid so high a bounty on beet sugar that it knocked out the cane sugar grown cheaper in the British West Indies.

We Americans believe it is necessary to have free competition, especially in the case of limited natural resources, such as petroleum. The Germans go on the opposite principle, and believing that free competition is injurious, they encourage combination. When the potash producers of Stassfurt had a falling out and began to cut prices on the salts—an indispensible fertilizer, of which this is the only extensive deposit—the Government

stept in and made them form a new combine and put up prices, even interfered with our taking advantage of the contracts we had obtained during the cut rates period by clapping on an export duty.

In China, in Asia Minor, in Morocco, everywhere, the German bayonet is being used as a jimmy to pry open business opportunities for German merchants. This is "dollar diplomacy," if you please, but somehow it seems to pay. The state trains for the foreign commercial as well as military service. The German ships are all warships if need be. The story is told that an agent of the German Government visited a leading manufacturer to inquire why he had put in no bid on a certain international competition for supplies. "We cannot," answered the manufacturer, "because we have a Government contract on our hands that will occupy all our force for some time." "Go after the foreign job and get it," said the agent. "We will hold the Government contract for you."

On account of these and similar tactics, or perhaps we should say in spite of them, the German exports in the last five years have increased $405,000,000, an increase greater than that of England, $390,000,000. In the same period Great Britain has increased her imports by $365,000,000 and Germany but $275,000,000. Or to consider only these two rival countries, Great Britain buys $119,000,000 more annually from Germany than five years ago, while she sells to Germany only $16,500,000 more.

But, as we have said, this is shocking and quite unaccountable. It is contrary to the laws of *laissez-faire* as we were taught them in school. It is contrary to our American method of harassing big business if we cannot stop it or control it. The German commercial system is as repugnant to our economic principles as their monarchy and militarism are to our democratic principles. But as we watch Germany we Americans must feel something like the good little boy, who minds his mother, when he sees other boys eating green apples, going barefoot in the wet, hanging by the toes from the limbs of trees and fishing on Sunday without any of the things happening to them that should happen.

Governor Blease of South Carolina

THE primary nomination for Governor has stirred up a lot of trouble in South Carolina. Was it an honest vote? Could it be honest, when such an unparalleled jump was made in the number of voters? Never before has the vote cast in a South Carolina primary reached 107,000; the vote the other day was greater by about 34,000, an increase of over 31 per cent. The figures are suspicious. It is not clear who profited by it, for Governor Blease's majority over all of less than 3,000 implies that his principal rival had an abnormal vote, unless the frauds in favor of Governor Blease were enormous. An investigation is promised which may show whether one of the ancient States really desires so undesirable a Chief Magistrate.

We may illustrate the character of Governor Blease by recalling an address of his of a few months ago, and contrasting it with another address by a saner man. Governor Blease was addressing the Confederate veterans of his State in the same week in which President Taft spoke to the Union veterans at Rochester, N. Y. Governor Blease harked back to the war, severely denounced Senator Heyburn for not having given the lie to one who spoke disrespectfully of the cause of the Confederacy, and told his hearers that General Sherman was "an infamous scoundrel." Thus he tried to please his hearers and advance his own political prospects. President Taft, on the other hand, simply gave honor to his brave veterans, but called their attention away from the ancient feud, and bade them consider the coming victories of peace.

Who burnt Charleston? Was it General Sherman, as Governor Blease told the veterans, or was it the Confederate authorities, to prevent the city falling into the hands of the Union soldiers? We do not care to decide, altho Governor Blease mounted his Rosinante and tilted lustily against a school book. He declared that if a history book is allowed in the schools of the State that inaugurated secession it must settle the question, and declared that it was General Sherman who burnt the city, the "infamous scoundrel" that he was. Who burnt Moscow?

We don't believe it was the French soldiers, and it was a noble thing to do; but Governor Blease would not allow that such a self-sacrificing spirit was possible in his own State. The book attacked gave no judgment about it; the author did not want to give offense on either side; but the Governor was not willing to have peace and let bygones be bygones. He would keep up the war when the war is ended all over the rest of the country. More than half the country honors General Sherman. It does not believe that he gave orders to burn Charleston, and that if it was set on fire by Union soldiers they were of the advance of the army and acted without orders. We do not claim to know or care who did it. We want harmony between the North and South. The country has no use for fire-eaters. Governor Blease is no credit to his State. His defense of his tilt against the school book was made to a meeting of the Confederate veterans. Such a meeting of the old soldiers on either side is worthy and proper. But it should not be made the occasion to abuse the brave soldiers on the other side. Let the old soldiers glory in their brave fight, but it is to be regretted if their children maintain their organization, as is done in some sections, and if the speakers who were not soldiers take pains to rekindle the old fire.

President Taft took a better way. His address was devoted wholly to peace. And why should not an address to old soldiers talk of peace? Who know the value of peace so well as do those who have seen the evils of war? Did not General Sherman say that "War is hell"? Accordingly, our President spoke of the struggle more prolonged than that which ended slavery, between wealth and labor, and assured his listeners that at last a happy settlement would be reached, but without any such expense of blood. Then he turned to the arbitration treaties and the amendment proposed in the Senate, still talking peace and still looking at the present and to the future, and wisely avoiding the issues of the past that might stir up some old rancor. He accepted to the fullest and with all loyalty the constitutional authority of the Senate in the making of treaties, but he showed that in those drawn up with Great Britain and France the Senate's rights were preserved. Already the Senate has approved dozens of treaties which involve other questions besides those of honor and territorial boundaries, thus allowing the principle involved in all questions of dispute whatever. He then showed that the question of repudiated State bonds could not come up, because the treaties confined arbitration to differences that might arise in the future and did not apply to those of the past; and he further showed how the Monroe Doctrine could not be involved. So he talked peace, peace, to men of war who loved peace better than war; and he bade them have their eyes on present duties and not hark back to the old quarrels. So in THE INDEPENDENT of last week he reverted to his favorite topic.

Which is the better way, that of President Taft or that of Governor Blease?

A New Angel of Peace

IT has long been suggested, and it has been hoped by some, that war might eventually become so deadly that it must come to an end. Inventors of more destructive weapons or explosives have claimed to be the friends of peace, because the use of their enginery would be so destructive that no nation could endure to go to war. Thus far these happy prophecies have failed to come true; but now we would appear to have reached a stage in military science in which militarism is in danger of destroying itself.

The war games just concluded in France and England have given very startling results. Those in England were suddenly concluded because of unexpected difficulties. We are not told what they were, but it is reported that it was found impossible to make any surprises or in any way to deceive the enemy and gain an advantage, because the daring aviators could watch and report every movement of the enemy. Flying about as they do, dozens or scores of them, and at a speed of 60 miles an hour, it is impossible to shoot them. The general on either side knows exactly where his enemy is and watches every movement of feint or attack. Movement behind a hill or forest is seen as if on the open plain. They cannot hide out of sight where the hos-

tile mortars cannot be raised at the proper angle to reach them. There will be nothing left for an army to do but to march straight forward into the enemy's fire and to be mown down by its artillery before meeting with the bayonet.

What the airship can do appears in the late flight of a dirigible attached to the German army, which sailed over Copenhagen, carrying a dozen military passengers. There it halted, but was forbidden to pass over the Danish forts on its return, or over the British visiting warships, and two Danish officers were taken on board to see to it that the orders were obeyed. In time of war there would be no such prohibition. What an advantage it would have been to General Nogi at Port Arthur if he could have thus seen every movement within the fortress and known where to direct his attack.

Then think what airships and aeroplanes might themselves do besides scouting. They might be terrible engines of war. They could drop the most destructive bombs on the deck of a mighty dreadnought and annihilate it in a moment. There may be a new law of nations forbidding this, but we may be sure that a weaker power would not fail to use every weapon against a stronger one, for the airship equalizes the weak and the strong. The Italians declare that they did not drop bombs down on Arab troops in Tripoli, but the report persists that they did; and why not? Airships are far cheaper than even small water craft, and a small nation can have them by the hundreds, just as France, while massing her fleet in the Mediterranean, is multiplying her birds of war like swallows of summer. The chief of the flying corps of the French army says that warfare has already been revolutionized by the aeroplane; that every act of the enemy was known in the late maneuvers, and that strategy is no longer possible. Another high official says that France will have thousands of aeroplanes, and that if Germany does the same war will become impossible, the consummation which civilization most desires. Then arbitration will be compulsory.

The only avoidance of this mercy will be by the agreement of the nations not to use aeroplanes, or else to limit their use strictly. But what weaker nation will submit to such a rule laid down by the stronger nations? One other resource for the devil and all his war-lords can be imagined, transferring the battle to the skies, the sort of conflict that Milton describes when the spirits perverse made war.

> "Sometimes on firm ground
> A standing fight, then soaring on main wing,
> Tormented all the air; all air seemed then
> Conflicting fire."

Then we should see again:

> "War in the troubled sky and armies rush
> To battle in the clouds."

But we do not expect to see such war in heaven. It would be too terrible. Every new advance in the powers of destruction hastens the day when we shall have surcease of war. Thus is man's wrath made to praise God. The aeroplane shall be the angel of peace:

> "Ne ever let the name of warre be spoken,
> But joyous peace and quietnesse alway,
> Dealing just judgements that mote not be broken,
> For any brybes, or threats of any to be wroken."

The Chinese Loan

THE old East India Company, given a monopoly of trade in China by the British Government, and smashing every competitor that came into its path, has passed away; but another East India Company, in the person of the six-Power group, also with semi-governmental backing and a financial monopoly, comes into existence. The six-Power group, composed of Great Britain, France, Germany, America, Japan and Russia, was prepared to make a loan of $300,000,000 to China with the provision of foreign supervision of the expenditures of the fund, and did not want other financial groups to supply China with money, when the offer was rejected. But according to the *National Review,* the rumor that China refused the loan because of the foreign control of the finances is not true. China has accepted the restricting provision, but "what China will not accept is the introduction of political considerations into what is a financial deal." That China has ground for apprehension is justified by Russia's opposition to the loan in the early part of the year, her disapproval of the use

of borrowed money for the purchase of armaments, Germany's demand to supervise the collection of the salt duties, and Japan's attempt to supervise the reorganization of the Chinese army. England, France and the United States do not seem to have any political ambitions, and China finds no fault with them.

Judging from the past dealing of the financial group, we cannot reproach China for her suspicion and hesitation. About a year ago the banking houses representing Great Britain, France, Germany and the United States were prepared to lend China $50,000,000 on the security of Manchurian revenue, and asked only for the appointment of a foreign financial adviser. Later on, the four-Power group decided to take into partnership Japan and Russia. Following this, a secret conference was held in Paris, and as a result the six-Power group proposed to lend China $300,000,000, of which $250,000,000 was to be advanced immediately. This time it was stipulated that the bankers were to supervise the expenditure of the loan. The agreement further provided that 80 per cent. of the fund should be used for "cultural development" and 20 per cent. for armaments. The expenditure of $60,000,000 on armaments alarmed Russia, and so the Czar refused to join the scheme until the other Powers prevailed upon him to do so. Just at that time a Belgian syndicate proposed a loan of $50,000,000 to China with an immediate advance. This competition caused the sextuple group to lend China $20,000,000, in the hope that the young republic would decline the Belgian loan, which it did. After thus eliminating its competitor, the six-Power group began to play for time, and insisted upon China's accepting the $300,000,000 loan with the restricting provision; otherwise it would not let any financial groups provide money for China.

Sir Edward Grey, however, stated that the group is not anxious to make a loan to China, but China is anxious to borrow money. It is true that China is in urgent need of money. But if the sextuple group is not anxious to make a loan to China, then why does it resent any other group handling Chinese finance by refusing credits to its rivals? Why does not the group give a free hand to the United States "dollar loan for Hankow" or the Cottu's loan? Why was the group alarmed when the preliminary agreement to the Lloyd's loan of $50,000,000 was recently signed in London?

The financial monopoly directly leads to "dollar diplomacy." The Powers refuse to recognize the Chinese republic until their bankers have gained their ends and imposed their loan upon China. Notwithstanding the fact that the Chinese republic has been in existence for the last nine months, and there is peace thruout the whole country, she has not yet been recognized. If the Powers do not welcome China as a sister republic, when are they going to do so? After the signing of the $300,000,000 loan?

The loan may never be made. Other powerful financial groups will rise and champion China's cause. The signing of the Lloyd's loan by the Chinese Minister and C. Birch Crisp & Co. in London is a good indication of this. It is recently reported that the Chinese Government has informed the six-Power group that unless the latter, by September 24, advances $900,000 to meet payments due on the 25th, China will be obliged to accept the installment of the Crisp's loan, which demand the six-Power group would likely reject. Furthermore, it is reported that the conditions in China are improving every day. The provinces are again beginning the regular remittance of revenue to the central Government, and the army is paid off. There is also an immense increase in the customs collections and in contributions from the people. Thus China's need for foreign capital is decreasing every day. The Government, which was able to subscribe a quarter of the capital recently for the new Chinese State Bank in Peking, is not quite so prest for money as we are told by the newspapers. The Peking correspondent of the *Times* said that the total amount of China's financial need to the end of November is some $30,000,000. Surely that comparatively small sum can be obtained without concessions that impair China's independence of foreign control and freedom to manage her own internal affairs.

Collective Responsibility

After a struggle in which every step was shamelessly and stubbornly contested by greed, Congress was induced, a short time ago, to prohibit both the manufacture and the sale of the phosphorus matches which were responsible for the horrible disease of match workers, called "phossy jaw." Within the past year eight States have enacted a bill prepared by the Association for Labor Legislation, requiring the compulsory reporting of certain of the more serious industrial diseases. How large a factor in modern misery these diseases are is shown by a few figures set forth in the report of the Second National Conference on Industrial Diseases. For example, within three years 578 cases of lead poisoning have been reported in Illinois. Of these, 73 cases occurred in one establishment in one month thru the dry sandpapering of lead paint, altho the use of a simple respirator, which had been tested, would have been a perfect protection. During the construction of the Pennsylvania East River tunnels, 3,692 cases of "caisson disease" came under the observation of one physician.

As in most other legislation pertaining to industrial relations, European states are ahead of our own commonwealths in their enactments on industrial or occupational diseases. Such enactments are one expression of a growing acknowledgment thruout the civilized world of collective responsibility. Other expressions of it are old age pensions and workingmen's insurance or accident compensation systems.

This modern collective responsibility, in its practical aspects, is a curiously different thing from that collective responsibility of former ages which was the subject of one of John Fiske's most brilliant and illuminating essays. The earlier group responsibility had its origin in the notion that supernatural power would hold the entire community to accountability for sacrilege or unbelief, and might be expected to punish the impiety of an individual by the famine, pestilence or war that would decimate a people. Back of this notion lay the structure of tribal society, in which clansmen were bound to redress one another's injuries and collectively to make compensation for one another's misdeeds. The ancient collective responsibility led men to inflict the cruelties of religious persecution upon the heretic. Its dramatic manifestations were inquisitions and torture chambers. Modern collective responsibility acknowledges an obligation to diminish human suffering and attempts to prevent it.

The psychological antecedents, however, are not altogether different. For, in the man of the twentieth century, cooperating with humanitarian sentiment is a large element of fear. It is not a fear of divine wrath, to be sure, but a lively fear of those social calamities which formerly divine wrath was expected to inflict upon a wicked nation. A degenerating working population weakens a nation's defenses and impairs its competitive strength in the economic struggle.

The recognition of collective responsibility is an important beginning of those higher processes of social evolution which are imperative if the general welfare is to be maintained under the conditions imposed by increasing population, multiplying activities, and a rapidly increasing complexity of modern life. But it is only a beginning. Between collective responsibility and collective efficiency there is an interval which will not be crossed without great effort, costly experimentation and much discouraging failure. In the attainment of collective efficiency European municipalities have much to teach the too self-satisfied Americans. For example, while we are spending our breath in complaining of the high cost of living and denouncing the trusts and the middlemen, the city of Glasgow, with its municipal slaughter houses and markets, has brought the price of American meats to the Glasgow consumer down to two-thirds of what the American consumer has to pay, and other things in proportion.

Collective responsibility and collective efficiency are two of the realities in which we must look for the further amelioration of the human lot. Individualism and socialism may fascinate the theorist or irritate the philistine. Collective responsibility and collective efficiency are experimental and practical facts.

In the Orchard

WALKING in the orchard, where it slopes over the knolls, toward the Kirkland Valley, as the sun rises red on the other side of the valley—that is a poem. We are startled by the profundity of Nature's gifts; for apples, red as the lips of Hebe, fill every hollow, and are even now rolling into the ditches to fill them more than full. The twisting brook, that comes down with a frisky dash out of the hills, gets a dozen dams before it gets into the free meadow below.

We stand with hat off, under a big winesap, and the apples that fall from this tree alone are about one to a minute. There are one hundred and fifty trees in the orchard, and some of them are already overripe. Look up, and you see no decrease of the stock that is still holding the limbs down, as if offering them to you. Spitzenbergs! Oh, the glory of the crimson harvest! Spys! Every one asking to be eaten! What shall one do about it? There can be little satisfaction in eating to our utmost capacity. Nature surely did not mean this royalty for us alone.

And the people who should have them, where are they? Packed into cities, and paying half a day's wage for a few pockets full of this that is going to waste. Here is the problem, How can we carry the eaters to the food, and not carry food to the eaters? All or civilization is based on the false principle, that compels us to gather all that Nature provides, hamper or crate it all, and then at great expense and thru a half-dozen middlemen, get it to the eaters. Bob White over there has a better system. He brings his family into the orchard, and they thrive on the bugs and beetles that spoil the apples.

The sun moves the shadows about, to create a moving picture show. Oh, ye fools and blind! Paying hard earned coin for pictures not half as rich as you may own yourselves, and pay nothing for the exhibition. Cultivate yourselves to see and to hear. That was common sense, when the Master said, "He that hath ears to hear let him hear." There are superfluous ears that everywhere need training; but our schools are too busy with teaching what one cannot use.

Yet the editor confesses he does not himself hear, understanding only a tithe of the orchard music that ripples around him. A scarlet tanager has a nest just overhead, and his brilliant majesty watches us with a bit of doubt; only a catbird a little down the row, with his nest in a bush, sings out a welcome roundelay, God bless him. A robin's nest is set heedlessly on a broken limb, and the mother is now feeding her babes. It is just the place where a squirrel could find her or a crow select his dinner.

Drop, drop, drop. Grimes's Golden is accumulating a heap in one of the pretty hollows, and we have come upon Maiden's Blush, where the land slopes least, and where the whole lawn is carpeted, every one with red cheeks. Select now the finest to eat, and at the same time fill your pockets. We will go down by the brook, pull off our shoes, and, sitting on that flat sandstone, we will let the minnows play with our toes while we toss them bits of apple.

October is a short month, and it hurries things marvelously. Already it is time to pick winter apples. The ladders are here, and as for these drops the boys have come with wagon and baskets to gather them for cider. That is it; every one of these rolling beauties must be ground and squeezed, and nothing in the world can be finer than the clean honest cider. It is not the stuff that you buy, half water, and flavored with vinegar and other acids. And then the limbs will be stripped of their joyous burden. Walter Pease and Stayman's Winesap, and that most wonderful of all apples, McIntosh Red, will be barreled or boxed, and carted away for market or cellar. There will be nothing left but leaves, and they will fill the brooks. The limbs will be bared to meet the winter blasts. The birds will be gone to Florida. Snow will cover the grass. The orchard is no longer a banqueting room. It is enough. It is all right. It is at all seasons a marvel. The orchard is the noblest gift of Nature to man.

It is not the apple alone that gratifies, but the trees, with their big-armed welcome, and the history of every fruit, and their travels while coming to us, and their family relations, and their social possibilities, their influence upon human

evolution, all this crowds upon us as we wander thru the shade and sunshine. And as for October it would seriously be uncrowned without the apple. Can you imagine yourself for the first time walking thru an orchard, and for the first time picking a great Northern Spy, with at least nineteen hundred years of evolution in its juices? Take off your hat as you move down the aisles toward the sun. Let love and gratitude weave together a song in your heart.

Self-Starvation

We have had experience in this country of the policy of freeing a prisoner condemned for a long term of years because he is likely to die. It is a kindly impulse which wishes to give him the chance to die in his own home; but a late case shows how speedily such a prisoner may recover his health. Just now one of the suffragets who were sent to prison for an attack on Mr. Asquith at the Dublin Theater has been pardoned because she has lost her health by trying to starve herself to death, which the keepers tried to prevent by forcible feeding by a tube. Now Mr. Bernard Shaw says that if such a prisoner tries to starve she should be allowed to die. That is questionable. There are cases in which suicide may not be without excuse, as when a man has killed his wife and then kills himself. We are glad the wretch has been got out of the way. But yet suicide is a crime, and the attempt is punished by law. We can see no reason why, if these two women refuse to eat, they should not be fed by force. To be sure, they are undesirable persons, but so are all malefactors. The world would be better if they were out of it, but the state cannot help them all out of it, or stand by quietly and see them kill themselves, advantageous as that might be to the community. The world does not want criminals, and Canada refuses to let these violent women be admitted to its shores. We presume that if Miss Pankhurst, who has escaped to France, and who has been warned by the French Government that any attempt at annoyance of Premier Asquith during his visit will be followed by expulsion, should attempt to come to this country she would be refused admission, just as if she had trachoma. It is not easy to see that her illness was any reason why this criminal should have been pardoned and set free. There are hospitals connected with prisons, and many another prisoner has died in them.

The Ulster Hysteria

Now is the time when, by the tens of thousands, men in the north of Ireland, all Protestants, are signing a covenant that they will not submit to an Irish Parliament, but will refuse to obey its laws and will fight against it. Of course, this threatens sedition and rebellion, but this is becoming a holy war, a sort of jehad transferred from Islam to Ireland. The Anglican bishops of Ulster urge their people to unite and ordered a prayer against home rule to be repeated in the churches; and the Moderator of the Irish Presbyterian Assembly advises the ministers to open their churches for meetings against home rule, and the people to sign the new covenant. But not all the ministers obey, for it is said that two hundred out of five hundred believe in home rule—a very surprising statement. The men are already fighting in the streets, and this week will be the culmination, when we may expect many heads to be broken, but this is the Irish way on both sides. The army is held in readiness to quell disturbances, but what the army will do is not so very certain, as a multitude of officers and men are declared to be ready to join the Ulster men. That the Government will yield we do not believe, but it is possible that it has in mind the larger plan of devolution outlined by Mr. Churchill in a late speech, in which case England will have four local parliaments, and Ireland might have two.

The Future of Art

"In fifty years' time there will be no art," says George Moore, novelist and critic. "There will be no more great poets in English, French or any other language, "rubbed and worn by use," says Edmund Gosse, librarian and biographer. These are sad sayings, and we refuse to accept them as veracious. But Mr. Gosse's point is all the same suggestive. "The poetry of the future,"

he says, "will be largely written in languages which have been subjected to less wear and tear—languages which have not so extensive and complicated a literature, and in which simple things can still be said without affectation and without repetition." This is the point of view which has inspired Frédéric Mistral and his fellow poets of the Provençal revival, and equally that of some of the Irishmen who have been using the English speech of their fellow countrymen (or a dialect founded upon that speech) for their most striking effects. "In a good play," said the late John Synge, "every speech should be as fully flavored as a nut or apple, and such speeches cannot be written by any one who works among people who have shut their lips on poetry." The newspaper, with its tendency to standardize (upon a level of mediocrity) conversation, thought and all expression, is, perhaps, the arch enemy of local picturesqueness in language.

Biblical Scholarship Condemned

Following Duchesne's condemnation came that of Lagrange, the famous biblical scholar, head of the Biblical School at Jerusalem and editor of the *Revue Biblique*. Of the former's books only one is banned, but all—*"opera omnia"*—of Lagrange, even as books of reference. This will affect only seminarians and laics, as all professors have faculties to read, consult, refute condemned books. Duchesne is fortunate in that he holds office under the French Government and is therefore officially beyond Jesuit attack. Lagrange, however, is a Dominican or Black Friar and enjoys office by courtesy of his order. He has been obliged to resign the headship of the Biblical School at Jerusalem. There was a day when the Black Friars were good fighters and bested many a time the Clerks regular, commonly called Jesuits. Today the former are weakened. Lepidi, the Dominican Papal censor, has been brushed aside; the Biblical School at Jerusalem must take second place to the new Jesuit Biblical Institute in Rome; and lastly, the greatest Scripture scholar of the Friars, with all his works and fame, must go by the board. Moreover, Lagrange's removal entails that he resign the editorship of *La Revue Biblique,* and no doubt also either its suspension or a complete change in its editorial staff. And yet within four or five years fifth rate scholars will be publishing works of the Bible, mainly compiled by scissors borrowed from Lagrange.

Concerning Biftek

A contributor to our Education Number spelled the French substantive masculine *bifteck* (or *biftek*) with an intruded *s*. He must have gone by ear rather than by the dictionary—for tho more than one waiter in Paris sounds a mild sibilant in urging steak upon his patrons, the lexicographers are not with him there. As for the meat itself, tho Academicians knew it not by name till 1835, they ate it long before. Thus the Immortal who wrote the "Genius of Christianity," and had it published just a hundred years ago, invented what is, doubtless, the most succulent form of beefsteak known to gastrology: the *biftek à la Chateaubriand,* or, if you prefer, *bifteck-Chateaubriant.* This steak is to be best enjoyed with a pile of crisp *pommes paillées,* but whether Chateaubriand ate it thus we know not. Mr. Philip Hale, Boston's critic of music and the table, is authority for the assertion that the *biftek-Chateaubriand* dates from the period of its author's service as Ambassador of France to the Court of St. James; but that statement is reproduced here subject to correction. Certainly the steak served in his style is a noble tenderloin grilled between two thinner and inferior steaks, whose juices, impregnated with good seasoning, enrich it past belief. The inner steak alone is eaten; the envelopes are never seen by the *Buphagus.* When one orders and consumes a good Chateaubriand, at any one of a certain half dozen little restaurants in the capital of France, he is quite indifferent as to the spelling of the dish: beefsteak or *bifsteck* or *biftek.*

When one thinks of it, it is a surprising statement made by Dr. P. Chambers Mitchell, in his late address as president of the Zoological Section of the British Association, that he does not know of a single important addition to domesticated animals since the remotest antiq-

uity. Our savage ancestors domesticated at least three species of the ox family, but our bison is not domesticated. They domesticated sheep and goats, but we have failed to do as much for other very important species. The reindeer has served Laplanders for unnumbered generations, but we have failed to do as much with moose, elk and deer. The Spaniards found the turkey domesticated on this continent, and it is the only creature which the New World has added to the use of the Old, for the llama is still confined to transportation in the Andes. Attempts to domesticate the grouse or quail have not been very successful, and our wild ducks and wild geese are still untamed, as are a number of other large edible birds which would be worth centuries of labor to domesticate, as the ostrich has been subdued in later times.

President Jordan is right in calling attention to one of the causes of high prices not sufficiently considered. It is the waste of money, entirely unproductive, caused by the tremendous increase of the armaments of war. Thereby a multitude of men—soldiers, marines, builders of warships, artillery, etc.—are diverted from profitable production and have to be supported by the lessened number of those who cultivate the earth and make an honest living by providing the comforts necessary for life. It is not the luxuries — jewelry, paintings, racing yachts, etc.—whose increased cost disturbs us, but that of food and clothing, the necessities of life. The world destroys thousands of millions of wealth every year for military purposes, and it raises the cost of every barrel of flour or pair of shoes. It is not the only cause of the increased cost of living, but it is a serious one. Why continue it?

Japan's elder statesmen are passing away. They form a sort of close advisers to the Emperor, a kind of Privy Council, but more effective than that of Great Britain, and they are called the *Genro*. Prince Yamagata's health is precarious, and one or two others are not strong; and the appointment of Prince Katsura to the post of Lord Keeper of Privy Seals and Grand Chamberlain will bring him into close confidence with the young Emperor, and will assure him admission into the narrow circle of the *Genro*, who stand outside the political parties. Marquis Saionji is at the head of the Government, and the two men are in harmony as to reforms, and their influence will be great in the new succession.

It is a surprise to learn from a pamphlet put forth in support of the Taft administration and addrest to negro voters, that there are 60 per cent. more colored people now employed by the Government than when Mr. Taft became President. They must be mainly in the North, for it has not been his policy to appoint negroes to responsible positions in sections where it would be resented. Mr. William H. Lewis, Assistant Attorney-General of the United States, a colored man, says that at the Roosevelt convention in Chicago he heard the strains of "John Brown's Body," and then saw negro delegates rejected because they came from the South.

Of President Lincoln's Emancipation Proclamation Governor Wilson says in his history:

> "The proclamation when it came was no law, but only his (Lincoln's) deliberate declaration of policy for himself and for his party, and changed, as he meant that it should change, the whole air of the struggle and of politics as well."

This appears to us to be a perfectly truthful and innocent interpretation; and yet Chairman Hilles, of the Republican National Committee, interprets it as meaning that "Lincoln abolished slavery to further his own political ambitions and those of his political party." We can find no such sinister meaning in it.

A correspondent of the London *Tablet* commends to tourists as a summer resort the pleasant little Welsh village named Llanfair-pwellgrongllgogerychwryindrobwllansantysiliogwogoch. One advantage of a residence there would be undisturbed seclusion, for only the most devoted of correspondents could remember the address and not every picture postal would hold it. But

cumbrous as the name is it occupies less space than the English of the same content. Translated, its literal meaning is "Church of St. Mary, in a hollow of white hazel, near to a rapid whirlpool to St. Tysilio's Church, near to a red cave."

The Roosevelt party has put female suffrage into its national platform, and pledged its candidates to support it. But in the campaign for equal suffrage in Ohio Mr. Roosevelt spoke before the constitutional convention, but said nothing of equal suffrage, nor did he when flying around the State, neither did Governor Johnson, of California, while James Garfield, of Cleveland, who is Roosevelt's right-hand man, is openly opposed to woman suffrage. The women lost their amendment, but now, under initiative, they can force attention to their claims and they will do it, and expect to succeed.

A British physician has reported to the Sanitary Institute Congress that little progress has been made in the last 200 or 300 years in advancing the efficiency of vessels for washing the human body. The following was, he said, the order of frequency in bathing among certain nationalities and the sexes: Scotchmen, Englishmen, Irishmen, American women, English women, American men, Frenchmen, and Germans. And is it true that American women are ahead of American men in cleanliness as well as everything else?

In a late Sunday address Cardinal Farley said:

"People of other religions are coming to us for guidance and assistance. The Methodists, Episcopalians, and all other religions here do not know how to introduce religion into the education of their children. They have no system, and no plan of campaign."

It is a pity that "Methodists, Episcopalians and all other religions" have to learn that they have no system of religious education. We warrant that the pupils of their Sunday schools, and of the public schools, grow up as decent and lawabiding as the pupils of the parochial schools, and keep as well out of the penitentiary. And why "other religions"? Are not Methodists, Episcopalians and Catholics all believers in the one Christian religion?

Cardinal Gibbons is opposed to woman suffrage, because of the danger of breaking up families. He said in a late interview in St. Louis:

"Equal suffrage, in my opinion, would tend toward increasing divorce, which is a social blot on the United States and is the greatest evil of the day. If woman had equal political rights with men there is a probability that on the slightest provocation she would seek divorce."

It must not be understood that this represents the position of the Catholic Church, for the Cardinal of Australia favors the reform.

From the office of the Surgeon-General of the Army we receive a correction of our statement that "the demonstration that yellow fever is conveyed by the mosquito came as the result of the labors of the United States Marine Hospital Service in Cuba just at the beginning of the present century." We are told that it was made by a board of which Major Walter Reed was president, consisting of surgeons of the Medical Department of the Army.

Presbyterianism in Canada is in a bad way if we may trust *The Bible Student and Teacher,* a magazine devoted to the task of defending the Bible against any invasion of higher criticism. It explains the fact that Knox College has so few students for the ministry by the statement that "in open violation of its charter, Professors McCurdy, McFadyen and Mathews have made it a hotbed of rationalism."

The decision of the question whether the religious garb shall be allowed in the Indian schools is settled by the decision, which ex-Commissioner Valentine does not criticise, that the teaching nuns will be allowed to continue as hitherto, but that their successors will be appointed by civil service examination, and will wear citizens' dress.

Utopia is a state of society where a genre picture is impossible.

Insurance

Insurance Laws and Legislation

In a concise and rapid review of the legislation attempted and enacted in 1911, affecting the business of life insurance, prepared by the Hon. Robert Lynn Cox, general counsel of the Association of Life Insurance Presidents, for *The American Political Science Review,* the amazing fact is developed that the total number of statutory requirements of a general character in force on this subject in the various States approximates forty-five hundred. This figure is exclusive of the numerous local laws which are applicable only to the domestic companies of the individual States. The difficulties encountered, the expense incurred, by life insurance companies transacting a general business thruout the United States, in their efforts to guide their footsteps by the multicolored lights of this wilderness of lamps, tax the imagination. "At the home office of all the companies of considerable size," observes Mr. Cox, "there are various officials whose duties largely consist of keeping track of the statutory requirements in the different States and seeing that their companies conform to all of them." Then he adds: "This is expensive, but it would be still more expensive to violate any of these provisions, even innocently."

Tax laws comprise but one of the subjects and under these the annual cost to the policyholders, steadily rising every year since insurance legislation became a prime topic among lawgivers, has now reached an approximate sum of $12,000,000. It is an argument of no force to assert that the maintenance of insurance on their lives by a portion of the people is a form of thrift that should in every way be encouraged and, as such, should not be taxed by the State, for it must be admitted that all taxable values represent the thrift of their owners; but it seems apparent that the burdens imposed by our tax laws on life insurance, the nature of its purposes considered, are much heavier than they justly should be. It assumes almost the proportions of a penalty. As Mr. Cox points out, it is exacted chiefly as a revenue proposition for the benefit of the public generally. Granting that supervision of the companies is essential to the safety of the premium paying public and that its cost should be borne by them, how are we to square the policy of the State that collects forty times the cost with the principles of justice? According to a calculation made by Mr. Cox on the basis of the statistics of 1907, the ratio of the actual cost of all insurance supervision to the amount of taxes collected from life insurance alone ranged from 2.6 per cent. to 20.2 per cent. That is to say of every $100 collected in taxes, the cost of supervision ran from $2.60 to $20.20. The State in which the ratio was 2.6 per cent., we are told, collected in excess of a million and a half dollars, while the expense incident to maintaining its insurance department was but slightly in excess of $40,000. We are bound to admit the unrighteousness of such a policy, and it points to conditions for which policyholders should seek remedies in their respective legislatures.

Reference is made by Mr. Cox to the experiment which the State of Wisconsin is about to make as an insurer of lives under the general management of the executive officers of the State, including the Commissioner of Insurance. Of course, the belief must exist that such an arrangement will provide life insurance protection cheaper than can the companies. Life underwriters will study the effort with interest, particularly regardful of the means adopted and the degree of success achieved in overcoming two fundamental weaknesses: the vicissitudes of politics and the absence of canvassers. The experience of the companies proves conclusively that the vast majority of insurable persons cannot be depended upon voluntarily to insure their lives, and that solicitors must be employed to point out its advantages and induce them to do their duty? Will they act differently if the State is the insurer? Then there is that other stumbling block—politics, factions, frequently changing managers. Could a life insurance organization survive these mutations.

Financial

Investment Security Advice

In the selection of an investment security, as in the selection of a piece of furniture or an automobile or anything else, suitability is the consideration of primary importance. The country doctor doesn't need a six-cylinder touring car that can make 90 miles an hour and climb up the side of a wall. The average investor doesn't need a security that is a first mortgage on a $200,000,000 railroad, and that has a big market at every eighth. The country doctor who buys that sort of an automobile and the investor who buys that sort of a bond are both doing the same thing—buying qualities they don't need and paying a high price for them.

Just as an automobile has certain qualities—speed, capacity, power, etc.—a bond has certain qualities. Four of them are particularly important. They are: (1) safety, (2) marketability, (3) rate of income, (4) chance of appreciation in value. A bond that was absolutely safe, that had at all times a ready market, that paid a high rate of interest and that had a good chance of increasing in value—such a bond would be the ideal form of investment.

But the ideal in investments, like the ideal in anything else, is difficult of attainment. In few if any securities are all four of the qualities mentioned to be found developed to any considerable degree. Is a bond particularly safe and marketable?—if so, the chances are that it sells so high as only to yield a small income. Is a bond safe and selling on a basis to yield a full return to the buyer?—in ninety-nine cases out of a hundred it will be found that its market is a narrow one and that it cannot readily be converted into cash. That is always the way. The possession of each quality works against possession of the others.

That being the case, the thing for the wise invesor to do is first to figure out his needs and then to confine his attention to such securities as have the qualities which he most requires. I am, say, a man well along in years, and likely soon to become dependent upon the income from my investments. Safety, in that case, and a full interest return, are what I particularly need—for me to buy a highly marketable security, for instance, would simply be to pay out money for something not wanted. And no less true would that be true, say, of a young man engaged in a successful business, who, having surplus money to invest, should wrap it up in the napkin of some gilt-edged first mortgage railroad bond. Safety, with him as with every other investor, ought to be a primary consideration, but, situated as he is, he owes it to himself to put his money where it will have a chance to increase. Possible price appreciation is the quality he should seek, even tho it is there at the expense of the others.

And so it is—each investor according to his needs. Which qualities do I particularly require, which can I best do without?—that is first. Then, To what degree does this particular security have the qualities I need?

By sticking to bonds which are absolutely safe and which have a ready market you cannot, of course, go far wrong, but you can very easily by losing income and a chance of appreciation of principal which you might just as well enjoy. To have a bond a little bit of a mortgage on a huge property and to know that at any moment you can convert it into cash is a very comfortable feeling, but a luxury which, like all other luxuries, costs money. Where the amount of your principal is so great that you don't care whether it increases or not, and where your income is such that you don't care whether your bonds net you 4 per cent. or 5, you can afford the luxury. Otherwise you can't and are obliged to apply to your investments the test of suitability.

....An agreement has been reached as to the proposed freight yards, terminals, and freight and passenger stations at Chicago, in which fourteen railroad companies are interested and which will involve an expenditure of $200,000,000.

The Independent

VOL. LXXIII NEW YORK, THURSDAY, OCTOBER 3, 1912 No. 3331

Survey of the World

Mr. Taft's Week Last Thursday President Taft attended the session of the International Chambers of Commerce at Boston. He was cordially greeted by Governor Woodrow Wilson, who stayed overnight at the President's hotel.——One day earlier Mr. Taft was in Altoona, Pa., helping to celebrate the semi-centennial of the meeting of the fourteen war Governors who pledged to President Lincoln their loyalty and support. Mr. Taft declared that this country is entering upon the most prosperous period in its history.——Earlier in the week the President told a delegation of postmasters that he favored the plan of their National League for extending the civil service law to third and fourth class postmasters. Its legality will be studied by the Attorney-General and the Postmaster-General.——Mr. Taft issues a long statement treating the issues. He defends the protective tariff, while calling for revision "to keep prices from being exorbitant"; opposes the third party plan for trust regulation; discusses the monetary problem, the Nicaraguan situation, the recall, immigration, etc. "Suffrage for women is an issue to be decided by the States," according to the President. In the current issue of the *Century Magazine* Mr. Hillis gives Mr. Taft's reasons for regarding socialism as a menace.——Speaking at Beverly, Mass., on the 28th, Mr. Taft attacked the Democratic tariff program and the third party, which he declared to have split off from the Republican party "not for any one principle, or indeed on any principle at all, but merely to gratify personal ambition and vengeance." He attacked the Progressive platform as a "crazy quilt," stated that the movement would collapse were its standard bearer to be removed, and declared that "fortunately there is not the slightest chance of the success of the third party."——Governor Hadley of Missouri opened the Republican campaign at St. Louis on the 28th, stating that "there are at present only two candidates before the American people. They are Taft and Wilson. Of these I prefer Taft. While there were some conditions surrounding the Chicago National Convention of which I did not approve, I believe Taft will be the best man to solve them."

Mr. Roosevelt Down South On October 2, Mr. Roosevelt was to finish his 10,000 mile journey thru twenty-seven States. The candidate began his canvass of the South last week in southwestern Missouri. He believes that he has a fighting chance in that State, in Tennessee, Louisiana, Georgia and North Carolina. Mr. Roosevelt said that Champ Clark carried the Missouri primaries, but "the bosses did not want him nominated"—wanting another candidate; "and they got him by overriding the vote of the people in not only this but in every State whose primaries Mr. Clark carried." (Just after Woodrow Wilson's nomination Kermit Roosevelt told State Senator F. D. Roosevelt, the Democrat, "Pop prayed for Clark!") The action at Baltimore was, Mr. Roosevelt continued, "as wilful a disregard of the desire of voters as was evidenced in the Republican convention at Chicago." Mr. Roosevelt told his hearers: "We propose to pass prosperity around." His reception in Oklahoma was highly enthusiastic. In Arkansas he called for a greater navy

and advocated the employment of the Panama Canal force for the deepening of the Mississippi. At New Orleans he scolded the Democratic Congress for voting to remove the duty on sugar—sugar being a staple in that State. He declared that on election he would carry out the plank of his platform with respect to the conservation of the Mississippi River, and to this end would place Colonel Goethals in charge of the work. This would mean the reclamation of an immense area of swamp lands, enough to make a State larger than Illinois.——At Boston, on the 27th, Governor Wilson said he did not wonder that Mr. Roosevelt "thinks trusts are inevitable."

"He never found any way of checking them, and he thought it was inevitable that the Steel Corporation should buy the Tennessee Coal and Iron Company, and that the Chief Executive should consent to an illegal thing in order to build up an irresistible power."

Governor Wilson declared that if Mr. Roosevelt were elected he could have "no third-party Congress behind him," and would be unable to carry out his proposals. At Atlanta, on the 28th, Mr. Roosevelt accused Governor Wilson of falsifying his views upon the trust question. This followed a demonstration in favor of the Democratic candidate, who for three years practised law in the city; but there was no lack of enthusiasm for the third party candidate. Mr. Roosevelt stated that Taft and Wilson occupy the same position with regard to the trusts, "the position the Wall Street magnates thoroly approve," and added that Governor Wilson "does not know the present day life of this nation."

Governor Wilson and the Issues

On the 29th Governor Wilson issued a statement in regard to the coming Democratic convention at Syracuse, which will nominate the New York State ticket. Governor Wilson has wished to avoid "even the appearance of doing what I condemn in others, namely, trying to dictate what a great party organization should do, what candidates it should choose, and what platforms it should adopt," but demands an unbossed convention and a ticket as free as those headed by Mr. Straus and Mr. Hedges. ——In "protected" New England Governor Wilson discussed last week his tariff policy, defining his purposes as the unearthing and cutting out of special privilege, "without affecting that part of business which is sound and legitimate." He referred to the "fraud" of calling ours a "protective" tariff in the face of the conditions uncovered at Lawrence. At New Haven, Governor Wilson exprest admiration for President Taft as an individual, but added:

"The President said the other day that if the Democratic party was put in power there would come a series of rainy days for those engaged in the industries of the country. I recall the time when he condemned that preposterous Schedule K, under which the wool monopoly flourishes, and I want to ask him if he doesn't think that rainy days came long ago to the poor mill hands in Lawrence, Mass. What kind of days are those that are enjoyed by some of the employees of the overshadowing steel monopoly, who have to work seven days in the week, twelve hours every one of the seven, and can't, when the 365 weary days have past and a year is told, find their bills paid or their little families properly sustained? Are they waiting for rainy days?"

Governor Wilson also paid a tribute to Senator La Follette, and referred to Mr. Roosevelt as "the understudy to Providence." Speaking at Scranton, Pa., on the 23d he again referred to Mr. Roosevelt's promise to put the protective tariff "prize money" in the pay envelope, saying, "I want to know how he proposes to get it there." The Governor said he had searched the third party's program without enlightenment on this point—unless the proposal for an industrial commission charged with supervising the great monopolies formed under the tariff is to be entrusted with the task of looking after labor.——Governor Wilson says:

"I am a Progressive because we have not kept up with our changed conditions. We have not kept up as well as other nations have, and unless we move our practice up to the facts, the facts will have the better of the argument, because law trails along after the facts, and only that law is unsafe which trails along after the fact and makes it follow imaginative progress and will-o'-the-wisps."

He declares his approval of the direct popular election of United States Senators, the initiative and the referendum. The recall of judges he does not approve, not because some judges do not deserve to be recalled, but because this remedy for actual ills is superficial.—— Governor Wilson was scheduled to start West again on October 2 for a ten days' tour.

Dr. Eliot on the Presidency

The president-emeritus of Harvard University returned from a round-the-world trip in the interests of world peace five weeks ago. After studying the situation "from the point of view of a non-partisan who has generally voted the Republican ticket," he issues an open letter advocating the election of Governor Wilson. The issues are, he says, "the prompt and effective reduction of the high tariff" and the amendment of our political system. The Republican party is strongly protectionist and conservative on the constitutional questions; the Progressives are protectionist, but constitutionally radical; the Democrats favor "a tariff for revenue with no destructive immediate reductions," while they are, on constitutional questions, "more conservative than the Progressive party, less conservative than the Republican." Judging by its history and recent action, the Democracy "seems likely, under its new leaders, to accomplish a judicious and effective reduction"—to which it is fully pledged. The Progressive party "cannot be trusted to deal wisely with the tariff" both because of its membership and because of its protectionist platform.

"Moreover, its candidate, ex-President Roosevelt, has never shown any acquaintance with tariff questions, any interest in them, or any comprehension of the disastrous effects of the tariff on American industries and on the prices of the necessaries of life to consumers. His present utterances on the subject are contradictory and vague, and yet likely to mislead the farmers, mechanics and operatives from whom he asks votes."

Discussing the humanitarian impulses of the Progressive Party, Dr. Eliot warns against "the sudden, impetuous rush of an emotional multitude." The Democratic program promises "a wise dealing with the reforms proposed." Also, Governor Wilson's statements "are much more prudent and measured than those of ex-President Roosevelt."

"The coming troublous years will call for fairness, sober judgment and quiet resolution in the executive. Governor Wilson's career gives many indications that he possesses these qualities. Thru thirty years of public life ex-President Roosevelt has proved that these are not his characteristics."

Both the Progressive and the Democratic parties propose "serious changes in the political usages of the people"; the executive should, therefore, be no "impulsive, self-confident, headstrong man, impatient of restraints and opposition, and given to the use of extravagant language. . . . The candidate of the Progressive party has shown himself capable, while in power, of taking grave public action—which of course seemed to him wise and right—in disregard of constitutional and legal limitations, and, while out of power, of proposing rash changes in the relations of the judiciary to the other departments of the Government and to the voters." Furthermore, the precedent of giving a third term to any President, "with or without an interval," is undesirable. And Mr. Roosevelt is "a personage peculiarly unfit" for a third term, "because he loves power, ardently desires to exercise the President's power again, and has procured his own nomination by direct personal effort, at the cost of splitting the party to which he owed his previous opportunities." Dr. Eliot condemns Mr. Roosevelt's "untimely" and "intemperate" criticisms of the arbitration treaties with Great Britain and France, which was in fact responsible for their defeat. Dr. Eliot's letter, written at his summer home on Mt. Desert Island, Me., and addressed to the editor of the New York *Times*, concludes: "Second and third terms may or may not be expedient on general principles, but this particular proposal for a third term is unquestionably inexpedient. These considerations have brought me to the conclusion that it is best to vote for Wilson and Marshall."

The Socialists

On the 28th a crowd estimated by the Socialist press at 21,000 greeted the Presidential candidate, Eugene V. Debs, at Philadelphia. On Sunday afternoon an equally great number attended a meeting in Madison Square Garden in New York. Mr. Debs, Emil Seidel, C. E. Russell and other Socialist candidates addrest the meeting. Mr. Seidel, nominated for Vice-President, attacked Mr. Roosevelt, and Mr. Debs disparaged Governor Wilson, and the Lawrence situation was discussed. A large collection was taken up.——Action taken by the Department of Justice on September 9 practically assures rights of

citizenship to Leonard Olson, of Seattle, a Socialist, whose case led to the impeachment investigation and consequent resignation of Judge Hanford, of that city, who denied citizenship to Olson because he was a Socialist. The case has been appealed to the Federal Court of Appeals, but the Department agrees to a reversal of the Hanford decision, thereby eliminating a court contest.

Politics

William Hughes, ex-factory hand and a member of the House of Representatives until appointed by Governor Wilson judge of the Court of Common Pleas, of Paterson, is the choice of the New Jersey Democrats for United States Senator. He defeated ex-Senator James Smith, Jr., in the primaries of last week by over 20,000 votes. He carried every county but Essex, and carried Essex outside of Newark. This is a victory for Governor Wilson over the former boss of New Jersey. Smith's lieutenant, another anti-Wilson Jerseyman, got the worst of it in the primary elections. James R. Nugent, formerly Democratic State chairman, was arrested on charges of obstructing arrest, rescuing a prisoner from the police, assault and battery and carrying concealed weapons. Mr. Nugent was held in $8,000 bail.——The treasurer of the Democratic National Committee calls for from $750,000 to $900,000 more to elect Governor Wilson. About $300,000 has been subscribed, and all but $84,000 spent. The State of New York has furnished more money than any other, and Justice Gerard has made the largest individual subscription, $13,000. Samuel Untermeyer follows with $10,000. Governor Dix has sent in $100, but neither the Tammany chieftain nor Mayor Gaynor has contributed.——Mr. Bryan is campaigning for Wilson and Marshall in California. In Los Angeles he made four speeches on the 23rd, addressing 30,000 persons.——Job E. Hedges, a graduate of Princeton College and the Columbia Law School, and a well known speaker of strong humor, was nominated last week for Governor of New York by the Republican State Convention. The nominee for Lieutenant Governor is James W. Wadsworth, Jr., a former Speaker of the Assembly. The State platform attacks the costliness of the Dix administration, declares for civil service reform and for workmen's compensation, and attacks the Progressive party program. One clause is the following:

> "We favor submitting to the voters in 1915 a constitutional amendment enfranchising women, unless a constitutional convention is to be held prior thereto as hereinafter advocated."

Senator Root made a notable address at the convention, and was a prominent figure at Saratoga; Mr. Barnes, of Albany, was in the background, but was nowise in eclipse.——Eugene Noble Foss was renominated as Democratic choice for Governor, to succeed himself, at the Massachusetts primaries on the 24th. His plurality was 27,294. Joseph Walker is the Republican nominee.——Mr. Hearst continues to publish letters exchanged by Republican politicians and John D. Archbold, of the Standard Oil Company. A letter written by Mr. Sibley, a representative of Pennsylvania in Congress, dated October, 1904, invites Mr. Archbold to Washington on behalf of Mr. Roosevelt, adding: "In official life, the invitation of the President is regarded in the nature of a command," and continuing: "You will get a first class reception." A letter of Senator Penrose's is interpreted as an acknowledgment of the Oil Trust's check for $25,000.

Labor

Twelve thousand mill operatives walked out without warning at Lawrence, Mass., on the 26th and 27th, protesting in the case of Messrs. Ettor and Giovannitti, organizers for the Industrial Workers of the World, and charged with being accessories to a murder committed during the strike riots of last January. These labor leaders have been held without bail for eight months. The trial was scheduled for the 30th, and the strike seems to have been called with a view to warning the Government against prosecuting the case. On the night of the 28th it was determined that the strike would take effect officially for twenty-four hours, beginning on the morning of the 30th, when riots occurred. William D. Hayward declared at Chicago on the 28th

that if Ettor and Giovannitti are convicted,

"God only knows what will happen. There are one million textile workers in America. I do not advocate force, but Lawrence is a foreign settlement. Forty-three languages are spoken there. The people are ignorant of laws. They only know that their employers control the courts. I would not be surprised to see the strike spread and become general thruout the country in other trades."

——The strike of 9,000 miners in the Panther Creek Valley, Pennsylvania, which has lasted four weeks and cost $150,000 in wages, because two men refused to wear union buttons, was settled on the 27th, when the strikers voted unanimously to return to work. The employers, the Lehigh Coal and Navigation Company, have agreed to send the two nonunion workmen away on an unlimited vacation.——Augusta, Ga., was last week declared under martial law. This followed disorders in a street railway strike. State militiamen are on duty, but up to Monday cars were not running.

In Mexico Rumors that the United States had presented an ultimatum to the Madero Government circulated last week, but were denied. No notable improvement in the situation can, however, be reported, for many States teem with rebels and brigands. Amnesty was offered to the followers of Pascual Orozco on the 25th, and Madero asks his Congress to authorize a loan of $10,000,000 to prosecute the civil war. The chief of police of Mexico City admits that the Government has sold to the Zapatistas in the South 40,000 Mauser cartridges loaded with nitro-glycerine. The cartridges cannot be distinguished from regular ammunition, but on firing explode with a terrific report, killing or maiming those who fire them off. The sub-committee of the United States Senate, which, under the presidency of William Alden Smith, has been investigating relations with Mexico, is convinced by its researches at Los Angeles and elsewhere that large quantities of munitions of war were shipped across the border into Mexico while the Madero revolution was in progress. Had the shipping of arms and ammunition been freely tolerated since then, Orozco would long ago have reached Mexico City, according to the committee report, as forecasted unofficially.

Nicaragua Nicaragua's revolution seems to have collapsed with General Luis Mena's surrender to Rear Admiral Sutherland, United States Navy, on the 24th, altho Mena's lieutenant, Zeledon, is still at large. The rebel general was placed aboard the cruiser "Cleveland" on the 28th, to be taken to Panama, whence he is to go into permanent exile in Europe. The rebel leader is a sick man. When the Americans reached Granada they found the inhabitants in need of the relief which they were prepared to give. Presumably an election will now be held under the protection of the Americans.

The Ulster Demonstration Sir Edward Carson concluded his anti-Home Rule campaign by being the first to sign with a silver pen the covenant at the mass meeting in the City Hall of Belfast. Over his head was displayed the flag of King William at the battle of the Boyne, and he was surrounded by a bodyguard of 200 Orangemen and Unionists with bright sashes and wands. The covenant, which we printed last week, pledges the subscribers to th use of "all means which may be found necessary" to defeat Home Rule and to the refusal to recognize the authority of an Irish parliament. The meeting was a solemn one and applause was discouraged, tho it could not be entirely represt. The service opened with the hymn, "O God, Our Help in Ages Past," followed by prayer and the reading of the lesson from Isaiah xxvi:1-9, beginning, "We have a strong city," after which the sermon was preached by the Rev. W. McLean, former moderator of the Presbyterian Church, who said that the Home Rule movement was at bottom a war against Protestantism and an attempt to establish Roman Catholic ascendancy in Ireland and to begin the disintegration of the British Empire. Ministers of the Church of Ireland and of the Methodist and Congregational Churches assisted in the service. Following Sir Edward Carson, the covenant was signed by the Marquis of London-

derry, the Lord Mayor of Belfast and members of the city council, and during the day by 30,000 members of the Orangemen and Unionist organizations, who marched thru the streets in processions to the hall. Contrary to the general expectation, there was no rioting or other disturbance in Belfast. All the factories and shipyards were closed and the city was in holiday mood. In the evening Sir Edward Carson was escorted to his boat by a torchlight procession and blazing beacons on the banks lighted him down the Lough.

Naval Maneuvers

The withdrawal from the Mediterranean of the greater part of the British fleet, hitherto stationed there, and its concentration in home ports where it can

SIR EDWARD CARSON LEAVING BELFAST TO START HIS WAR AGAINST HOME RULE

be made to bear directly upon the North Sea, has now been followed by an equally significant movement, the concentration of the French fleet in the Mediterranean. Very naturally Germany looks upon these changes of base as resulting from an understanding between France and England to use their forces in combination against the Triple Alliance; England to keep guard over Germany in the north and France to hold in check the Italian fleet and the new fleet which Austria-Hungary is now building. The Triple Alliance, established in 1882 and renewed every ten years, expires next year unless renewed, and the German papers claim that these naval movements are designed to detach Italy from the Alliance since her interests are now by the acquisition of Tripoli more than ever dependent upon her naval power in the Mediterranean, where Germany cannot help her and where Austria may be a rival rather than an ally. The Paris *Temps,* in a series of articles, doubtless semi-inspired, asserts that the concentration of the French fleet in the Mediterranean cannot possibly be regarded as a threat against Italy, and points out that in 1882 Bismarck refused to accept Italy's proposal that the Triple Alliance should include the Mediterranean and that in 1898 and 1902, Prince Bülow declared in the Reichstag that the Franco-Italian agreements did not impinge upon the ground covered by the Triple Alliance. Therefore, argues the *Temps,* Italy has a double policy; a continental, in which she is allied with Germany and Austria, and a maritime in which she is in agreement with France, Russia and England. On land Italy might belong to the Triple Alliance, but on the sea she would naturally be associated with the Triple Entente.

The Prospect for Peace

This is a topic that calls for consideration at the present moment, yet nothing satisfactory can be said of it. On September 28, 1911, the war began with a proposal by Italy for the annexation of Tripoli and altho the ultimate outcome of the conflict was never from the first in doubt, yet now at the end of a year the fight is still going on and there is no definite assurance of its speedy cessation. The invasion united the Turks and Arabs of Africa, and they have been surprisingly successful in keeping the Italians from penetrating into the interior of the Continent, yet all their valor seems in vain, since they cannot prevent annexation nor apparently secure any more favorable terms for Turkey than Italy would have granted at the beginning. The strain upon Italy has been severe, not so much the loss from death and sickness, for this has been comparatively small, but the expense of an oversea campaign for a year is hard for a country with such a narrow financial margin. Nevertheless the Italians, ordinarily discontented and unruly, have risen to meet the emergency and submit willingly to all necessary sacrifices. The Government has been obliged to call 40,000 more men into active service, the class of 1890, which was on unlimited leave and the class of 1887, serving in the artillery, engineering and medical corps. The semi-official pourparlers at Chiasso, Switzerland, have been interrupted, tho whether this indicates approaching agreement or a permament disagreement is for the outside world a mere matter of speculation. In the meantime the internal and external dangers of Turkey are becoming more threatening. Deputies elected by the Cretans will make another effort to be admitted to the Greek parliament. In Samos a rising in favor of annexation has occurred and the conflict between the Turks and the insurgents became so serious that British and French bluejackets had to be landed to protect the consulates and foreign property. Both Servia and Bulgaria are showing unusual activity in military preparations and the war spirit is rising among the people, who feel that this is their opportunity to strike a blow at their ancient enemy. Apparently all that keeps them from making war on Turkey is the assurance of the Powers that even in the event of victory neither country would be allowed to increase its territory. Russia has added to the anxiety by suddenly mobilizing seven army corps of 35,000 each in the Polish provinces. The decision of the Turkish Government to hold military maneuvers near Adrianople is regarded as provocative by Bulgaria. The Malisoris of Albania have occupied Kastrati and Hoti

and are closing in about Scutari. What response Count Berchtold, the Austrian Minister of Foreign Affairs, has received in answer to his circular note asking for co-operation among the Powers on the Balkan question is not known to the public, but the tone of his address to the delegations of the Austrian and Hungarian parliaments is regarded as decidedly pessimistic. To give our readers an opportunity to try their skill at interpreting diplomatic language, we quote the following passages from his speech:

"Our chief intention was by unanimous co-operation on the part of the Powers on the basis of the maintenance of peace and the status quo to give the Porte time and friendly advice for the realization of its policy on the establishment of order. To our great satisfaction all the Cabinets agreed to the proposal whereby a valuable pledge was secured for preventing in every possible way a violent solution of the crisis. The Russian Cabinet, especially, is most earnest in the endeavors to insure peace.

"However, it would be a serious mistake if one were therefore to regard the present dangers in the Balkans as averted. . . . Notwithstanding the unanimity of the Cabinets in favor of peace a nowise reassuring display of sheet lightning in the Balkans gives proof of the existence of a high degree of electrical tension in the political atmosphere without throwing any light into the darkness of unsolved problems. Diplomacy is keeping guard to prevent the threatened conflicts and stifle a possible Balkan conflagration at the outset. Our geographical position places us near the area of disturbance; the great interests of this monarchy are at stake, and only when we are armed by land and sea can we look to the future with easy minds."

European Labor Questions

The Spanish railroad strike, begun in Catalonia, became general by a vote of the representatives of the Federation of Railroad Workers on September 27 and is still continuing. Very few trains are running except those in charge of the military corps of engineers, and even these have great difficulty in getting thru because of acts of sabotage, such as destroying signals, spiking switches and throwing stones at the trains. In consequence of this several trains have been wrecked and passengers injured. The directors of the railroad lines involved have exprest their willingness to grant the demands of the strikers, which would involve an addition of $25,000,000 to the wage list, if the Government would help them with a subsidy or authorize them to raise their rates. In Barcelona, where the strike has taken a revolutionary form, General Weyler, formerly of Cuba, is in command with 16,000 soldiers.——The congress of the revolutionary labor party known as the C. G. T. (Confédération Générale du Travail), in session at Havre, has shown by overwhelming votes its determination to pursue sydicalist tactics, altho the reformist arguments were ably urged upon them by M. Renard, who urged that the use of violence reacted against the working class and enabled the Government to put down the movement. The C. G. T. voted unqualified opposition and resistance to the Government pension bill for workingmen, and exprest approval of the anti-militarist propaganda being carried out in the army by the organization known as the "Sou du Soldat" ("The Soldier's Cent"). M. Chalopin, secretary of the Teachers' Union of the Seine, was elected chairman of the congress, as an expression of the sympathy of the syndicalists for the teachers' unions, which have been ordered dissolved by the Government because of their revolutionary and anti-militaristic proclivities. ——Prof. Gustav Hervé, editor of *La Guerre Sociale* and one of the most outspoken of the anti-militarists, was sentenced to prison in March, 1911, on account of his treasonable editorials. He was pardoned July 16 on recommendation of Attorney-General Briand. It appears that while in jail he experienced a change of heart and he now declares that his former utterances were misconstrued and that he has never been anti-patriotic or anti-militarist. On account of his present attitude he is regarded by the syndicalists as a traitor to their cause, and when he attempted to deliver a lecture September 26 in Paris on "Our Country" he was not allowed to speak because of the uproar in the audience, which resulted in a free fight, in which chairs and revolvers were used as weapons and eight persons were wounded. ——The Socialist Deputies Borchardt and Lienert, who took part in the disturbances in the Prussian Diet on September 5, were found guilty of disturbing the peace and were fined respectively $25 and $12.50.

Possibilities of a Democratic Administration

BY FRANCIS G. NEWLANDS

United States Senator from Nevada

I AM asked to give an outline of the probable program of the Democratic party should it come into full power in the legislative and executive departments at the next election. I would not, of course, pretend to speak authoritatively upon so important a subject, but I have no objection to giving my individual views, based on the party platform and the general trend of Democratic thought as displayed in party deliberations and action in Congress.

Revenue.—The first question to be considered is the national revenue, approximating one billion dollars, of which, roughly estimated, one-fourth comes from postal receipts, one-third from internal revenue taxes on tobacco, spirits, etc., one-third from customs duties, and the balance from the corporation tax and other miscellaneous receipts, such as sales of public lands, etc.

Of the existing taxes, therefore, the corporation excise tax (yielding a little over thirty million dollars annually) is the only tax that can be said to be levied upon wealth; and the revenue from this source equals less than one-thirtieth of the entire national revenue.

Leaving out of consideration constitutional restrictions and applying only fair dealing in the distribution of national burdens, it must be apparent that a system which fastens, approximately, 96 per cent. of the burdens of the National Government practically upon consumption and less than 4 per cent. on wealth is unjust, and should be corrected. Such correction should involve contemporaneous legislation reducing the tax on consumption and increasing the tax on wealth. The reduction will, necessarily, fall upon customs duties, for no change is likely to be made in the revenue from the postal service or the internal revenue taxes on non-necessaries, such as spirits and tobacco. All the tariff bills which have recently passed the House involved a net reduction in revenue of only sixty million dollars, and that it is proposed to make up by the extension to individuals of the excise tax of 1 per cent. on profits over five thousand dollars now imposed on corporations. It is probable that an income tax will be substituted for this when the pending constitutional amendment is adopted. It is safe to say that an income tax of 1 per cent. will furnish sufficient revenue to take the place of the reduction in revenue caused by the contemplated tariff legislation of the Democratic party. I state this in order to disarm the charge that any confiscatory attack is possible, and to prevent lawless wealth from arousing the fears of law-abiding wealth, with a view to obtaining, as it has so often, the latter's aid in political and legislative movements. Certainly a possible tax of one hundred dollars on an income of fifteen thousand dollars (five thousand dollars being exempted) cannot be considered confiscatory.

But it may be remarked that a reduction of only sixty million dollars in the burden on consumption is trifling. The answer is that for every dollar of high protective duties collected by the Government it is estimated that about ten dollars is collected by the manufacturers in enhanced prices. A reduction, therefore, of sixty million dollars in tariff duties means a reduction in the burden upon the people's consumption of approximately six hundred million dollars.

Why not, then, enlarge the area of relief by still further reductions in tariff duties? it may be asked. The answer is obvious. The reduction from a protective to a low revenue basis, if suddenly made, will largely increase importations, and thus displace American products in our markets and American labor in our industries. The Democratic party is op-

posed to radical readjustments, and has declared its purpose to feel its way gradually and prudently toward a revenue basis. Realizing that the American industries have become interlocked with a high protective system, it has declared its intention to accomplish its ultimate purpose in a way that will not impair or injure any legitimate American industry. In giving this assurance it will disarm the fear of the workers in the protected industries, numbering several millions, who, naturally affiliated with the Democratic party in sympathy, have been frightened by their employers into voting against that party on the ground that its policies constitute a menace to their employment and their wages. We will, at the same time, disarm the fear of wealth that radical increases will be made in its burdens. If we reduce our revenues from customs duties slowly there will be no reason for rapidly increasing the taxation of wealth. By pursuing this policy we will avoid the hysterical outcry against needed economic changes, which has so often beaten us; we will pacify labor, the manufacturer and law-abiding wealth, and we will steer clear of business depression and panic, than which nothing could be more prejudicial to our success either at the election or in subsequent control and administration of the Government. We must break up the habit of swinging like a pendulum from reform to monopoly thru the intermediate process of panic.

Budget Committees and Administrative Boards.—When the Democratic party comes into power it will doubtless take up most seriously the question of legislative efficiency. With the growth of our country the work of Senators and Representatives has been greatly increased, both outside and inside the legislative halls. The sessions have lengthened so that now they are almost continuous. The difficulty is that legislators attempt to cover too many details, and have not yet adopted methods of efficiency which have made such marked advance in business and corporate activities. In such activities the man of prominence largely succeeds thru utilizing the brains of others and thru the services of specialists.

As a means of securing greater efficiency in Congress it would seem that the organization of a budget committee in each house of Congress is desirable. Such committee could act in co-operation with the Executive Department in matters relating to efficiency and economy, and could make recommendations regarding apportionment of revenue between the different departments, services and works of the Government.

Much effort could be saved thru the organization of administrative boards or commissions of experts in aid of Congress. The impression seems to prevail among many legislators that the organization of such boards involves the abdication or delegation of legislative power. The Interstate Commerce Commission is a powerful argument to the contrary. Doubtless the power to fix rates is a legislative power, but Congress, instead of exercising this power directly, acted wisely in organizing an administrative commission and fixing the rules under which this power should be exercised. This policy might well be extended in the organization of administrative boards for the continuous and systematic consideration of questions relating to the tariff, the trusts, the improvement of rivers, the construction of public buildings and the adjustment of such questions under rules fixt by Congress.

The Trusts.—As to the trusts, it is difficult to say what will be done so far as additional legislation is concerned. The system of enforcing the Sherman law regarding interstate trade thru the Attorney-General's office, with its shifting incumbencies and varying policies, has not been satisfactory, as compared to that of the Interstate Commerce Commission in enforcing the laws regarding interstate transportation; and these experiences, it seems to me, constitute a controlling reason for organizing an independent Interstate Trade Commission, which, regardless of political exigencies or executive or political influence, will insure the steady and continuous enforcement of the laws relating to trusts and monopolies. It is to be hoped, therefore, that Congress will supplement the Sherman act by the organization of a nonpartisan independent Interstate Trade Commission, with powers of investigation, publicity and recommendation to the President and to Congress, and also

with the power to aid the courts in the disintegration of monopolistic combinations, and to act, independently of the Attorney-General's office, upon complaint or its own initiative, in investigations with a view to bringing such combinations to justice where they fail to conform to the law. Such a commission would be entirely different from the one suggested by Messrs. Gary and Perkins. It would not regulate monopolistic combinations or fix their prices, but would either break them up or bring them into harmony with the law. Its work would be continuous, non-partisan, uncontrolled by political emergencies, and would not be subject to the influences which from time to time have controlled the Attorney-General's office in all administrations.

To existing legislation there will doubtless be added, as required by the Democratic platform, the declaration by law of the conditions upon which corporations shall be permitted to engage in interstate trade, including, among others, the prevention of holding companies, of interlocking directors, of stock watering, and the control by one corporation of so large a proportion of any industry as to make it a menace to competitive conditions. It would be advisable to entrust the enforcement of these conditions to the Trade Commission above referred to.

Banking and Finance.—The Republican party is practically committed to a central banking and reserve association, organized after the analogies of England, France and Germany. The party is apparently oblivious of the fact that in the near future many of our forty-eight States will equal in population each of the countries referred to.

The plan of the National Monetary Commission, headed by Mr. Aldrich, makes the nation the basic unit, and provides for branch associations, regardless of State lines. The Democratic party in its platform has declared against the Aldrich plan, but fails to outline any specific legislation. It would seem advisable that the Democratic plan should take the States as the basic units for organization, and then federate the State organizations for national action. All that is desirable in the plan of the National Monetary Commission can be secured by the organization, under national law, of a reserve association in each State, composed of both national and State banks, for the purpose of protecting their reserves and co-operating in the prevention of bank panics. Such State reserve associations could be brought into federation under national law by some form of national organization which would bring the various State reserve associations into co-operation for the prevention of bank panics and the interruption of interstate exchange. The States should be encouraged to exercise their functions—not to turn them over to the National Government.

Commerce may be divided into three branches: trade, banking exchange and transportation. The jurisdiction over that part of such commerce which is included within the boundaries of a State belongs to the State; the jurisdiction over that part of such commerce which exists between the States or a foreign nation belongs to the nation. It is, therefore, incumbent that we should have State regulation as well as national regulation of trade, banking exchange and transportation. We have worked this out admirably regarding transportation by the organization of a National Railroad Commission and State railroad commissions, which every day are coming into closer co-operation and harmony with each other. There is no reason why we should not similarly organize both State and national commissions for the regulation of banking exchange and trade, the State commissions to have jurisdiction over that portion which is embraced within the States and the national commissions to have jurisdiction over that portion which is between the States and with foreign countries. Instead of breaking down our whole scheme of government by permitting the greater sovereign to absorb and exercise the functions of the lesser sovereign, the true theory should be to insure the exercise of the functions of all the sovereigns under a system of co-operation that will insure harmony instead of discord.

The Military Defense.—Under Democratic administration I have no doubt that high efficiency will be sought in our military defense. The idea is growing that the military defense should be re-

garded as a unit by uniting the navy and army in co-operation thru a board consisting of distinguished army and navy officers, which board should be advisory to the President and to Congress.

We could also aid in the establishment of an efficient militia in the various States thru the co-operation of our army, thus securing a discipline and drill that will develop a citizen soldiery able at any time to respond to the demands of war.

The importance of having officers trained in drill, sanitation and care of troops, to take direction of the citizen soldiery in case of war, has been demonstrated, and an increase in the military school at West Point with a view to meeting such requirements might well be made. The graduates beyond those actually required for officering the regular troops should be utilized, thru some co-operative system, in training the militia of the various States.

Our platform calls for a well-proportioned navy. Such a navy should consist not only of fighting ships, but of the auxiliary ships necessary to aid in fighting ships in time of war. Such auxiliary ships could be used in time of peace as training schools for the naval reserves and in opening up new routes of foreign commerce under arrangements with shipping companies.

The Public Domain.—The nation under Democratic administration will be regarded as the trustee of the public domain, holding the great natural resources in lands, water, timber and minerals as trustee for the interests of the people of the respective States in which they are located. Democracy will guard these natural resources against combination and monopoly, but will also see that they are not withheld from development or too long exempted from contribution to the revenues of the States within which they are situated.

The rapidly approaching exhaustion of the public domain and the increasing difficulty which would-be settlers on the land find in securing homes have created a condition which would seem to make it the duty of the nation to take charge of the settlement of people on such lands. It is to be hoped that a homestead service will be created, with appropriate officials and machinery, for aiding settlers in finding homes on the land, instructing them how to make a living from it, and making the remainder of the national domain available to the people on conditions favorable to settlement and cultivation.

The Civil Service.—The spoils system has been largely done away with in public service. The Democratic party is committed to the completion of this work and to such organization of the civil service as will insure certainty of tenure, based upon merit and efficiency. Outside the army and navy the National Government has about 250,000 employees. The nation should be a model employer, and all the reforms relating to the relations of employer and employee which an intelligent public sentiment has forced upon corporate employers should, so far as applicable, be applied to the civil service.

Public Works.—Under Democratic administration the merit system, which has proved so effective in promoting the efficiency of the civil service, will be extended to projects and works. The practices under which the apportionment of river and harbor improvements and public buildings are made dependent upon log-rolling rather than upon merit will be done away with. The platform calls for large and comprehensive plans for the development of our rivers in co-operation with the States and for continuous work, with an ample fund, under the direction of a board of experts in engineering and construction.

The platform and the trend of public opinion indicate that the nation will take up the question of the regulation of the flow of our rivers in a most effective way, supplementing bank and levee protection below by the diversion and storage of flood waters above, and putting these flood waters to useful work in aid of the reclamation of arid and swamp lands and of water power development.

Investigations have been had by the Democratic committees of the House regarding the construction of our public buildings, and doubtless a systematic scheme will be presented embracing the organization of a Bureau of Public Buildings, which will take them out of the spoils system and apply the test of adaptability to locality and use, based upon public necessity. Our public buildings should be memorials of the culture of our

time, and in every form of construction regard should be had for art as well as utility. The National Commission of Arts, recently created, will probably be brought into co-operation with this bureau as an advisory organization, with a view to securing a proper system of artistic construction.

All these public works should be conducted continuously thru the creation of funds in the treasury for that purpose, and without the breaks in construction heretofore experienced thru political change and financial exigency.

It is possible that all these constructive works will require an expenditure of from fifty to one hundred million dollars more annually than has heretofore been expended for these purposes. If the funds cannot be secured by administrative economy, it may be advisable to levy a graduated inheritance tax for such purpose, such tax being now available without constitutional amendment. If so it would be wise to place the proceeds of this tax in a special fund for constructive work. The objection that the States are now imposing this tax can be met by providing that a reduction, not exceeding one-half, may be made in States deriving a portion of their revenue from inheritance taxes. Such a provision would have a tendency to produce uniform inheritance taxes thruout the States, and to prevent certain States from offering refuge to the wealthy from the imposition of so just a tax.

Social Justice.—The Democracy can be relied upon, so far as the national powers will permit, to seriously consider the questions which of late years have so engrossed the public mind relating to social justice, including all questions relating to the withdrawal of privilege, to the imposition upon wealth of a fair proportion of public burdens, and to the just obligations of collective capital to collective labor. It has already favored liberal legislation upon these lines in matters relating to the employees of carriers engaged in interstate transportation, and doubtless it will extend the same to the large body of civil service employees in its relation with whom public opinion demands that the Government should set an example of justice and humanity to all other employers.

The United States should extend its system of education in agriculture and the industrial arts to all forms of useful vocations by a system of co-operation in the establishment of schools which will serve as models for vocational training.

Much can be done to add to the comfort and happiness of the people by accurate and scientific investigation of all the problems relating to the advancement of farming, the development of educational and social facilities in connection with farm life, good roads, good housing and good housekeeping, the planning of cities with a view to the general comfort, health and recreation, the democratization of art, and many other problems that relate to social advancement. While these matters are more directly within the province of the home government of the States, much can be done in a co-operative way by the nation. The Agricultural Department, whose expenditures have been more directly beneficial to the people than those of any other department, furnishes an example of what can be done in a national way by co-operation of the nation with the States. Washington should be the clearing house of the various State associations, organizations and instrumentalities designed for social advancement and the solution of great constructive policies. The National Government should not attempt to absorb in any degree the functions of the States. Its aim should be to so interlock its activities with those of the States as to stimulate the exercise of local functions. The opportunity is offered to a constructive Democracy, thru the co-operation of the nation with the States, to put in legislation all that is desirable in collectivism without impairing the sturdy individualism upon which our institutions rest.

The advanced position which Woodrow Wilson has taken upon all these questions during his administration of the gubernatorial office in New Jersey and the marked favor with which his record has been endorsed by the Democracy of the country indicate that Congress will cheerfully supplement his efforts for the promotion of social justice.

RENO, NEV.

The Country Store: An Opportunity

BY FRANK FARRINGTON

A BUSINESS opportunity, that is being overlooked by many men who are fitted to it and wondering what they can do, is the country store. By this is meant the real country store, the general store out in the village of 500 people or less, or at the crossroads where there is no village at all.

To the man who has grown up with the idea in mind that a store will succeed only where it is surrounded by a large population of prosperous householders, this store at the crossroads does not look like a desirable proposition. It looks like a violation of all the laws of business to expect to attract a profitable trade where there is scarcely any trade in sight.

And yet there are thousands of these country stores thruout the United States doing a gross business of from $10,000 to $50,000 each, and in some instances a great deal more.

Usually this general store has the post office, and that perhaps pays the rent, tho the receipts are rather small. The little village or community in the vicinity of the store may have fifty people or five hundred and fifty, but the bulk of the trade comes from the farmers within driving distance.

There may be two stores in competition with one another in such a locality, but when this is the case it is usually found that one of them is practically dead while the other is getting the business.

In a trip of some twelve hundred miles recently taken by the writer, mainly for the purpose of calling upon country storekeepers and getting in closer touch with them, it has been demonstrated that their success is rather remarkable. A large proportion of them own automobiles. Nearly all of them own their own homes or stores. They are alert, intelligent business men.

Perhaps their stores lack modern fixtures. They have not the conspicuous show windows of the city stores, because

CROSSROADS STORES ARE THE SOCIAL AND BUSINESS CENTERS OF THE SURROUNDING FARMING SECTION. THIS IS THE GROCERY AT OASIS, UTAH

A TYPICAL FOUR-CORNERS LOCATION AT HASTINGS, N. Y.

there are no pedestrians passing in large numbers who would look into those windows. Still, they do have much modern equipment and they do make good use of such windows as they have—at least, some of them do. The most progressive are adopting many city methods, tho they adopt them in modified form adapted to their surroundings.

Cash receipts of $35,000 are not at all uncommon in these country stores in a village of perhaps one hundred and fifty, where there may be two or three other stores to share the local trade. And a business of that size ought, if managed properly, to return to the owner 10 per cent. of the receipts as net profit over and above his own salary. Probably few do

WHERE ONE MAN HAS MADE GOOD IN A SMALL MASSACHUSETTS VILLAGE

return as much as that, but if a can can get a good salary for himself out of the business and $1,000 or $2,000 each year to put away in the bank, he is doing better than most of his city brothers in trade.

The expenses of the country store are much lighter than those of the city store. Rent is comparatively a negligible quantity. Employees' wages are low. Personal expenses are less. And almost invariably better retail prices, higher profits, are obtained.

For the young man entering the retail mercantile business the city is usually the great magnet. He is drawn toward the great white lights of the busiest sections of the business towns. It seems to him that the place to go to develop business for himself and to get rich is where there is the most business and the greatest riches.

While it is obvious that there is more business in the city, it is also obvious that there are more people after it there, and the number of mercantile successes is limited to a small 10 per cent.

It takes a good business man to succeed at the crossroads as well as in the city, but out there he has more time to think; he is opposed to minds that are perhaps less keen. The personal element counts for more and there is less of the inclination to stick to the mere "business is business" basis.

There are opportunites in the country store for countless men who have found that in the city they can get no farther than the job behind the counter.

The man with a few hundred dollars saved who is willing to turn his back upon the city and start in at the crossroads as the village storekeeper can become his own business man and a citizen of importance in his community, and if he has the elements of a good merchant he can live his life in well-to-do peace among friends and neighbors who will like and respect him.

Modern methods will win business at the crossroads as well as in the city; perhaps better. The farmers are reading the best papers and magazines. They are traveling enough, so that they know what is what in the way of modern stores. They appreciate the efforts of their local merchant to keep up to the times.

WHERE ONE MAN HAS MADE GOOD IN A SMALL NEW YORK STATE VILLAGE WITH PLENTY OF COMPETITION

SOUTHERN OPPORTUNITIES FOR YOUNG MEN WHO CAN HANDLE COUNTRY TRADE ARE MANY AND UNDEVELOPED

They can be reached with good advertising. If there is a local newspaper, space in that will get their attention. If there is none, then there is no better way for the country merchant to reach them than by issuing a little newspaper of his own for the store. A store paper with news items and jokes scattered among the advertisements will get the standing among the farmers of a local newspaper when there is no other.

It is of course important for the village merchant to make friends as fast as possible. He should extend his list of acquaintances until he is on friendly terms with everybody that he meets. He should be enough of a politician to be able to remember names and faces, and to think to ask the babies' ages, and to inquire about the crops. The personal element goes farther with the farmers than with any other class of trade, and a farmer will stick more closely to the merchant he likes and he will do more to bring other trade to him than any customer of a city store.

Opportunities in the form of country stores now poorly conducted or of locations where there is now no store are waiting for live young men who know how to buy and sell, or who can learn, and who appreciate the country people and realize their intelligence and their advancement.

The small amount of capital necessary for embarking in the country store business is an important item in making the opportunity one that is open to many who might never be in a position to take advantage of a city retail store opportunity.

Country merchants who have grown to a remarkable success have started business in the front room of their home at the crossroads, or in a room rented in the front part of a village hotel. They have built little slab shacks with a loading platform in front and a hundred dollars' worth of goods inside. They have started with a wagon on the road and only a woodshed storehouse at home, or they have walked out at first with a pack on their back.

There must first be a willingness to begin at the bottom, and next an ambition to get to the top. When any young man has those two qualifications he is very likely to make good with his country store.

The South is particularly prolific in such retail business opportunities. The storekeepers in the smaller villages and even in many of the larger ones are doing business in an antiquated, not to say in a

slovenly manner, and when one live young man opens a store of the clean, modern sort in competition with such others, he speedily gets the best trade and the cash trade.

One young man from the North went into the South five years ago, and, after a year or so of service as a clerk, he took the three hundred dollars he had saved, and, borrowing enough to make it a thousand, he opened a store of his own, and in the short time remaining he has become worth some twenty thousand dollars. Of course, this is a very exceptional instance, but it is a real one, and exceptional instances do occur when there is an exceptional man back of the opportunity.

A good way to get in touch with such business opportunities is to take a little trip thru the country districts afoot or with a horse or a bicycle, visiting with the storekeepers and farmers by the way. Particular attention should be paid to locations near large, well-established creameries, or on the roads to railroad stations where such produce is shipped.

DELHI, N. Y.

The Negro and Illiteracy

BY BOOKER T. WASHINGTON, LL.D.

PRINCIPAL OF TUSKEGEE INSTITUTE.

PERHAPS the most important single fact which the census has brought to light in regard to the negro in America is contained in the figures which show the progress of the race during the last ten years in learning to read and write. At no period in their history has so large a proportion of the negro people succeeded in gaining the sort of freedom that comes with the opportunity to live by and with the printed page.

There seems to be a pretty general agreement among people thruout the world that the black man, at the time of his emancipation, was, so far as education was concerned, at the bottom. Forty-eight years ago, when Abraham Lincoln made us free, there were, perhaps, 3, certainly not more than 5, per cent. of the freedmen who were not wholly illiterate. The census figures just published show that at the present time 69.5, practically 70 per cent., of the colored people of the United States can both read and write. In 1900 there was still 44.5 per cent. of the negro population of the country who were illiterate; now there remains only a little more than 30 per cent.

Compared with the American white man, both in the Northern and the Southern States, the negro, not only in respect to general education, but in his ability to read and write, is still far behind. The figures show that in 1900, 6.2 per cent. of the white people in the United States were still unable to read and write. In 1910 this percentage was reduced to 5. In the Southern States the illiteracy among the white race has been reduced from 11 per cent. in 1900 to 8 per cent. in 1910. Still more interesting are the figures for the immigrant white population. Among the foreign whites the number which could neither read nor write was in 1900 12.9 per cent., and in 1910 12.8 per cent. These figures indicate that, while the native white population has decreased its illiteracy 1.6 and the foreign white population has decreased its illiteracy only about one-tenth of 1 per cent., the illiteracy among the negro population has decreased 14 per cent.

The significance of these figures will appear, however, when they are compared with statistics showing the conditions among people in other parts of the world in somewhat the same stage of development as the black man in America. In Cuba, for example, 59 per cent. of the people cannot read and write; in Spain, 68 per cent.; in Russia, 77 per cent.; in Portugal, 79 per cent.; in Brazil, 80 per cent. Within forty-eight years the American negro has reduced his illiteracy by 67 per cent. It should be noticed, too, that the people named above are not aliens in their country.

One of the most interesting facts

brought out by these figures is that the negro seems to be making greater progress in those parts of the country where he has less opportunities than in other parts of the country where he has greater opportunities. For example, illiteracy among the colored people in Delaware decreased 12.5 per cent. in the years between 1900 and 1910. In Maryland the decrease was 11.7; in West Virginia, 12 per cent.; in Kentucky, 12 per cent. In the District of Columbia, where negroes have perhaps the best public school facilities of any place in the world, the illiteracy of the race decreased 10.8 per cent. In the following four Southern States, where the public school facilities are, as a rule, poor, it appears that so far as the mere matter of learning to read and write is concerned, negroes are making more rapid progress than in any other part of the country. For example, the decrease in illiteracy between the years 1900 and 1910 was 15.7 per cent. in North Carolina; 15.19 per cent. in Georgia; 16.6 per cent. in Arkansas, and 17.3 per cent. in Alabama.

I do not mean to say that this is an entirely fair comparison, but it does show that the one way to inspire the negro with an ambition and a determination to get an education is to let him know that some one in the community is opposed to letting him have it.

It is a great thing for the people who have been slaves to have gained possession for themselves, in so short a time, of one of the fundamental tools of civilization. We should not, however, be deceived by figures which indicate that a little more than two-thirds of the negro population are able to read and write. Races, like individuals, may be able to read and write and be little better off than they were before, so far as concerns the fundamental things of life. Few people understand the enormous handicap under which the negro labors in his efforts to get an education of any kind, and few people also appreciate the sacrifices which the progress thus far made has cost the masses of the negro people. I do not believe that the best white people of the South realize how little of the school funds, which is supposed to be distributed equally among the races according to the number of children of school age, ever reaches the negro schools, and I am sure they do not realize to what extent the money which is actually expended upon negro education in many parts of the South is wasted.

In Elizabeth City County, Virginia, for example, there are 2,200 white children of school age and 2,300 colored children of school age. These negro children have had twenty teachers to give them instruction during the past year, while the white children have had forty-nine teachers. The negro children have had school buildings costing $5,000, while the white children have had school buildings which cost $62,000. The salaries of the twenty negro teachers amounted to $4,000, while the salaries of the forty-nine white teachers amounted to $23,000.

Much has been said from time to time about the schools in the South for the higher education of the negro. Few people either in the North or the South realize, however, to what extent these institutions, which are supposed to be for the higher education of the negro race, are merely doing the work which should be done by the public schools. Of 189 schools of which we have statistics, in which negroes are supposed to get higher education, nearly 57 per cent. of the pupils are in the elementary grades and only 5 per cent. are getting what is commonly called a college education.

Not only is the negro not getting a college education to any such extent as most people believe, but in too many cases he is not getting anything in the schools that is worthy of the name of education. I can best give an idea of the conditions that prevail in some parts of the South in the words of one of the recent reports made by the Superintendent of Schools for South Carolina.

In his last annual report the State Superintendent of Education in that State speaks thus concerning the deplorable condition of the negro public schools:

"The education of the negro in South Carolina is in the hands of the white race. The white trustees apportion the funds, select the teachers and receive the reports. The county superintendent has the supervision of these schools in his hands. We have expended this year $348,834.60 in the support of negro

schools. I never visit one of these schools without feeling that we are wasting a large part of this money and are neglecting a great opportunity. The negro school houses are miserable beyond all description. They are usually without comfort, equipment, proper lighting or sanitation. Nearly all of the negroes of school age in the district are crowded into these miserable structures during the short time which the school runs. Most of the teachers are absolutely untrained and have been given certificates by the county board not because they have passed the examination, but because it is necessary to have some kind of a negro teacher. Among the negro rural schools which I have visited, I have found only one in which the highest class knew the multiplication table. In South Carolina we have simply turned over a portion of the school fund to the negro schools, and expect the most ignorant teachers of the State, without any suggestion or directions, to adapt to the special needs of the negro schools a course of study and text books designed primarily for the white children.

"The negro tenant is now, and will be for years to come, the tenant farmer of South Carolina. His welfare and the prosperity of the white race depend largely upon his efficiency as a farmer. I believe that the time has now come for us to attack the negro school problem with a serious intention of adapting the schools to the special needs of the negro farmer in an endeavor to teach him agriculture, to encourage manual training, cooking, sewing, personal cleanliness and hygienic conditions in his home, along with the elements of a common school education. The schools should endeavor to set for him a better standard of living, and increase those ever-present and insistent wants which enter about a well-kept home, and thus secure for him a better existence and for the land owner a more constant labor supply. This problem has not yet been solved, and the "well done" of the whole South awaits the county superintendent and trustees who will attack it vigorously."

Notwithstanding these difficulties, the negro, as the census figures I have quoted show, is making progress. He is learning, like the Jew, to make education a part of his religion. More and more every year the schoolhouse is taking its place alongside of his church as the center of thought and interest.

Every year the amount of money contributed by the negro to his own education thru churches and other organizations grows larger. A fair estimate makes the sum of these contributions by negroes to negro education since emancipation not less than fifty million dollars. There is to my mind no better evidence of the fact that the money which has been put into negro education in the South has, in spite of all the deficiencies of the negro schools, been well invested than the fact that thru this education the negro is learning to help himself.

There has been and there still is prejudice against negro education in the South, but every year the number of thinking men in the Southern States who realize that the only practical solution of the negro problem of the South is the education of the negro race is increasing.

Let me add in conclusion that, in my opinion, there is at the present time no place in this country where money could be invested to such advantage as in assisting the members of both races in the South who are seeking to inspire and direct the movement, which has already begun to build up, not a single school here and there or a single college, but a practical, adequate and efficient system of negro education in the Southern States.

TUSKEGEE, ALABAMA.

Genesis

BY ARTHUR WALLACE PEACH

OUT of the silence, song;
Out of the bud, a rose;
Out of the rose, the scent
The wood-wind blows.

Out of the years, a faith;
Out of life's travail, truth;
Out of the heart, the charm
Of ageless youth.

Out of the things unseen,
Out of the inner dream,
Ever in beauty is born
The love supreme!

BRATTLEBORO, VT.

The First Japanese Polar Expedition

BY LIEUTENANT SHIRASE

[What the Japanese expedition to the Antarctic Continent was able to do, under meager support, but with indomitable courage, is told by its leader in the following article.—EDITOR.]

"LET the stalwart John Bulls or wealthy sons of Uncle Sam attack either pole if they want to, but we should let the South Pole alone. First, we don't have the money, and, second, adventurous exploration isn't exactly in our line." If these were not the exact words, it was the sentiment that the Japanese Government exprest to me, when I applied for a fund for my proposed dash for the South Pole. The dictum of the Government was in fact an expression of the opinion then widely held among my countrymen. But now the Government and my countrymen think differently and better of their own qualification as explorers, and those who contributed money to our cause in the belief that they were throwing it away for nothing are convinced that our expedition to the Antarctic regions was not after all mere wasting of time and money. To summarize our journey: we left the country out of favor of the people and were welcomed back into public favor and recognition.

In 1912 I requested 100,000 yen ($50,000) from the Diet as a fund for my prospective polar expedition. The bill was past by the Lower House, but it was reduced to $15,000 at the Upper House. Whereon I applied to the Educational Office for its financial assistance to what I believed would have much educational value. I then carefully explained that that sum of money would fit out our party with complete and efficient equipment. The Government officials simply laughed at my proposition and exprest their opinion in words similar to those above quoted. They said also that how a polar expedition could be launched out in any satisfactory manner with the absurdly small fund of $50,000 was beyond their understanding and positively refused to give any help to our cause. Lastly, they advised us to abandon our foolish notion and leave the pole to European explorers who have more money and far superior physique.

There was no use in tarrying with the Government. I might as well argue with dumb Buddhist idols as with Government officials. At any rate, it was certain that no money was coming from that quarter. As the last recourse, I applied to the public for its sympathy and support; and it responded. The press took it up with enthusiasm. One journal of Tokyo raised by itself $2,500. My proposition appealed particularly to the student class; they all willingly spared something out of their meager purses.

When the tide was turning our way, the Government intervened to retard us with its frequent officious meddling with our affairs. For one, it proposed to favor us with an old transport, provided we go to the cost of $50,000 for her repairs. The reason advanced for this offer was that we could not purchase a dependable vessel out of the fund we were to work with, and that the dismal failure of the attempt—which was the only possible result of half way and insufficient preparation—would only disgrace our country. The Government's offer was politely declined; we knew better. Instead, a sailing ship was purchased. She was christened "Kainan-maru" ("Southern Pioneer"), and was immediately fitted up for the polar voyage. Out of the raised fund, $10,000 was expended for the equipment of the ship, and $15,000 for scientific apparatus, general outfits and provisions. We believe the first polar expedition attempted by Japanese was the least expensive one as well as the smallest in history. The party was made up with twenty-

seven men, including two Ainus, and a pack of thirty Ainu dogs. The ship in which we made the voyage was the smallest vessel that has ever plowed the polar waters. The "Kainan-maru" was built of oak and her sides were only 2 feet high. She measured 100 feet by 25 feet, and displaced 204 tons. Beside schooner rigging, she was provided with an engine of 18 horse power. At last, toward the end of 1910, we were ready for departure for the South Pole.

Seeing that the foreign polar explorers spent tens of thousands of dollars for their preparation, our expedition seemed absurdly small in its scale. This indeed made them skeptical about our attempt. The learned classes of people thought our scientific apparatus was quite inadequate and our staff of scientists was incapable of carrying on accurate scientific work. The mercantile class regretted that they had given financial support to the work, which was surely to end in no profit or gain. In fact, all—except students—thought that if we managed to get as far as New Zealand in our little craft it would be a miraculous achievement. Indeed, our ship would soon have gone to the bottom but for the masterful seamanship of our Captain Nomura. It is little short of wonder that he steered the poorly protected vessel thru many storms and perils with which the polar seas abound, and completed a voyage of some 30,000 miles without one serious accident.

A POST TO MARK THE FARTHEST POINT REACHED

Thus, amid scornful criticisms and ominous predictions as to the outcome or fate of our voyage, the "Southern Pioneer" set sail from Tokyo Bay December 1, 1910. It was the saddest and most dismal sort of a send-off ever accorded to any polar explorer. Only a small crowd of students—who, however, made up for lack in number with their enthusiasm—were there to wish us *bon voyage* and best success. The scene of our departure from our native country remained ever fresh in our memory not to weaken, but to strengthen our determination. To be sure, we realized that our equipment was far from being as complete as might be wished; but we knew that what we had was sufficient for our purpose. Then we placed the most confidence in the best asset to our party—namely, the determination and courage of the crew.

On February 8 of the following year, seventy days after the departure, the "Southern Pioneer" arrived at Wellington, New Zealand. We were behind the time by many months for the dash for the pole. Our first plan was to start July 1, 1909, simultaneously with Captain Scott. However, we decided to push as far as it was possible to go. Meeting very rough seas between 55° and 60° south latitude, we safely reached Coulman Island on March 1. Sailing still southward, our journey was greatly impeded by the waters infested with threatening icebergs and icefloes. We hoped to make as far as Whales Inlet by way of McMurdo and Mt. Erebus, but, being helplessly late in the season, we had to abandon our hope and turn back to Sydney, to prepare for another voyage to the pole. Then we also decided to give up the idea of reaching the pole, as we realized that we were fatally handicapped by our delayed start in the competition with the foreign explorers, and to devote the second trip to geographical and scientific research in the Antarctic waters. When we arrived at Sydney May 1, Captain Nomura and several others were sent back to Japan to raise some more funds.

The remaining crew landed in Sydney. Tents were pitched in a private garden wherein to wait for the return of our captain. It was anxious waiting. Our fund was almost gone and provisions ran short daily. In the face of privation and threatening starvation, we lived almost a beggar's life.

The New Zealand press viewed our attempt with ridicule. The *New Zea-*

THE "KAINAN-MARU" (SOUTHERN PIONEER)

land Times was particularly poignant in its comment upon us. It remarked that we were a crew of gorillas sailing about in a miserable whaler, and that the polar regions were no place for such beasts of the forest as we. This zoological classification of us was perhaps to be taken figuratively, but many islanders interpreted it literally, for crowds of people came to our tents daily to observe the "sporty gorillas" misguided with the crazy notion of conquering the South Pole. The situation was embarrassing enough to us, tho we all appreciated the humor of it. It was not till after Professor David of the University of Sydney visited our camp that we were fully recognized as human beings and efficiently equipt with scientific apparatus. Thereafter we were enviable recipients of bouquets from many admiring maidens of the island.

Captain Nomura returned late in October of the following year with a fund. The "Southern Pioneer" sailed November 19, 1911, on her second voyage to the polar seas. It was then the middle of the polar summer. Between 63° and 64° S. we met icebergs, which increased steadily with the progress of the journey. In 66° S. the ship was confined to a standstill for days by icefloes and pack-ice thickly floating. The voyage became difficult to the extreme. Thanks to the seamanship of Captain Nomura, however, we arrived at a bay in 78° S. and 146° E., after hard sailing of many days. We named it "Kainan Bay." Finding it impossible to land there on account of tremendously huge glaciers, we drifted about 40 miles westward, where we chose to effect a landing. Later we discovered the "Fram" and near by Captain Amundsen's camp some six miles west of us. They were waiting for the return of Captain Amundsen from the Pole.

At the place we selected for landing an ice barrier 300 feet high and extending for many miles confronted us. The conquest of this icy wall was the only way of landing in the ice-land. It was indeed the feat found to be impossible by Ross, Shackleton, Scott and Amundsen. At the point where Captain Amundsen

第十一 日本探検隊船上ト捕獲セル「ペンギン」鳥ノ光景

THE CREW OF THE "KAINAN-MARU"

landed the ice barrier was only about 40 feet high, and yet he had to devote a month to its scaling. We were resolved to scale the so-called insurmountable barrier or die. We set to cutting a zig-zag path up on the almost perpendicular slope.

The whole crew worked body and soul, and at length, after sixty hours' hard labor, the first man was at the top of the wall or precipice. The crew of the "Fram," which had followed our attempt at first with ridicule, then gave us hearty praise of our achievement.

A party of four men, including myself, remained on the ice-field, while the rest sailed away to explore King Edward VII Land. This latter party was by far more fortunate and successful. A cruise of about 200 miles brought them safely to King Edward VII Land,—the land where the Japanese flag was the first to be unfurled.

Before their landing, they had an experience of particular interest. When the ship was brought near the icy shore, a rock was seen frozen in a pack-ice and drifting along the shore. The rock was hauled aboard and was brought back. We have the pride to announce that it is the first rock that has ever been brought back from that land.

A land exploring party was landed, which traveled 30 miles into the interior. There another important discovery was incidentally made. The men felt the ice-field, which had been supposed to be the continent of land, regularly undulating under their feet as on large swells of the sea. This naturally suggested to them the idea contrary to the long established hypothesis that King Edward VII Land is the Antarctic continent. Many photographs were taken, and many scientific data were gathered that might help to decide this great geographical question. The results of those series of scientific investigations, together with the rock, will be submitted to Cambridge University for the final verdict. At any rate, we feel fully compensated for the journey and hard experiences by our trifling contribution to science.

The rest of our voyage may be summarized in brief. The party reunited at Whales Inlet, and started homeward via Sydney. The "Southern Pioneer" returned to Tokyo on the 20th of last June. The people who sent us off with perfect ridicule and scorn came out in a body to give us spontaneous ovations and hearty welcome to home. Thousands of people were literally frantic in cheering their Antarctic explorers. To celebrate our return, a mammoth paper lantern procession paraded thru the streets of Tokyo on that evening.

日本探検突進隊上陸終點ニ於テ遥拜式擧行ノ光景

REPORTING TO THE EMPEROR THAT THEY ARE ABOUT TO START HOME
Lieutenant Shirase is the central figure

Such is a brief account of our Antarctic expedition. Many unexpected hitches and adverse circumstances attended our journey to impede its progress or to make its success impossible. Considering the situation we were placed in, however, we feel satisfied with the results. At least, by our accomplishment, we undeceived the general notion that $50,000 is not enough to conduct a polar expedition, providing there are masterful seamanship and dauntless courage to go with it. We also proved that the Japanese are as well qualified as Europeans, if not better, to attempt any exploration, and the fact that our people can stand cold with less clothing and stand labor on less diet gives them many advantages over Europeans. In the polar regions we were dressed as usually we are in the winter, with the only addition of fur-lined jackets and gloves. Aboard the ship our daily diet was about 38 ounces of bread, biscuits and canned stuffs, and when away from the ship our diet was reduced to half the usual amount. With that protection against the cold weather and on that diet the crew was always highly efficient and able to endure any kind of hard work. This fact justifies me in saying that the Japanese are highly qualified to withstand any hardship that can be endured by any people.

In conclusion, I wish to say that it is neither fair nor possible to estimate the benefit or the value of our late Antarctic exploration in mathematical figures. Many who tried to do so have severely criticized us. I, as well as the crew of the "Southern Pioneer," can afford to disregard those unfair and some even inimical comments and wait for universal verdict on this point. We believe that we have done the best that was possible in the circumstances. On the other hand, our polar expedition has kindled the latent fire in the hearts of the Japanese, and the spirit and love of adventure is already calling out many to thrilling experiences. Really I do not hesitate to say that were there another pole to be conquered, Japanese would be among the foremost in the dash, and that they would receive from the nation far more enthusiastic support than what was given to the brave crew of the "Southern Pioneer."

TOKYO, JAPAN.

Washington's Unique Compensation Law

BY HAMILTON HIGDAY

Member of Washington Industrial Insurance Commission.

THE battle for workmen's compensation in the United States has been won. An irresistible public opinion has rapidly crystallized, demanding that the old, unscientific, strife-breeding personal injury litigation between employer and employee shall cease; that it shall be replaced by a system whereby workmen in hazardous occupations shall receive prompt, certain and reasonable compensation wherever injured in course of employment, without regard to whose fault was the cause. Such laws have been passed in the States of Massachusetts, New York, New Hampshire, New Jersey, Ohio, Wisconsin, Illinois, Kansas, California, Montana, Washington, Michigan and Nevada, in response to the aroused public sentiment demanding that broken men shall be paid for by the consumer as a part of the price of the produce, exactly as he has heretofore paid for broken machinery, mistakes of managers and depreciation of plant. Investigating commissions in at least twenty-two States have been searching European experience and weighing constitutional limitations in the endeavor to obtain the best substitute for the "ambulance-chaser and claim agent regime," universally condemned. The new laws passed have been attacked, and upheld by the supreme courts of five States. In but one, New York, compulsory compensation has been held unconstitutional. In consequence of this reactionary opinion, not only do the working people of New York fail to reap a benefit from the painstaking work of the Wainwright Commission, appointed by Governor Hughes, but in fear of that decision, handed down March 24, 1911, most legislatures have enacted elective or pseudo-elective laws for workmen's compensation in place of the thorogoing statutes the people demanded.

The compulsory State insurance act of Washington, however, became law by the signature of Governor Hay ten days before the famous decision of the New York Court of Appeals, and on September 27, 1911, the Supreme Court of the State of Washington, refusing to follow the precedent of the highest court of the first State of the Union, declared that the Washington act violates no provision of either the State or the Federal constitutions.

The Washington law has been an undeniable success, exceeding the expectations of its friends and winning the enthusiastic support of the 5,000 employers under its operations and the 100,000 employees insured. During the first ten months of its administration, up to August 1, 1912, there was paid into the State's "Accident Fund" (in reality forty-seven distinct funds) the sum of $791,473.57. Of this sum $306,011.99 was paid out in cash awards on the 7,660 claims adjusted, with $197,132.69 additional set aside as reserves to guarantee pensions during the life of widows or for deceased workmen's children until they reach the age of sixteen. A total af 9,212 accidents were reported, and 1,552 on that date were still in process of investigation by the commission.

It is anticipated that not far from $1,000,000 will be paid out or reserved for widows during the initial twenty-two months, for which the Legislature appropriated $150,000 to cover the administration cost. Therefore, the law will cost the taxpayers 15 cents for each dollar paid the workman or his survivors if the entire administration fund be wholly expended in initiating the system. This sum of $6,800 per month will probably be offset by the saving in court machinery, and includes salaries and equipment of offices, railway fare and subsistence of traveling auditors and the three

commissioners, fees to medical examiners, and expenses of special agents investigating accidents, installation and maintenance of elaborate records, accounting processes, etc.

The *rate* of premium to be contributed by the employer was fixed by the Legislature, and on the "extra hazardous" industries compulsorily under the law varies from $1.50 per $100 of payroll in occupations such as printing, working in foodstuffs, etc., to $8 and $10 per $100 on erection of steel frame buildings and manufacture of dynamite, respectively. By mutual election between employer and employee, establishments not within the compulsory scope of the act may be insured at $1.35 for each $100 of payroll. Very important is the provision that while the rate of assessment on each employer's payroll was fixed by the Legislature, yet the number of monthly assessments in any year will vary with the need according to the judgment of the commission, but any shortage either for claims or pension reserves must be made up at the end of each year. The above sums in the "Accident Fund" were obtained on a preliminary three months' payroll. In many of the forty-seven classes the amount obtained on that first quarter's assessment will last several years. Even in Class 10, the stupendous lumber and logging industry, the 2½ per cent. rate mentioned by law will in practice probably not exceed 1.25 per cent. for the year. Casualty companies have usually charged 1½ per cent., altho making settlements on but 20 per cent. of the accidents and protecting employers usually only to the extent of $5,000.

The compensation to the widow or children of a workman killed in an industrial accident is a pension, respectively, $20 per month to the widow for life (or until remarriage), and $5 for each child until it arrives at age sixteen, but the maximum pension for each case must not exceed $35. Other compensation is according to schedules in the law, which for temporary total disablement must not exceed 60 per cent. of the workman's wage at the time of injury, with a maximum for single men of $30 per month, and for a workman with a wife, wife and child, wife and two or more children, $37.50, $45 and $52.50 per month, respectively. For permanent partial disability awards are made according to a carefully compiled surgical scale allowing $1,500 for loss of the major arm at or above the elbow, down to $25 for a little toe. These dismemberments and other permanent partial disabilities are paid for in lump sums in addition to the monthly award for time loss. And a workman totally disabled is pensioned like a widow.

It is not too much to say that this system, however inadequate it may appear to theorists, could not be repealed in the State of Washington at the present time. If the pension compensation or monthly awards made be, as charged, in effect, only "a State regulated poor relief," nevertheless injured workmen are receiving on an average so much more than under the old system that it receives their practically unanimous approval. The working people clearly realize that, under the present system, where some few may have obtained heavy damages, the vast majority of workmen were left as charges upon society or to bear their burden alone with the best courage their crippled condition permitted, eighty out of each one hundred injured heretofore having no legal right to damages whatever.

That similar views are entertained in other States is evidenced from the New York State Federation of Labor proposing a State insurance fund in the Bayne-Sullivan bill, a bill which called out the lawyer-lobbyists and fighting reserves of the casualty companies, who recognize that the principle embodied in that bill, the Washington law and the Ohio act, dispenses with their services as middlemen between master and injured servant.

"The Workmen's Compensation Service and Information Bureau," comprising companies writing about 90 per cent. of the employers' liability insurance of the United States, is distributing broadcast thruout the Union a carefully prepared circular apparently primarily designed to discourage the extension of the principle of State insurance, and which teems with half-truths such as the following: "All State insurance plans thus far devised provide no adequate re-

serve for future obligations, and, therefore, create a constantly increasing charge upon new industries and upon those to whom the existing industries will pass by inheritance or other method of acquisition." The Washington State system, on the contrary, requires the industries of today to provide for the accidents of today; $4,000 is required to be set aside to guarantee the pensions of a widow of thirty, and lesser sums for more advanced ages computed according to the American Mortality Table of Life Expectancy. Should the widow remarry, the reserve in her case reverts to the fund of the particular employers' class; should she outlive her expectancy, the pension, of course, continues. Claims must be filed within one year; hence reserves for claims to be paid after a long history of litigation and appeals has no place in the Washington system, and it is not true that "policyholders would be assessed and assessed and assessed again to pay those old claims."

With alternating rate wars and brokers' agreements, with commissions to solicitors so high that the Insurance Commissioner of New York proposes limitation by the State, with an experience covering only 20 per cent. of industrial accidents and no actuarial knowledge of the remarriage rate of widows, casualty experience would seem to be as unscientific as railroad rates were until recently.

In Washington employers are grouped in classes sufficiently large to generally give effect to the insurance principle of distribution of risk. Accurate accounting will reveal the actual hazard of each plant. Power resides in the commission to increase the rate of any plant found unduly hazardous in comparison with other establishments of the class, and the next Legislature will undoubtedly add powers to require efficient safety conditions in addition to the levying of a penal rate to compel accident prevention. This, coupled with publicity of plant accident experience and competitors' comparisons, must tend to accident prevention to a high degree. One small class-fund is exhausted and State warrants are now payable by the employer in whose establishment the accident occurred, because the Powder Trust defies the State and refuses to pay into the fund with its few small competitors until the Supreme Court of the United States has passed upon the Washington law.

The people of Washington appreciate the fight of the casualty companies to retain their place in the social system, but deny that State insurance is not adapted to American conditions or is "essentially a charity," any more than requiring an employer free from fault to compensate his injured workman thru the agency of a private casualty corporation. If the system be socialistic, so are the schools, the post office, the Panama Canal and many operations of Government, State and national, under the general welfare clause. Self-respect, equality of opportunity to the individual, efficiency, good will between employer and men, encouragement of enterprise—State insurance conflicts with none of these. The lawmakers, the employers, employees and taxpayers of Washington believe that this pioneer compulsory State compensation law is a demonstrated success, accomplishing the following desired results:

1. Furnishes certain, prompt and reasonable compensation to the victims of work accidents and their dependents, eighty per cent. of whom have heretofore had no right to redress under common law rules.
2. Frees the courts from the delay, cost and criticism incident to the great mass of personal injury litigation heretofore burdening them.
3. Relieves public and private charity of much of the destitution due to uncompensated industrial accidents.
4. Eliminates economic waste in the payments to unnecessary lawyers, witnesses and casualty corporations and the expense and time loss due to trials and appeals.
5. Provides a method whereby one hundred cents shall go to the injured workman out of every dollar paid out by the employer for that purpose, premium rates automatically adjusted to actual cost.
6. Supplants concealment of fault in accidents by a spirit of frank study of causes; resulting in good will between employer and operative, lessening the number of preventable accidents, and reducing the cost and suffering thereby.
7. Home rule of compensation funds, same being invested in bonds of Washington municipalities, etc., instead of being drained out of the State by premium remittances to Eastern financial centers.
8. Publicity and State control of statistical information and education in accident prevention.

OLYMPIA, WASH.

How Industrial Peace Has Been Brought About in the Clothing Trade

BY GERTRUDE BARNUM

[Miss Barnum has been for many years high in the councils of the Woman's Trade Union League, and has had wide experience in organizing women workers and in promoting the welfare of the workers.—EDITOR.]

IN the midst of the din of tumultuous conflict in present-day industrial warfare one has to listen very closely for the still small voice which now and again, and here and there, whispers a promise of peace.

Such a promise is embodied in a plan which is being laboriously worked out by a body of courageous, intelligent manufacturers and labor leaders of the cloak and suit trade of New York City.

The "protocol of peace" signed by these manufacturers and labor leaders in September, 1910, has already been discussed to some extent and highly commended from press and pulpit and platform.

It may not be out of place, however, to review briefly its inception and content.

The ladies' cloak and suit industry of New York is carried on in about 2,000 separate establishments, in which nearly 50,000 people are employed. It represents a capitalization of $40,000,000, and the value of the output approximates $250,000,000 annually. In this important trade for twenty-five years labor conditions have been chaotic and industrial disputes unceasing. All the familiar horrors of the sweatshops stalked thru the East Side shops; and even in the supposedly exemplary Fifth avenue region the less obvious, but no less destructive, tension of the subcontract or subdivision systems wrought its ghastly chain of human wreckage. Humane employers were crippled by competition with the most unscrupulous when they sought to establish better standards. The other side of the picture was no more cheering. Undisciplined, badly led groups of suspicious foreign workmen, bitterly remembering persecution in the old country, and filled with the spirit of class-conscious revolutionists, pursued a guerrilla warfare against the "bosses," bickered, harangued and "struck," in season and out, with the conviction that wherever they thwarted the "capitalist class" they contributed to the movement toward a co-operative commonwealth. The entire trade was in a state of anarchy, "a free fight for all and devil take the hindmost."

At length, during a general strike of cloakmakers in July, 1910, Mr. Louis Brandeis, the famous Boston attorney, succeeded in bringing together, at a round table conference, ten leading manufacturers and ten labor leaders representing, respectively, the Cloak and Suit Manufacturers' Association and the International Ladies' Garment Workers' Union. The result of this, and a series of later conferences, was the adoption on September 10, 1910, of the now famous "protocol of peace," which provides, among other things, for a "preferential" shop (not a closed shop), union hours and prices, lower and higher "courts," for the adjudication of industrial disputes, and a joint board of sanitary control. After a year's trial of the protocol, labor leaders and manufacturers met once more at a round table, this time for a banquet, where cordial congratulations and renewed pledges were exchanged.

Mr. Brandeis has declared the protocol agreement to be "the most creditable and hopeful effort yet made in America to solve the problem of the proper relations of employer and employee." Mr. Hamilton Holt has coupled it with the peace treaties of President Taft, as indicating that "the time is not far distant when both industries and nations will be governed by law, rather than by brute force." And from the manufacturers' journal, *The Cloak and Suit Review*, September, 1911, we quote the following extract:

CHILD WORKERS WHO NEED "PROTOCOL" ARBITRATION COURTS

"The protocol must be pronounced a success. It has proven a workable instrument of industrial peace. To those who look upon business as more than mere barter and money making, who consider it a form of social service, the spectacle of a board of directors of a business organization giving their valuable time and energy to safeguard the high standard of an industry, and at the same time to deal equitably with organized labor, is worthy of the highest admiration."

It is no less wonderful to see ill-paid labor leaders often suspected, frequently criticised and abused by their own people, toiling day and night to train and discipline an intractable mass. But, above all, it is awe inspiring to watch a heterogeneous multitude of 50,000 men and women, an immigrant population, of diverse creeds and nationalities, slowly and painfully learning the lesson of subordinating the individual self for the common good; curbing passion; submitting to reason; learning to value organization; practising scrutiny of the actions of the leaders; and endeavoring to choose wisely its spokesmen.

"Any one who in any capacity, directly or indirectly, is working for the permanency of the protocol, is serving his country."

As has been stated, the New York protocol, besides insuring union wages and hours, provides for the arbitration of grievances.

A grievance board, consisting of five representatives of the manufacturers and five of the union, meets weekly and proceeds with a formal calendar of cases like any civil court. If disputes are not settled here, an appeal is allowed to a permanent court of arbitration, consisting of Mr. Louis Brandeis, chairman, and Mr. Hamilton Holt, nominated by the manufacturers, and Mr. Morris Hillquit, nominated by the union.

The protocol further provides for a joint board of sanitary control, made up of representatives of the three partners in industry—employer, employed and the public. The official recognition of representatives of the public on that board to safeguard consumers from tuberculosis and other germs which lurk in insanitary garments, is perhaps the most unique feature of this unique in-

strument for industrial democracy. It is the first attempt in the history of industry of this or other countries to control its own sanitary destiny. And the selection of Mr. William J. Schieffelin, president of the Citizens' Union; Miss Lillian D. Wald, of the Nurses' Settlement, and Dr. Henry Moskowitz, of the Ethical Society, as the public's representatives, gave promise which the first year's results fulfilled to a considerable extent.

The most startling evil disclosed by them in the first annual report was carelessness in regard to fire protection. In spite of the fact that the law required all doors in factory buildings to open outward, the inspection in February, 1911, showed that in 1,243 shops visited there were only 18 doors which did not open inward; and in August, 1911, five months after the tragic Triangle fire, 1,290 shops out of 1,750 visited, were still violating the law. The board is enlisting public support for better fire protection legislation and better enforcement of law, besides its educational work, with employers and employees in cloak and suit factories.

At the end of the first year every basement shop had been abolished, and before receiving a "sanitary certificate" from the board, factories must comply with the following, among many other sanitary and fire protection conditions:

1. No shop to be allowed in a cellar.

2. No shop to be allowed in rear houses or attic floors without special permission of the board.

17. At least 400 cubic feet of space, exclusive of bulky furniture and materials, should be provided for every person within the shop.

18. The shop should be thoroly aired before and after work hours, and during lunch hour, by opening windows and doors.

21. Floors of shops and of water-closet apartments, to be scrubbed weekly, swept daily, and kept free of refuse.

22. A separate water-closet apartment shall be provided for each sex, with solid partitions to extend from floor to ceiling, and with separate vestibules and doors.

25. A sufficient number of water supplied wash basins, to be provided, in convenient and light locations within the shop.

26. Suitable hangers should be provided for the street clothes of the employees, and separate dressing rooms to be provided wherever women are working.

28. All seats to have backs.

Altho at present only 319 shops visited before the last report have complied with all requirements and received certificates, there are conspicuous improvements in a large number of factories, not yet entitled to be "certificated," and the educational campaign by bulletins and lectures, etc., is bearing good fruit.

Now to those who have realized the significance of this well worked out plan for a just industrial peace and sanitary standards, in a hitherto utterly anarchical trade, the question naturally arises, will the New York plan be extended without unnecessary delay to other city centers of the cloak and suit industry? Or must history repeat itself? Must each separate city learn by painful experience what it has taken years to teach employers and employees of New York, that strikes and lockouts, broken contracts, black lists and boycotts, with their attendant waste and suffering and bitterness may be abolished forever in the trade by the substitution of the rulings of industrial courts, where disputes may be adjudicated? It would seem that conscientious, intelligent manufacturers everywhere would take immediate steps to adopt the New York plan, quite as much for their own peace and prosperity as because of the democratic principles involved. And surely the public should be interested to insist that industrial disputes, as well as all other disputes, should be brought into court, not left to be settled by dynamite, on the one hand, or on the other by the slugging of cold and hunger which have "settled" so many strikes unjustly. We have now a complicated civilization. "From oppression by force of arms we have come to oppression in subtler ways," and it lies largely with the public whether the labor movement shall progress on lines of evolution or of revolution. A crisis is at hand and the decision must be made quickly.

LONG HOURS AND SHORT PAY IN "OUTSIDE SHOPS"

To secure to the public not only the rights, but also the accompanying responsibilities of their industrial copartnership with employers and employees, a nation-wide campaign is now proposed by the Cloak and Suit Manufacturers' Association and the International Ladies' Garment Workers' Union to enlist and educate consumers to meet their responsibilities by casting the industrial ballot of their purchasing power for garments made in protocol factories.

In Ohio, Illinois, Michigan and Ontario, Canada, the appeal to the public to further the extension of the New York plan is already in evidence. On the 1st of November, 1911, the International Ladies' Garment Workers' Union appointed a committee of union representatives to carry on a campaign in the Middle Western States and Canada to arouse the public to a realization of their power and responsibility as consumers. By means of circular letters and public addresses, church audiences, women's clubs, suffrage and teachers' associations, benefit societies, trade unions and socialist organizations have been interested to form local committees to insist that merchants shall supply their patrons with "protocol" garments.

During a recent strike in the Cleveland cloak and suit trade the plight of the young and pretty girl "finisher" in non-union factories was brought to public notice for the first time. For example, the story was told of a skillful finisher who had worked for over a year at $4 per week, and ventured at last to ask her foreman for a "raise." The man looked the attractive young girl over from head to foot and said that if she was "agreeable" he thought a higher wage could be arranged. This was a married man, with six children, yet so unmistakable were his advances that the young girl left the place. The affidavits of this girl and many others prove these occurrences to be quite ordinary.

In Toronto, again, during a strike in a so-called "model" factory, evidence of a similar nature was brought out. A little girl of fifteen testified that a man who dispensed "tags" insulted her regularly. She found that the "stitcher" could be induced to accept her work without a

"tag" if she paid a penny, and so each week she would thus lose from twenty to thirty cents from her pitiful little income to avoid the familiarities of the "tagger." And her case was typical of many others.

In protocol shops such wrongs would be reported to the board of grievances and redressed without danger of the loss of a "job," while in non-protocol shops a complaint was almost sure to result in extra trouble or dismissal.

Another form of exploitation of girls in unorganized shops is the appeal to their sympathies, which are always quick and generous. There being no fixt prices regulated by price committees, a subcontractor has merely to tell a "hard luck story" to his "finisher" to induce her to knock off part of the price promised her —a wife's illness, a child's need, etc.

All such evils the agitation committee of the International Ladies' Garment Workers are depicting to the public, as well as dangers to health and life from overcrowding, where the atmosphere is deadly and the constrained position a menace to body and nerves; leakage from gas irons, which is accountable for so many fainting spells; lack of proper toilet facilities; inadequate fire escapes, with the risk of a recurrence of the Triangle fire tragedy; home work; child labor; and all the rest of the soul and body destroying evils. And it is clearly shown by the evidence of the committee that "model" factories, as well as others, will bear watching for some or all of these evils. The public agitation committee especially impresses upon consumers the protocol provision for arbitration, pointing out that among all contradictory claims of disputing employers and employees there is no sure way of learning the truth except thru arbitration committees which have power to collect all the evidence.

In most cities where the garment workers' committee has appealed to the public, the response has been encouraging, and merchants who have hitherto bought garments from non-protocol factories are now using their influence upon the firms with which they deal to help bring about the New York plan. The merchants write personal letters or sign "merchant's petitions," which are forwarded to the secretary of the various manufacturers' associations.

The modern woman is no longer concerned only that her garment shall be in good style and reasonably priced; she has become so sensitive to industrial injustice as to refuse to wear clothes which reek with the misery and wrongs of her working sisters. The club women have been brought in contact with the striking garment workers, have wept at the pitiful sight of mere children in pathetic processions during a losing strike against grievous wrongs. Her heart goes out to helpless groups of child victims of the present order, and she is passionately eager to do her full share to save them. The church and the university, too, here and there, are joining forces with labor organizations to substitute arbitration for industrial warfare, and encouraged by the awakening of public interest the protocol factories are now preparing to adopt a label, which will insure the public's getting what it asks for in the way of "fair" and sanitary garments. It is the psychological moment for an appeal to the public, and all signs point to an extension to all garment industries in the United States and Canada of the principles and methods of the New York Cloak Makers' protocol.

New York City.

A Professor's Dilemma

BY THE PROFESSOR HIMSELF

I AM in a dilemma—what shall I do? Reduced to lowest terms and stripped of superfluous verbiage, the reasons why I find myself in this dilemma appear to be three: (1) I am a college professor; (2) I am married; (3) I have four children.

But are not college professors legitimate functionaries, reasonably productive members of the truly social class in twentieth century economy? Is not holy wedlock the normal status of grown-up men, including the professor? Finally, do not people marry that they may have offspring? Whence then the dilemma? The dilemma is assuredly not less real because of the paradox—quite the reverse! It is rather the paradoxical situation that makes of it a real dilemma.

First, being a professor of economics in a far-Western university that is loyally doing its work under the general auspices of a leading religious denomination, I hold excellent vantage ground for observing the aviation of commodity-prices while enjoying a salary that may be relatively good but is admittedly none too princely. The economist teaches the laws of production of wealth and explains how great fortunes are made, but with the prices of his own household necessities soaring does not always perceive that he himself has become a victim of diminishing returns, or intellectually perceiving it with sadness, his dilemma is thereby the greater.

Nevertheless, given even a fair salary with an environment of optimistic youth and many books, possessing *entrée* to polite society, a professor—if not already too old—may go on teaching and maintain a reasonably comfortable existence even if he cannot make provision for a rainy day or for declining years.

Secondly, I am a married professor, and wedlock is held the normal state of man, including the professor. One would hardly accuse me of undue haste in the matter of marrying (perhaps a too common fault of young instructors with ambitions for a doctorate of philosophy) since that happy event was not achieved till I had reached the age of twenty seven. had received the coveted Ph. D., and had accepted what might be considered a moderately promising academic position. This recital of facts will compare favorably with a corresponding statement of the average experience of my male colleagues, nearly all of whom are also married. Very well. But here come we to the parting of the ways; for

Thirdly, I have a family of four children—not a very numerous group when compared to the children of Susannah Wesley or the brothers and sisters of Benjamin Franklin or the typical family of the poor—and my average colleague has not. Glancing over the names of my male colleagues of the faculty down to the rank of assistant professor, I note that the average family of the average colleague consists in four-fifths of one child; and if it be permissible to drop out of the count Professor ——— (the only simon-pure *paterfamilias* in the faculty), who has just been granted leave of absence for a year, the average family of my learned colleagues, with an average age of at least forty, consists in just one-half of one child!

I propose now to take the patient reader further into confidence by being even more specific in my remarks. There were during the academic year 1911-12, excluding the president, twenty full professors (three of them being women and unmarried) in the Liberal Arts Faculty. Only one man of the seventeen was unmarried. *No baby was born to the wife of any one of these professors.* Of the men ranking below the full professorship a strong majority were married; yet *no baby was born to the wife of any of these assistant professors and instructors.*

But the thing that is more startling than the fact that last year was an "off year" for babies in our faculty is the fact that *every year for the past decade at least has been an "off year" for babies;* and as nearly as one may casually discern the signs of the times the future

may quite possibly furnish another illustration of the saying about history repeating itself. Professor ———, whose leave of absence has been granted, holds the noteworthy record of being the father of seven children. I am acquainted with a high school principal who has seven children and another university professor of the younger generation whose family consists of six delightful little girls; but such families among the teaching fraternity of the present day are strong reminders of a type or species that has become all but extinct. Now Professor ——— has been a member of this particular faculty for nine years, and he has gravely informed me that barring his own household *not one of all the professors' families during this entire period has received a single visit from the friendly stork.* Is that not a somber truth in the midst of an intellectual world? Or does it savor somewhat of gaiety? Or is it simply a shining example of good and proper form?

Is it any wonder that I find myself in a horrible dilemma? Am I then to set myself down a fool for getting married if I intended to be a professor, or am I a fool for begetting and rearing children after I did get married—which horn of the dilemma shall I choose? Of course it would be ungenerous and undemocratic to intimate that any of my colleagues had committed folly in not having children, for do they not constitute an overwhelming majority? Must I therefore conclude that my own blind folly consists in the rearing of offspring requiring such attention as prevents me from being a more loyal and effective professor? No, my own mind rebels against such an inference and keeps persistently raising the query, Why do persons marry unless to have offspring?

Is there any assignable reason why college professors should seek to perpetuate their kind? To be sure I have often as a teacher of sociology pointed to the declining birth rate in America and elsewhere and to the large family type among those admittedly relatively unfit. I have even gone so far as to urge the elemental importance of the science and practice of a sane sort of eugenics, that is, the breeding of a superior race of human beings; it seems to be a principle of eugenics that the younger children of good-sized and large families have better chance of usefulness and success in life than the first born. Now if most of the college professors and other classes theoretically best qualified to transmit desirable qualities to offspring have no offspring, and the few that have offspring are generally the parents of families of one child each, is it not literally true that society is dying off at the top?

Other phases of the dilemma emerge. I cherish the wish—who will gainsay that it is perfectly normal?—that my wife shall be the mother of children; but being a mother of children, we agree that she must give large attention to her home and theirs. Now the high cost of living and the not-too-princely salary preclude the doubtful luxury of having a maid or domestic; how then, pray tell, is my good wife to compete in personal appearance, or in participation at innumerable college functions, or in the church or club circles, with the more leisurely, dainty, and literary (or musical) wife of my childless colleague, who truly represents a strong majority? And so it becomes perfectly obvious that my wife's dilemma is not less real than my own. Indeed, my own dilemma is hers and becomes intensified in the humdrum character—is it, after all, humdrum?—of her life in large part. Neither she nor I regret our children, with their robust bodies and budding souls; must I confess it? we are even inclined to bestow pity (how seemingly absurd!) upon the childless majority; both of us would be instant to resent the slightest suggestion of chloroform. Then must the dilemma remain? Or, how shall I extricate myself—and my wife?

That my professorial dilemma is not trumped up nor merely academic will be apparent to the indulgent reader as it is to the economist when it is reflected that the professorial salary, under the conditions actually obtaining, will inevitably tend, like the minimum wage of the day laborer, to be gaged by the necessary expense of the family, striving to maintain a certain appropriate standard of living. Assuming that my own salary will fairly meet the modest needs of the average family consisting of parents and one-half or four-fifths of one child, what

is to be said for the backs and yawning stomachs of my four strapping youngsters, or of Professor ———'s family of seven?

And besides, the average professor's wife, having no children and not being excessively fond of dogs, is likely to be needed by her always busy husband as part-time secretary and assistant. In this situation the economist perceives another tendency almost as natural as the former —and quite as gloomy for the *paterfamilias*—namely, the compensation of the professor becomes in a measure the composite wage of his family. Alas, then, for that professor whose family requires the more constant and serious attention of his wife and ought to extract some modicum of time and thought from even the male parent! His prospect is extremely good for being his own secretary and operating his own typewriter. Precious little time has his busy wife to make abstracts of new books for him, read student themes, or even return all the social "calls" of those who perchance have little else to do but to call.

And here again emerges an aspect of the haunting dilemma. Why should my wife and the mother of my children be thrust into competition with the childless ones in matters of social conventionality? Is it human, is it feminine, for the carefree ones to avoid every slightest air of pitying condescension, of patronizing sympathy toward their sisters whose conversational interests are more likely to be babies than books, home discipline than social and civic uplift? But such sympathy—my wife will have none of it! However absurd or preposterous it may seem, she actually feels a sense of pity for her lonely, childless friend, who must busy herself about everything but the rearing of a brood of young. *Behold the paradox of pitying and being pitied!* (I am bound to remark parenthetically that whether or no this sense of pity is really felt by any of the ladies, they are all too well-mannered to show its slightest trace.)

I have wondered if the faculty of our university is really an exception and if the professors in other institutions do actually as a rule have families that are worthy the name. My impulse is to wish this to be the case; but perfect candor and limited observation compel me to set myself down as the exception or—what is worse yet—a survival of an earlier and now almost extinct family type.

Therefore the very summit of absurdity is reached when I solemnly assert, as I now do, that whether I represent the rule or an adventitious exception, whether a normal human being in the enjoyment of natural powers or a relic of an obsolescent type, I am literally proud—even to the point of perverseness—that I have at least my four children and that my wife is their equally proud mother. We have seen trouble and sickness, even to the very verge of death; we have not escaped the rigors of self-denial during a single year of the seventeen years of married life; our children (being children) have not always understood or appreciated our efforts and our devotion: but in the face of it all there is no calculus by which we can bring ourselves to wish release from the elemental duties of nurturing the family group; there is no prospect of pleasure in this pleasure-loving age and no appeal to the common weal in this day of social betterment that can free us from the moral imperative to go on toiling and sacrificing in order that we may have offspring and suitably nourish our offspring. We are unable to escape the conviction that the *raison d'être* of the wedded state is parentage, and the *raison d'être* of parenthood most surely includes an unselfish devotion to the best interests of the children.

Nevertheless, insistence on such principles does not deliver me from the predicament of my dilemma—quite the opposite again! And candidly I will not allege that I altogether enjoy a certain absence of the enjoyment possible to my childless colleague; the temptation to covet for my wife more of the cultural and esthetic advantages open to his wife is at times a real temptation; it is not pleasant always to be buying clothes at end-of-the-season clearance sales and not to buy many desirable books at all, because of the limitations of salary—perhaps unconsciously computed on the basis of the family of one-half of one child.

And so my dilemma remains—what shall I do?

I am resolved what I shall do: I shall leave the city and, cleaving to my family,

seek the country, and my nature-loving wife shall lead the way. There the friendly trolley will afford easy access to the university. The younger children will find expression for their love of animal pets and scope for the instinct of play; the older ones will learn something of the discipline of wholesome work and the culture of toil while at the same time contributing to the family income, and my helpmeet (who hails with joy the change) will find tonic for her nerves in the largeness of the open while peradventure she becomes the envy of her childless friends back yonder in the city.

The die is cast! Just how complete and wide shall be the conquest on the other side of the Rubicon—that is, at the end of the trolley—doth not yet appear.

Ted

BY LOUISE DUNHAM GOLDSBERRY

[Faithful readers of THE INDEPENDENT may recall "Ted," as reported in the issues of November 1, 1906, and September 12, 1907.—EDITOR.]

WE were going on a trip; Ted and I. We'd had a car ride, that night, and the *wanderlust* gripped as at smell o' smoke, up Union-Station-way. That, and the pendant globe-fulls of fire, making lovely lanes of shining in the dark.

Ted sniffed. Sniffs of that travel-smoke; that alluring acrid tang of the breath of the engines, noses pointed away-wards.

"Dat's a *mos'* 'licious smell," he sighed; "seems like we's goin' a-goin'."

"Makes me want to travel, Ted," said I.

"Unh-huh," said Ted. And there were *pages* in that *"Unh-huh."*

We finished our ride in comparative silence. When all's said, why words? "Why should a man deck himself out with vain words," said the lovely old Athenian, "at a meeting of friends such as this?"

Ted's wee legs crossed and took-turn-about. And I inventoried our stock-in-change. Mentally.

Likewise, Ted.

"I'm dot near-*ly* a hunnerd dollars," he said with dignity; "al-*mos'* nearly, in my's bank."

"Truly?" said I, very respectfully.

"Yes," he meditated; "I'm *a* dime an' a *new* dime an' *a* dold penny an'—an'—*an'* a dold penny," he sighed, with the fat unctuous sigh of plenteousness only the very rich *can* sigh.

He surveyed the landscape. There was the station. He knew the full complement of wing-spread eagles along its front. Knew, intimately, the strings of lights that made beautiful the darks about it. For sometimes in sheer orgy of adventuring we'd walk toward it from the outer dark and wade slow luxuriant way into the flickering sea of light, thru it and out the other rim of enclasping dark. And we felt we shone effulgent, come thru that white crystal flooded fire.

He counted.

"One—two—free—ten."

Then, re-reminded—"I'm dot *a* ten in mys bank," he murmured, along with the stringing of the globe-fulls of fire; *"an'* a new ten an' *a* dold penny."

Then the Popcorn Man came past with his little cart. And Ted gave himself up to the delectable bargaining of five-cents-worth of popcorn. Popped while you wait. And buttered. And you honor the Popcorn Man with deference due a professor of the art of turning little hard corn into a buttery feast. And there's always the learned discussion as to how *so* big a popcorn blatters out of *so* very small *a* grain. And sometimes there's a touch of political conversation.

Thus:

Said the Popcorn Man: "Are you a Republican *or* a Dimmycrat?"

Said Ted: "I'm a gen'leman."

Said the Popcorn Man as he went on with his little cart: "Sez he, 'I'm a gentleman,' sez he. Just ups an' sez 'I'm a gentleman' sez he."

We find a seat, and from our niche of shadows watch the grasses where the

electric lamp drops hoops of silver and hoops of black and the tree where every leaf in the transmuting light is a lantern of pellucid green.

And where a gentleman can eat his popcorn without feeling that the eyes of the world are upon him and can tell his mother that she is the most beautiful thing in the world with no fears of being overheard.

"I wonder," said I; "Ted, suppose we should?"

Ted delicately crushes a popcorn and puts a buttery kiss upon my palm and exchanges courtesies with a black cat. A black cat with yellow jewels splendid in its whiskered face and a great plumy tale. A cat that ought to be named Vishnu for his jewels and his sublime demeanor.

Ted proffers popcorn and the cat licks the butter and fans himself with his plume of black.

"'*Spose* this little kitty goes to our own sefs' house?" he queries.

"'*Spose* we don't scat it off?" he queries.

"'*Spose* it's losted," he queries, "an' *wants* to be 'dopted?"

I like to let Ted arrive at his own conclusions. So I waited.

Ted eyed me, out of the privacy of his reflections. The satin lips curved exquisite sweet. The light tipped his fringe of lashes with sparkles of baby-gold. The great eyes were fathoms deep of sweetness.

And the black Vishnu glittered his yellow jewels at him and waved his plume. All the alluring splendors of him.

Ted sighed. And delicately crunched a popcorn. "Well," he adjudicated; "Nixie's a per-*fek*-ly orful sweet kitty."

"She is," I acquiesced.

"Maybe her tail'll *grow*," said Ted.

"Yes?" I said, politely.

"*Unh-huh*," said Ted.

And the cat just stayed and audibly enticed. Purred and made eyes and swung his black plume and Ted blarneyed back: *How* he was the mos' bufull*est* kitty in town, but he loved Nixie hardest *'cause* she was Nixie and *how* he'd love to 'dopt him and *how* he 'sposed he was really *a* King Cat and please *call* again nex' time we's visitin' this little green bench. And the cat made gracious adieux and was not.

"*Fink* he was a truly cat?" said Ted.

"Well," I speculated, "I can see his crown jewels a-glitter down there."

Ted looked.

"Like the Cheshire cat's smile," I explained.

"*Unh-huh*," said Ted.

We'd absorbed all the night. All its creamy cool airs and its glamors of globed fires and its great translucencies of light-suffused trees and the shreds of music that off in the night's gloomering went soft and low. And up in the sky the Capitol's lantern gleamed and the Star-Spangled Banner showed like a lovely tulip in the fields of air.

And our journey really began then.

Ted's prayers were slow, that night. The devout little voice dropped its tender sweets of love into God's palm with the silver net of sleep already tangling in them. In the dear loneliness of our lives Ted's "Our Father" was a very real Personage, to whom was brought all the day's important doings.

"'*I—pray—the—Lord*'"—Ted's head went lower and the little slow, sweet voice dripped its word-drops—"*The—Lord—to—det—me—dat—dat—kitty.—*" And Ted was away, dream-sandaled, to go with the King Cat on his parade low in the white-fire-rained grasses of the night.

And the-night-before came.

We had a new frock apiece.

New frocks were of a rarity to make them of quite incredible value in our eyes. And we tried-on and preened. And packed.

And Ted held long conferences with Bonnie and Nixie, separately and conjointly.

He explained the impossibility of their going along. And while his *dear* ol' black Patsie would carry *all* his keys *an'* keep house, Bon mus' keep off all bears *an'* lions *an'* buggelers *an'* Nixie mus' *not* run away any a-tall.

And they per-*fek*-ly understood; for Nixie talked back a good deal and sung her very loudest and Bonnie hid his sorrows in sleep, curled into a gray-silver ball in the blue velvet chair.

And it was really the night before.

Ted was in my lap. We always had a final love-make when Ted was all ready for bed. We told stories and nice little

easy-to-guess riddles and sang lovely duets. Such as, for instance, "Frog went a-courting he did ride," and "Billy Boy." Ted preferred The Frog, for we could improvise, endlessly, after we had reached "The-first-came-in-was-a-Bumble-Bee," and the number of the wedding-supper guests depended upon Ted's sleepiness. Sometimes we quite crowded to overflow the "old hollow tree," and Ted's laughters tinkled all over them as "Next-came-in."

Ted settled himself. The beautiful day was quite gone. We had planned a really splendid trip. A trip regardless of expense, quite to the mountains' rim. We were famishing for hills and the high-priest places of earth where the mountains lift starward and the clouds moor against the peaks and the junipers fill the days with fragrance.

"Want me *to* tell a story?" said Ted.

"Will it be a nice story?" said I, critically.

"I fink," said Ted.

"Once upon a time," said Ted, "fen Dod was takin' *a* walk a-huntin' muvvers for some nice childerns He was makin', He finded th' *bu*-fulles' muvver 'n th' world." Ted paused. We always paused at the proper places. Sometimes, for lack of material, for being story-maker is not at all easy work and we liked ours to sound new. Sometimes, just to fall to dreaming the rest in a surprisal of sleep with the honey-voice yet sweet with words unspoken. Sometimes, kisses; just kisses. So I said, "How perfectly lovely!"

Ted said with slow emphasis—"'N all *the* world. 'N Dod hurried home *to* det a boy." The pride of manufacture was full on him and he paused, with expectant look, for his meed of praise. And I drew a l-o-n-g breath and murmured in happy voice, "How very v-e-r-y exciting!"

"*Unh-huh,*" said Ted; "'n bimeby th' muvver she heard a 'nockin' an' a 'nockin' on th' door 'n there stood a boy." Ted paused again. He was full throat-deep in the slumber-tide, and the lids were drifting over. But I wanted to hear the finish. So I stopped rocking and Ted caught himself—"'n—'n—th' boy he—had—th' boy had—a sign on 'at said—'at said—Ted."

"O—O!" I said in surprise. "It was You?"

Ted struggled. He was so deliciously sleepy, but he could not forego the lure.

"'Course," he said.

"And what *did* I say?" I begged.

Ted sat up in sudden excitement. "Do I have *to* tell more?" he said; "I fot 'at was all."

He reflected. Then with a huge sigh of relief he said: "You said 'Tum in *twick,* Precious, it's you's turn *to* butter th' toast.'"

I hugged him till he squirmed. The little precious soft body crushed to my heart in a sudden fear of love. Suppose "Dod" had set him down at the wrong "muvver's" door—and all my days had gone lone and empty and unsunned of the light of my baby! Suppose—just *suppose*—Ted had been not mine, but some other woman's God-gift—the thought was unbearable. And I could not put him away in his crib that night. I held him in my arms the sweet night thru. And I did not sleep. But I lived it all over again—the night he stood at the door—and a man's lips kissed my eyes down to sleep after Ted and I had traversed that God-journeying, and out of the fogs and the great crash of the storm-beat banks of chaos and the blinding Presence that walked the storm I heard a man's voice low and thrilled and love-spent—*"It's a boy, Belovèd—it's a boy, Belovèd."*

And it seemed but the gladness of some dream.

The flat city left behind. All its turmoil.

What tho hyacinth and crocus and pansy made great beauty-spots in the green circles and trees aisled the asphalt and every odd angle of meeting streets was grassed in and parks were many?—it was so breathlessly level! Not a little, little hill even, in all the roundabout of it. And I did not love it. It had no roots in me and I was glad with a gladness that clutched the heart-strings of me to feel the rushing wheels under me, the labor and pounding breath of the engine. And I could scarce believe it true, even after the train lamps were lighted and Ted slept.

Just the back of the seat turned over, giving the two seats to us for a "Mann

boudoir"; sound asleep, the brown eyelash shadows lovely dusk on his cheeks.

He had kept awake long enough to ask more questions than I could answer. Long enough to make friends with conductor and trainboy and watch the hills begin to crowd in upon us and the stars to powder the sky in marigolds. And to hear the song of the night begin from swamps back in the black-faced glooms and the wild fields beyond the climbing track.

And he slept.

And after a while, One sat beside me. The band on my finger was but an hour or two new to it and all the wideness of the future was in its golden circle. And the coach settled into the night's hush and the lamps lost their garishness and shone refulgent and off on the mountains a new moon went down in the forests as the black night tide surged deep.

And the back of the seat in front was turned over.

And a great armful of red roses lay there. And I kissed the band but an hour or two new on my finger—*"With this ring I thee wed,"* whispered One at my side, *"to love and to cherish—till—death—do—us—part"*——

And he sat beside me as the black night tide rode in.

And his arm slipped about me; drew my head to his shoulder—*My Lover—My Lover*—and my lips turned to the kiss of his mouth with the thirsty drought of the years forgot.

And the stars went out; one by one. And the dawn stirred in the forests and came in at the windows.

And where the armful of red roses had been on the seat with the back turned over, Ted slept.

And the morning was come. And the mountains.

And Ted and I were in the mountains. The very heart of the mountains; with the dew of the night in their coolness, the trail of the passing of stars yet in the psalmody the pines made and the day-drowned song of the night's voices, locust and bullfrog and katydid and owl, threeping fitful and drowsed and beyond words' telling sweet.

Ted and I.

But One had sat beside me the dear night thru.

And the roses were red, red.

WASHINGTON, D. C.

The Red Dawn

BY CLINTON SCOLLARD

TODAY I watched the wonder of the dawn
Flush out of pearl and fawn,
Crimson the dew,
And make night's close
Irradiant with rose.
The awakened soul divines,
Thru colors and thru lines,
That heavenly beauty shines;
Beauty, by night withdrawn,
Flowers with the glowing dawn,
Flowers—and is gone,
But ever flowers anew!

CLINTON, N. Y.

Literature

The Wind Before the Dawn

A NOVEL may be many things, but if it is to live it must carry a sense of reality. Life refined and sophisticated or life in the raw it may be, but it must live. Among the new books is one* which is peculiarly convincing in its presentation of the monotonous life of a farmer's wife in Kansas, in the early days of privation, before the era of telephones, automobiles and dollar wheat. The struggle against grasshoppers, drouth, hailstorms and cyclones is given with a vivid if somewhat somber power. Only the prairie fires are omitted of those early struggles. The isolation and the deadening round of daily drudgery of a woman in a farmhouse never found stronger expression than in *The Wind Before the Dawn.* But the lack of any comradeship between husband and wife makes the real tragedy of Elizabeth's story. Her subjection to a tyrannical husband is not so much due to her financial dependence, upon which the author insists, as we think, unduly, as to the possession of a gentler nature and a fastidious shrinking from a fight to have her own way.

Altho this novel is convincingly true to Kansas in its local color, yet in its thesis, the evils of the economic dependence of women, it is less applicable to Kansas than to other States. For Kansas, which came into existence during the storm and stress of the earlier woman's rights movement, establisht a standard of property rights for women far in advance of the rest of the country. The laws were more than just to women; they were generous, as indeed they need be. In Kansas, as the saying goes, "a woman owns all her own property and half of her husband's."

A separate bank account may have been the remedy in the case of John and Elizabeth, but we doubt its efficacy, and we have the feeling in closing the book that there are still rocks ahead of the reunited couple. The habit of domination is not so easily broken. The book has value for its reiteration of the truth, "no man is good enough to be trusted with the ownership of another man," and certainly not with the ownership of a woman. The contrast between John's treatment of his business partner and of his wife has its message to husbands who imagine they are fair partners in marriage. Yet love makes its own laws and laughs at statutes. Justice is a good foundation for a new household, it is true, but temperament will build the superstructure in any case, whether husband or wife, or both, control the pocket book, and the art of living together happily is not one easily to be learned. *The Wind Before the Dawn* is a contribution to one aspect of the relation between husbands and wives, and it is a picture of an early stage in the conquest of the West sincere and straightforward in every line.

It has often been remarked that the great plains of Kansas are strikingly like the Russian steppes. The Mennonites and revolutionists who took refuge there found themselves very much at home. It would not be surprising, therefore, to find a tendency toward the same sort of literature, and certainly this book resembles more the Russian novels than it does the ordinary run of American fiction. There is here the same rough realism and dry style, the same oppressive sense of vastness and loneliness, the same intensity of moral purpose. The opening chapters on the stampede of the cattle by the storm of grasshoppers would stand comparison with similar scenes by Tolstoy, Turgenev or Sienkiewicz for vividness and verity. Sudermann's "Dame Care," which also comes to mind in this connection, is near enough to the Russian frontier to be included in the same regional classification of fiction.

The illustrations with which the volume is adorned might well be dispensed with, for they are misleading and quite out of keeping with the text. The artist

*THE WIND BEFORE THE DAWN. *By Dell H. Munger.* New York: Doubleday, Page & Co. $1.35.

uses wood for houses and fences as freely as if it were abundant on Kansas plains in the early days, and he paints a grasshopper cloud blue, whereas it should be yellow, yellow as sand and glinting like mica flakes on the hillside when the wings catch the sun at the proper angle. The writer of this review thinks he knows, for one of his earliest recollections is how these same grasshoppers looked and tasted.

On Both Sides of the Wall

Two books, published recently, give the different aspects of prison life as viewed by the superintendent of a prison and by an inmate of another penal institution. Zebulon R. Brockway's *Fifty Years of Prison Service*[1] tells the story of an honorable career; *My Life in Prison*[2] is the strangely moving record of a dishonored one.

Mr. Brockway began his work in the Albany County Penitentiary as deputy in the year 1851, when he was twenty-four years old; he retired from the superintendency of the Elmira Reformatory in 1900. For twenty-five years he had given himself unreservedly to making that institution a model of its kind. Fifty years of intelligent and effective prison management give Mr. Brockway a right to be heard on debated questions. He does not agree with Mrs. Ballington Booth as to the advisability of "homes" for discharged convicts, thinking it more wholesome for them to be absorbed into the ordinary life of the community as soon as possible. Many of our reforms in the treatment of prisoners may be directly traced to Mr. Brockway and his successful work at Elmira. He believes heartily in education, in manual training, in the indeterminate sentence, and wherever possible in release on parole. There is no feeling that he is discussing a different order of beings, and his sane and wholesome ideas deserve the thanks of all prisoners and the careful study of all penologists. That the criminal is first of all a man, and his crime often an accident, are Mr. Brockway's cherished convictions.

My Life in Prison treats of the San Quentin prison from the standpoint of a prisoner. It has much of bitterness, of morbidity inseparable from the mood of the caged. Yet the narrator apparently tries to be fair, and if his statements are true, he has reason for much criticism of the San Quentin discipline. Such a man as he describes should never have been tolerated as chaplain of a prison, a position in which the greatest tact and sympathy are called for.

> "I shall never forget that sermon. There wasn't a word of charity or a tone of sympathy in it. We sat there and squirmed while he digressed for a moment to tell us it was for our 'good' that we were in prison and that it was for our 'good' that we had assembled to hear him say so."

Fortunately such chaplains are rare. And some of the other officers would not now keep their places for a day in a well managed institution. The lesson of both books is the need of intelligent sympathy in dealing with prisoners. The one thing which prisoners need is justice, for they are quick to resent the slightest injustice. Severe discipline of a semi-military character they do not resent, if it is fairly administered. Mr. Brockway is right in his contention that society must get rid of the idea of retribution in dealing with criminals. They need to be guarded partly against themselves and trained for useful citizenship, and that his ideal is possible Elmira Reformatory bears witness.

Tilts at Ennui

Adventure and romance seek us when we move thru the world. The more we travel, the less do we feel the need of certain books of fiction. Our days are full, our blood flows freely. But imprison us in offices by day, curve our backs in the fields, or fret our minds with domestic problems, and by nightfall we need a tonic. We flee to the theater or to our armchair and a novel, and face to face with human passions, whims, adventures, what not, we for a brief space see, hear and feel what some author pleases to tell us. And such experiences as we involuntarily pass thru in the reading of a novel of mystery or adventure must add some zest to life. It may not be lasting, but it certainly is a tonic.

[1] Fifty Years of Prison Service. *By Zebulon R. Brockway.* New York: Charities Publication Committee. $2.

[2] My Life in Prison. *By Donald Lowrie.* New York: Mitchell Kennerley. $1.25.

So fortified in spirit, we mount our good armchair, and are off at a gallop into the Land of Surprise to break a lance with our deadliest enemy—ennui.

As a tonic for the jaded, *The Blue Wall*[1] should be prescribed by every literary physican. It is a tale to keep strong men from their meat and dames from the bridge table. Mr. Richard Washburn Child's first complete novel is a success. "What is behind the wall?" asks the doctor attending a child patient as he senses a brooding and malign influence in the atmosphere of the sick room. The answer is revealed in the stories of the doctor, the married couple next door, the old nurse and the automatic chess player. It is a strange and fascinating mystery with divagations into heredity and psychic problems. It grips in spite of occasional diffuseness. Mr. Child will not take it amiss if we trace the influence of Wilkie Collins and Bulwer Lytton in his work. We wonder what would have happened had the doctor taken the child out of reach of the blue wall—but then there would have been no story to tell.

The Sable Lorcha[2] is the symbol of a Chinese junk used as signature to a series of threatening letters received by a New York financier. The narrator, in love with the financier's niece, relates the progress of a Chinese vendetta, the apparent defiance of certain laws of nature, the abduction of the financier, the strange discovery of a double and his secret, adventures in the underworld of Chinatown and other thrills. Mr. Horace Hazeltine revels in adjectives. Here are two examples of his "fine writing": "lethal object of chill-hardened steel" (revolver), and "brutal, torturing onrush of relentless, hard-driven nickel steel" (the approach of an automobile).

The underworld will always have a fascination for those who know it only by repute, or its theatrically staged purlieus by a hasty visit in a sight-seeing car. The Duc de Souspennier, hero of Anthony Partridge's *Court of St. Simon*,[3] amuses himself by playing the part of onlooker among the Apaches of Paris. In a moment of thoughtlessness he invites a young Englishman of a decadent frame of mind to accompany him on one of his expeditions, and the young man is drawn into the undertow of crime. The Duke meets an English girl, woos her hastily; on their first meeting he takes two and a half pages of conversation to propose to her and another page to clasp her unresisting in his arms. Before long he discovers her to be the sister of his young friend who has gone wrong. Love, mystery, noble self-sacrifice of the fictional kind follow fast, and the scene shifts to Soho, London, before things are straightened out and the woes of the estranged couple are at an end. Thruout the illustrations depict purely American types in American clothes. But the story is well told.

The semi-scientific story of the Jules Verne type will always have admirers, and no doubt it was knowledge of this fact which prompted Edward Kimball to write *The Dominant Chord*.[4] A young inventor madly in love with one of the Four Hundred who is about to marry the traditional ducal roué carries her off an unwilling prisoner in his wonderful submarine, where she is confined long enough to change her hate to love. The story is told in a straightforward fashion, tho there is a deal of descriptive padding. The frontispiece, representing the heroine, is from a painting of the feeblest order, and we cannot conceive its original inspiring any mad passion.

Mr. Donald Richberg has contrived to invest a footling plot with interest, thanks to his terse style and ironic humor, which he never suffers to relapse into vaudeville slap-stickism. A bachelor gives a lodging for the night to a young girl whom he finds fainting in the park, and thereafter finds himself constituted her protector against a mysterious pursuer. He has also to combat the protests of his relations. The solution of the mystery is simple, and were it not for the clever characterization and a certain snap in the writing, *In the Dark*[5] would hardly satisfy the seeker of thrills. As an inducement to one kind of purchasers, the publishers suggest some-

[1] THE BLUE WALL. *By Richard Washburn Child.* Boston: Houghton Mifflin Co. $1.25

[2] THE SABLE LORCHA. *By Horace Hazeltine.* Chicago: A. C. McClurg & Co. $1.35.

[3] THE COURT OF ST. SIMON. *By Anthony Partridge.* Boston: Little, Brown & Co. $1.25.

[4] THE DOMINANT CHORD. *By Edward Kimball.* Boston: L. C. Page & Co. $1.25.

[5] IN THE DARK. *By Donald Richberg.* Chicago: Forbes & Co. $1.25.

thing more than is present in the book, by labeling it in part "queer adventures of the unconventional lovers whose romance blooms in the fetid atmosphere of underworld resorts." Such realism as there is is touched with a timid hand.

Baby Grand[6] is a collection of magazine stories by John Luther Long, author of "Madame Butterfly," and dedicated to "Fortune's vagrants, who, principally, inhabit this book." The stories are not distinguished, and their impression on the memory not lasting. The best is that which gives its title to the book, the tragedy of the lost memory of a waif of the sea, which returns to her five years after her marriage to a noble-hearted lifeboat captain. The next best is "Dull Jim," the problem of a sinning wife, an honest husband, and the other woman. "Little Lady" may be commended for the tears it will bring to tender eyes.

A dramatic story with several well staged episodes is written by Beulah Marie Dix in her *The Fighting Blade,*[7] a romance of Roundhead and Cavalier days in England. Readers not acquainted with other romances of the period of stronger caliber will doubtless find much that is interesting in the love of the boyish Von Kerstenbrook, German officer in the Cromwellian army, and a deadly duellist, for the little Royalist heiress. Her devotion to her lover amidst the assaults of her guardians upon her love, fortune and liberty will arouse sympathy. We notice a similarity, no doubt quite unconscious, to the motive of "La Torture de L'Espérance," a short story by Villiers de l'isle-Adam in the trick played upon the hero in inducing him to attempt escape by leaving his cell door open.

In *Lady Eleanor, Lawbreaker,*[8] Mr. Robert Barr has written a magazine novelette, the plot of which might have been conceived by Laura Jean Libbey. The heiress by will conceals the will so that her cousin, the disinherited son of the house, may come to his own. His first thought is to sell the estate to set Richard Sheridan, the dramatist, up in management. The will is discovered, and the young man retires madly in love. The heiress, going to Sheridan's to pay over a sum promised by her cousin, is discovered by him, and there is a jealous outburst followed by a happy ending. This is melodrama and preposterous farce. We cannot see in it any trace of the Robert Barr we know.

If a crazy scientist has found out how to visit a vast city with the plagues of silence, darkness and terrible cold, how are you going to prevent him doing so? In order to drive a political boss out of New York, an unknown madman threatens him by wireless with all sorts of terrors—to come to pass at six o'clock. A young scientist comes to the rescue, and the story of *The Sign at Six*[9] is concerned with his tracking the unknown to his lair just in time to prevent the total destruction of the city. The plot is based on the assumption that one can deaden the vibrations of electricity, heat, sound and light. The story moves rapidly, but lacks the impressive dignity and convincing horror of a Wells romance. As it stands, it is an extravaganza, with a "smart Alec" as hero. Mr. Stewart Edward White's real aim has apparently been to point the moral that city dwellers are too self-satisfied, too godless, and that "it's a good thing for them to find out that there's something bigger than they are, or anything they can make."

There is nothing like masquerade or "dressing up" to set our sluggish blood agoing. We lay aside our own moods with our own sombre clothes. Readers will sympathize, then, with Jeroboam Martin, hero of *He Comes Up Smiling,*[10] who sneaked a suit of clothes and a motor car to play the part of the latest breaker of the Wall Street cotton ring, and came thereby to be transformed from a hobo into a man and to win the love of a slip of a girl. Apart from Mr. Charles Sherman's occasional fancy that "cross-talk" is wit, he tells an amusing story which hurries us rapidly over the improbabilities. Familiar episodes are treated in a comparatively fresh way, and the motor tour has its exciting moments.

Sun Yat Sen. By James Cantlie, M. A., M. B., F. R. C. D., and C. Sheridan Jones. Illustrated. New York: Fleming H. Revell Company. $1.25.

Any life that is worth living must be a life of struggle. Dr. Sun, the first President of the Chinese republic, fought a hard fight, and at last his effort for the overthrow of the despotic Manchu rule was crowned with success. Any reader interested in the life and personality of this hero born of humble parents in an obscure village will find interesting *Sun Yat Sen,* recently published and written by Dr. James Cantlie after twenty-five years' close friendship with the reformer, and C. S. Jones. Dr. Cantlie makes mention of Sun Yat Sen's early training in the college of medicine, his manhood, his first connection with the Young China party, his preaching of the gospel of revolution among the people at home and abroad, his persecution by the Manchu Government, his flight, his narrow escapes, and his success in the effort to overthrow the old Government. After he had been persecuted, kidnapped, deserted, slighted, imprisoned, and watched by spies, Dr. Sun, the leader of the Chinese revolution, was made the first President of the young republic. Aside from the account of Dr. Sun's struggle for the liberation of his people from the bondage of Manchu despotism, the book contains a brief review of Chinese history, and concludes with a chapter on the future of China. The first part of the book is full of many interesting facts about Dr. Sun, his life and his personality, which have not yet been touched upon in the many magazine articles about that hero, but the rest of the book deals with more familiar topics.

The Wilds of Patagonia. By Carl Skottsberg. New York: The Macmillan Co. $3.

Three Swedish travelers, one of them a botanist and lecturer at the University of Halle, the two others geologists, tell in this ingenuous volume, thru the pen of the botanist, of their experiences in Patagonia in a journey of two months in 1907-8. It is a frank, refreshing story, but does not try to set forth any of the scientific results of the expedition. The reader can hardly avoid comparison thruout with Darwin's observations upon the same regions, and there is a wide space between the "Naturalist's Voyage in the 'Beagle'" and *The Wilds of Patagonia.* Nevertheless, Dr. Skotts-

SUN YAT SEN AS PRESIDENT OF CHINA
From the Biography published by Fleming H. Revell Company

berg's book is exceedingly pleasant and entertaining, and he enlists our sympathy with him and his companions in their unboastful and thoroly sensible and profitable undertaking. It was all very simple and frugal, and full of profitable study and wholesome endeavor. Thruout the book we move in clear air and long to be ourselves far from our overwrought life amid the plain austerities of the sheep ranches of Patagonia. Much of the ground covered by these Swedish students was exhaustively studied by King Edward's Boundary Commission under Sir Thomas Holdich, which settled the line between Chile and Argentina, and other scientific expeditions, including one from Princeton University, have worked over this territory. But much remains to be done, and it is a good thing for such men as these three friends, who relish wholesome hardship, to do the healthful, useful things which these men did. In addition to gathering worthy scientific results, such visitors to Patagonia will see the noblest scenery of lake and mountain, a new country raw and summoning, and have as good a chance as the world offers to return to nature.

The Kallikak Family. A Study in the Heredity of Feeble-Mindedness. By Henry Herbert Goddard. New York: The Macmillan Co. $1.50.

This is the most convincing of the sociological studies brought out by the eugenics movement. It would be hardly possible to devise in the laboratory experimental conditions better adapted to produce a clear and decisive influence of heredity; nor could there be a more impressive lesson of the far-reaching and never-ending injury done to society by a single sin. As the result of a casual liaison, away back in Revolutionary times, between a young man of good family who had joined the patriot militia and a half-witted girl at the tavern frequented by his company, there developed a progeny of degenerates which have been a burden to the community from that time to this and will be to the end of time unless we grow wise enough to put a stop to it by law. The investigation conducted by Dr. Goddard, Director of the Research Laboratory of the Vineland, N. J., school for the feeble-minded, under the patronage of Samuel S. Fels, has traced the descendants of this illegitimate branch of the family tree of the Revolutionary sire thru six generations, and found them everywhere filling almshouses, asylums and jails. Environment makes little difference with them. Some are in the city slums, but those who live in the open and healthful country are no better. They make their own slums wherever they go. Free schools and free government are of no use to them. They cannot learn; they can do only the lowest grade of work, and that not well. What they can do is to reproduce, and this they do at twice the average rate of the community. Of the 480 descendants of this line 143 are known to have been or to be feeble-minded, and among them are many drunkards, illegitimate children, prostitutes, criminals, insane and paupers. The photographic illustrations show the type, familiar in every community. So much for the "-kak" side of the picture; now for the "kalli-." After sowing this crop of wild oats, the young patriot settled down and married a respectable girl. Their descendants number 496, all of them normal, respectable, law-abiding people, many of them prominent in professional, educational and political circles, playing an important part in the history of New Jersey and of Princeton University, and wherever scattered over the country counted among the leading citizens of the community. The genealogical charts of the legitimate and illegitimate branches of the family printed side by side upon the same pages tell their own story in graphic language, more impressive than the story of the Jukes, because it gives both sides and shows in these sons and daughters of the Revolution the good as well as the bad influence of heredity.

The Forest. An Idyll of the Woods. By Edwine Noye. 16mo, pp. 49. Buffalo, N. Y.: Otto Ulbrich Co.

A dainty little dramatic venture finds place in this dainty little volume, which is Miss Noye's first entrance into authorship. It is a metrical tale of love, in which a dryad seeks a human lover, and

thereby gains a soul, which the lover loses at the same time, quite forgetting his wife and child. While the dryad learns to love, the man forgets to love and sports with butterflies and pixies, till Pan teaches his wife to die and redeem her husband. But now the dryad, by a similar redemption, gives up her soul and vanishes into mist, that the wife may be recovered to her husband and child. The story is delicately and gracefully told. The key of the plot is in the answer Pan gives to the dryad, who has asked vainly of zephyrs, butterflies and flowers, What is the thing called love?

"Fair Dryad, daughter of the sun-flecked wood,
Attend. The thing called love comes with a soul;
Ye elemental beings know it not.
It is a great, sweet feeling in the heart
Warming to one man only, or one maid;
Yearning to do for them,—if need, to die.
Willing to leave all home and kindred ties
And follow this one soul thruout the world,
To smooth its path and suffer all its pain.
On this strange human thing is set a seal,
The meeting of the lips they call a kiss.
If thou canst gain, soulless, this mortal's love,
With his first kiss thou shalt receive a soul,
And learn to love with force outreaching his.
For, when a creature of the woodland things
Has, struggling, gained a soul, that soul shall be
More pure and strong and brave than humankind
May ever reach. But thou must bear great pain,
And keep his love all thine,—for with its wane
Comes death."

The Good Girl. By Vincent O'Sullivan. New York: E. P. Dutton & Co. $1.35.

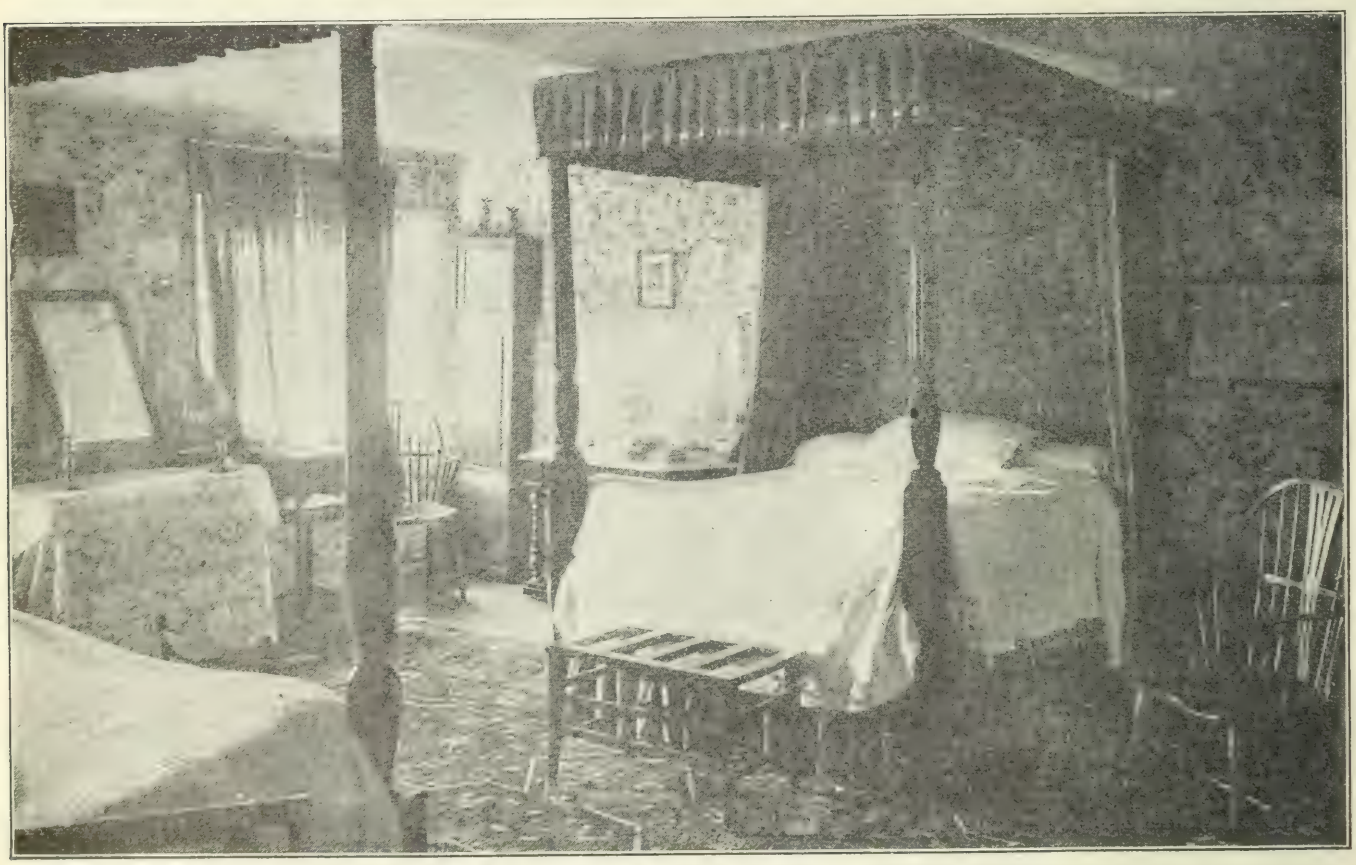
Mr. O'Sullivan calls his new novel *The Good Girl,* but there is none in the book. He throws down the gauntlet in his title as Hardy did in his sub-title of "Tess; the Story of a Pure Woman," but in the case of Tess there is opportunity for a real difference of opinion among readers. In *The Good Girl* there seems to us none. The story is the sordid and repulsive one of a man who uses his wife's great beauty and musical talent to attract a man of wealth to support his family, which includes a daughter, whom the lover of her stepmother finally marries. The situation is revolting. But a finished art goes to the unfolding of the tale, and the characters are drawn with wasted skill. The villainous Captain, his unscrupulous wife, the vacillating and victimized hero, the ill-bred Louise, whose claim to the title of "good girl" may lie in the fact that she was less vile than the rest, and a crowd of minor characters that come and go, are well rounded and convincing figures in a drama of decay.

Engraved Gems, Signets, Talisman's and Ornamental Intaglios, Ancient and Modern. By Duffield Osborne. Illustrated. New York: Henry Holt & Co. Pp. 424. Thirty-two Plates. $6.

When a man begins to collect intaglios he cannot escape being impressed at once with their beauty and manifold significance. He desires to know more about his own gatherings, and if his newly aroused interest is serious, he must go to Osborne's *Engraved Gems* for information, since there is no better book available in this field. Mr. Osborne has done painstaking work on his present volume. As a collector he has had a genuine desire for light on the specimens that came into his hands or under his observation, and he has sought after information with both intelligence and enthusiasm. The present book gives an admirably comprehensive survey of glyptic art, from its early beginnings in the island of Crete down to modern essays in gem engraving. The rise and progress of this art, its decline and fall brought about directly thru the agency of the revelations concerning wholesale forgeries in the Poniatowski collection, dispersed in 1839; together with some estimate of the value of the art of engraving stones; and an account of the deities and other personages used as intaglio motifs, with side lights on their appearance and attributes; the heroes that inspired the gem engravers of antiquity and their attributes; a description of the tools used by the glyptic workmen, and something more than a mere mention of the stones used as material, all find a place in this book, which is useful alike for reading and reference and is deserving of the highest praise.

The Prison Without a Wall. By Ralph Straus. New York: Henry Holt & Co. $1.30.

"He seems to make of his books a real world, and of the world a dream." This, his tutor's characterization of the gentle voluntary prisoner, fits Sylvanus de



Bohun remarkably well, and it describes many other scholarly recluses, in Cambridge and other unwalled prisons. Sylvanus is a Fellow of Cambridge, and almost as soon as he is settled in a quaint set of rooms over the gateway of the little College of St. Mary's he wishes "to stay there all his life." He becomes a bit of a bibliophile and learned in bindings and first editions. Shaken out of his calm retreat by the urgency of his friends and the call of his duties as a rich landowner, he makes a journey to London and into life. We do not see how the author had the heart to break his, and show him the cruel and treacherous side of experience. So gentle a spirit deserved a kindlier fate. Sylvanus is like some bewildered angel in the presence of evil.

The Spell of England. By Julia de Wolf Addison. Boston: L. C. Page & Co. $2.50.

This volume, like the other "Spells" of the series, combines amusement and instruction by embedding miscellaneous fragments of history and legend in a matrix of sightseeing narrative, the sort of information the tourist needs in order to appreciate the background of the places he visits. The author has gleaned from a wide field, tho her own ingenuous observations do not add much to the value of the book. There are over fifty half-tone illustrations, one of which we reproduce, the scene of Mr. Pickwick's romantic adventure with the middle-aged lady in curl papers.

The Chinese Revolution. By Arthur J. Brown. Illustrated. New York: Student Volunteer Movement For Foreign Missions. 75 cents.

Among the books on China recently written and published it would be difficult to find a volume containing more timely and authentic information than Dr. Brown's *The Chinese Revolution.* The book gives more than what is indicated in the title. It touches upon the Chinese customs, their way of thinking and their great potentiality for development. It deals in a most readable way with the intellectual awakening and educational progress of China and the quickening influence of Christianity in bringing about such social reform as the anti-opium movement, the abolition of foot binding, the abandonment of idol

THE SCENE OF MR. PICKWICK'S ROMANTIC ADVENTURE IN THE WHITE HORSE INN
("The Spell of England"; Page)

worshiping, the reorganization of judicial procedure and the penal code. Thruout the whole book the author's attitude toward the Chinese is very friendly and sympathetic, as his reproach of those nations mistreating the Celestial Empire is very severe. Dr. Brown has a high opinion for the leaders of the new government, which is based upon his wide personal knowledge and much study. He never hesitates to condemn in his book "the worst elements of Europe and America" and all kinds of Occidental vices, fast spreading in China. The author thinks that Christianity is the only remedy for the "Yellow Peril," which, in his opinion, may become a fact if Western Powers keep on oppressing China and heed not the teaching of the Gospel: "All things whatsoever ye would that men should do to you, do ye even so to them." A new day is dawning in China, and it behooves Christian nations to give her a fair deal. In spite of many quotations from the Chinese and English authors, and numerous statistics, the book from beginning to end is very interesting. The author's ability to keep a great mass of incoherent facts coherent and readable is noteworthy.

Pharisaism: Its Aim and Its Method. By R. Travers Herford, B. A. New York: G. P. Putnam's Sons. $1.50.

The attempt to present fully and fairly the position of the Pharisee is a most commendable one, and one which the author has succeeded in accomplishing with remarkable success. Going to Mishnah, Talmud and Midrash, Mr. Herford makes out an excellent case for the Pharisee, demonstrating very clearly why Paul and Jesus did not sympathize with his view of the world, and how wide the divergence was between the Christian and the Pharisaic point of view. The book will be read with pleasure by every one who desires to comprehend the true character of the Pharisee, and at the same time the reader will gain an insight into the Jewish idea of Thorah, which will prove a revelation to those unable or unwilling to go to the sources. Mr. Herford has gone directly to these sources, and presents a most sympathetic study of Jewish ideals and modes of thought. He has succeeded in putting aside the prejudices animating so many German scholars, and does not hesitate to give the Pharisee full credit for all the good that is in him. As a corrector of the New Testament presentation of the Pharisee, this book ought to receive high praise.

THE SPECIAL MESSENGER
From Seltzer's "Triangle Cupid"

The Triangle Cupid. By Charles Alden Seltzer. New York: Outing Publishing Co. $1.

The "Triangle" is a ranch in that sun-bleached Southwest dear to romance of the vigorous out-of-door type. It gives its title to a new novel, *The Triangle Cupid,* in which Mr. Seltzer writes vivaciously if not boisterously of cow punchers and gunmen, cattle thieves and sheriffs, rattlesnakes and rustlers, and their varying adventures. The best of the stories is that of "The Man on the Ridge," in which a man who had been called a coward proves his courage.

Literary Notes

....A sketch of the life of *William Shaen,* who a generation ago led an earnest fight against the government regulation of vice, is written by his daughter, M. J. Shaen (Longmans; $1).

....A little volume by Coulson Kernahan entitled *The Man of No Sorrows* (Cassell; 50 cents) emphasizes, in an allegoric vision, the worth of sorrow in the building and refining of character. The story is well told.

....A new idea in anthologies is embodied in Anna Sheldon Camp Sneath's *Poet's Song of Poets,* a volume of 250 pages. Here is "a collection of poems in which the poets [i. e., English and American poets] express their appreciation and estimate of their fellow poets"—but only of British poets. The selections are arranged chronologically, by subject. There is no index. (Badger; $1.50.)

....A brief account of *The Montessori System in Theory and Practice,* by Dr. Theodate L. Smith, of Clark University, is published by Harpers (50 cents). Its chief novelty consists in the suggestions as to American applications of the new method of child training. One point noted is the impossibility of adopting Madame Montessori's easy and rapid way of teaching young children to read and write because of our illogical spelling. If English were as nearly phonetic as the Italian our school period could be much reduced.

....The Futurists in art and literature whose ideal is confessedly a "dislocation between every idea and its corresponding reality" are characterized by Father Thomas J. Gerrard in the *Dublin Review* in the following language which, it seems to us, expresses the tendency of the new school as adequately as mere words can:

> "If the Futurists were really true to themselves, each would put himself into a category by himself. One would be a cross between a decadent kangaroo and a recessive split infinitive. Another would be Friday afternoon developing into a pair of trousers. A third might be the shiver left behind after the impact between a snark and a phenomenon."

....To The Social Betterment Series, edited by Prof. Shailer Mathews, Rev. William Byron Forbush, Ph. D., contributes an interesting and suggestive volume entitled *The Coming Generation* (Appleton; $1.50), in which the forces making for the uplift of the young are outlined and many problems of home, school, and social environment are thoughtfully presented. The author covers a very large field in an introductory way and has succeeded in making a book of real value to those seeking guidance in the disclosure and discharge of their social responsibilities.

....Mr. Bryan's Chicago and Baltimore journalism is preserved for future generations in the volume *A Tale of Two Conventions,* and is supplemented with selections from notable speeches made at all three conventions. Virgil V. McNitt is the editor, Funk & Wagnalls the publisher (pp. xxviii, 307; $1).

....The revised edition of Prof. George A. Barton's excellent lectures on *The Heart of the Christian Message* (Macmillan; $1.25) contains a new chapter on the Message according to the Reformers, which makes it still more valuable as a contribution to the history of Christian thought and a statement of Christian fundamentals.

....In *Scribner's* for October is printed a third instalment of the Letters of George Meredith. In June, 1888, the novelist praised the "rude realism" of Henley's "In Hospital." "No realism frightens me," he told the author of the poem; "at its worst I take it as a correction of the flimsy, to which our literature has a constant tendency to recur. Even the lowest appears to me more instructive than Byronics." But Meredith could enjoy sentiment, too: witness a letter to Mr. Barrie, envying him "not the deserved success of the book ["The Little Minister"] but the pleasure in writing it." Babbie, he continues, "carries us—criticism can't grow at her heels." Meredith has something more to say of criticism in a letter addressed to M. Emile Legouis, of the Sorbonne—Harvard's exchange lecturer of the year:

> "I hold strongly to the value of French criticism, whether in praise or blame. The latter is done (by the masters in the art) with so fine an irony that it instructs without wounding any but the vanitous person; and the eulogy confers green laurels instead of gilt. England has little criticism beyond the expression of likes or dislikes, the stout vindication of an old conservatism of taste."

Admirers of Diana will find in the letters to Lady Ulrica Duncombe, most excellent gossip. But perhaps the most striking letter of all, at this juncture, is one addressed to Mr. Morley in 1904, in which Mr. Roosevelt is briefly discussed, Meredith avowing that "he and Porfirio Diaz" have his chief admiration "as rulers of men." Meredith's last letter is published in this same issue. It is addressed to Watts-Dunton, and is occasioned by the death of Swinburne. "The blow was heavy on me," this tribute from the heart begins. "Song was his natural voice. He was the greatest of our lyrical poets—of the world, I could say, considering what a language he had to wield." This letter was penned at Box Hill, April 13, 1909. A month went by—and Meredith himself passes—1809 was an *annus mirabilis* in births—1909 a year of mourning for lovers of English literature.

....Professor Charles Cestre, of the University of Bordeaux, has written a book of 327 pages entitled *Bernard Shaw et son œuvre*, published by the Mercure de France (Paris; 3 francs 50). In the work of the great Irish juggler M. Cestre remarks "a loose technique, a masterly style, a vigorous sense of the comedy, a brilliant mind; but his public has been put out by the paradoxical situations, enigmatic characters, a tone of mockery at once acid and gay, audacious attacks upon Brittanic prejudices, and perspectives of thought which stretch farther than the theater has been wont to represent." Bernard Shaw is not unknown in France, continues his expositor, and deserves to be yet better known.

"He belongs to the school of thought founded by Schopenhauer and Nietzsche, and to the dramatic school founded by Ibsen. . . . In Shaw, vital exuberance jostles meditation and brings about optimistic conclusions. Gaiety, suggestive paradox, fine observation jet as from a spring. Moral and social criticism take on an historical significance: contemporary with a transformation of the English soul, it aids us in comprehending a decisive phase in the evolution of a great people. Finally, B. Shaw is a realistic painter: he curiously observes all the *milieux*—aristocracy, bourgeoisie, common people—and describes them with the truth and relief of life."

M. Cestre apologises for writing of Mr. Shaw after Messrs. Chesterton, Jackson and Henderson have had their say, and explains that whereas their books take for granted a long established familiarity with the work of the dramatist, his own is only an "introduction" for the benefit of French readers. But others than Frenchmen will find stimulating reading here. M. Cestre takes Shaw with high seriousness, but without religiosity. Thus he writes: "In time, he took account of his limitations and tried less and less to appeal to the emotions"—where he is impotent. As a Socialist, he finds the inspiration of his doctrine in "a sentiment united to an idea: sympathy for the lot of the humble associated with the conception of social justice. But Shaw accords much less importance to the sentiment than to the idea." He is only "accidentally" a Fabian.

....Just once in the study by M. Cestre is Shaw's dramatic satire, "Fanny's First Play," named: and there it is not characterized. We wish that the Frenchman might have seen it at London—even now it remains unpublished, so he could not have read it. Certainly the play would lend itself to critical annotation. Mr. Granville Barker's English company, now at the Comedy Theater in New York, gives an uncommonly satisfying performance of the piece—partly because not a single actor or actress is "out of the picture." New York is fortunate in having these well schooled players and this effervescent comedy to enliven the dramatic season while it is still young. Those who cannot enjoy "You Never Can Tell" and "Candida," those who are shocked by "Mrs. Warren's Profession" and "The Shewing-up of Blanco Posnet," will exclaim at the egotism of the epilog and will find nothing commendable about this new "conversation,"—and we pity all such. One does not expect a well-bred play from Mr. Shaw, any more than a "well made" one, but the satire playfully directed now at British middle class "respectability," with all its shams, now at the London dramatic critics, is almost altogether delightful. We forbear to make the comparison with Sheridan's "Critic" which at once suggests itself. Enough that Shaw once again amuses his public, and gives them moral and esthetic problems to muse over. How long have we to wait, one wonders, for the acknowledgment of this anonymous performance by its unmistakeable parent?

Pebbles

THE prodigal son returned. "Fatted calf is out of date," he cried, "give me bull moose."—*Brooklyn Life.*

"I WISH I could kill time."

"Why not play some pieces on the piano?"—*Baltimore American.*

HE gives twice who gives quickly because the collectors come around later on and hit him for another subscription.—*Puck.*

"CHOLLY received a letter this morning from Gladys Maud. He consumed an hour in reading it." "Was the letter very long?" "Not very long. He spent most of the time looking for page 2."—*Birmingham Age-Herald.*

THE Friends' picnic this year was not as well attended as it has been for some years. This can be laid to three causes, viz.: the change of place in holding it, deaths in families, and other amusements.—Kingston (N. Y.) *Freeman.*

MRS. JONES.—Why are you going home so soon? Surely your husband can get along without you.

Mrs. Smith.—I know it. But I don't want him to find out that he can.—*New York World.*

A GENTLEMAN of color who was brought before a police judge, on the charge of stealing chickens, pleaded guilty. After sentencing him the judge asked how he had managed to steal the chickens when the coop was so near the owner's house and there was a vicious dog in the yard.

"Hit wouldn't be of no use, judge," answered the darkey, "to try to 'splain dis yer thing to yo' 't all. Ef yo' was to try it, like as not yo' would get yer hide full o' shot, an' get no chicken, nuther. Ef yo' wants to engage in any rascality, judge, yo' better stick to de bench, whar yo' am familiar."—*Lippincott's.*

The Independent

Entered at New York Post Office as Second Class Matter
Publisher, Clarence W. Bowen
130 Fulton Street - - - - New York

A WEEKLY MAGAZINE FOUNDED IN 1848
One Year, $3.00 Single Copies, 10 Cents

Single copies over six months old, 25 cents. Postage to any foreign country in the Universal Postal Union, $1.75 a year extra; to Canada, $1.00 extra. Subscriptions will be received for other periodicals, and clubbing rates will be granted as low as those offered by any responsible agency.

An order for the change of an address should be received two weeks before the change is to take effect. The old as well as the new address should be given.

For the convenience of our subscribers we will send on receipt of the publisher's price any book reviewed or advertised in our columns.

Volumes of The Independent are completed at the end of December and June, and a full index is furnished free on application. Neat binders holding in book form thirteen current issues will be furnished for 45 cents.

If the numbers comprising any semi-annual volume are returned to us prepaid in good condition with $1.50 we will bind the volume in handsome and substantial half buckram and deliver it free anywhere in the United States.

We are always glad to receive articles for examination, but writers desiring the return of their manuscripts, if not accepted, should send a stamped and addressed envelope. Even so, we cannot hold ourselves responsible for their return. Authors should preserve copies of their manuscripts.

Advertising rates will be furnished on application.

Ulster's Revolt

ULSTER'S *dies iræ* has past with sputter of *ira dira*, and bluster of oaths, and swearing they would ne'er consent; and nothing more. It was a peaceful day. No heads were broken. It was like a holiday. The crowd was out to enjoy itself, the shops boomed with trade and the public houses gave no rest to the busy barmaids. For all the swagger of defiance there is no such passionate rage as when, sixteen years ago, thirty-five people were shot dead and three hundred wounded in a deadly riot. It was not so much an Orangemen's demonstration against Roman Catholic rule as it was a Unionist's device to turn religious rancor to a political end. The constabulary and the soldiers were at hand, not in sight, but hidden in their barracks, with nothing to do, and careful not to disturb the peace.

But think what was the purpose of this great demonstration so carefully worked up. It was to announce to the British Government that if the bill was enacted which should give to Ireland a subordinate parliament, such as our States have, such as every British colony has, they would not obey its laws, would pay to it no taxes, would prefer anarchy to civil order. They did not say they would fight exactly, but they left that open; did not say they would not fight, but they swore a solemn oath, members of the House of Lords, the Mayor of Belfast, clergymen of every Protestant faith, that they would defy the Parliament of Great Britain and defy the will of Ireland, and live and die sullen or fighting rebels.

And who are these men who thus threaten the United Kingdom? They doubtfully hold one corner of Ireland. They are not Ulster; only four counties out of the nine that make up Ulster; and Ulster is but a quarter of Ireland, with a third of its population, about a million and a half of people. Ulster is one of the four provinces into which Ireland is divided, and it includes nine counties. Of these nine five have a majority of Catholics, and four only of Protestants, and of these four, in County Down 45 per cent. are Catholics, and in County Derry 46 per cent. So it is less than four-ninths of one-third of Ireland that raises its threat against the empire. It is silly talk, and imprudent. Suppose their threats should frighten the House of Commons, and the demand of Ireland for home rule should be denied, what sort of an example of disloyalty is this to set before the great majority of the Irish people? Why should they not go into this same sort of rebellion, and with much better right?

This is, we have said, really a political movement which seeks to stir up the old religious animosity. It asserts that home rule would oppress Protestantism. What with the safeguards, if needed, and the spirit of the age, this is absurd. And yet bishops of the Anglican Church are fanning the flame; and the Moderator of the Irish Presbyterian General Assembly opened the Ulster day last Saturday with a sermon to encourage religious and civil strife and rebellion; and the clergy of all Protestant denominations were asked to hold services for prayer on the morning of that day, much as in this country women meet to hold meetings to pray to God and to encourage the voters when they are asked to pass a prohibition law. And yet even the Protestants are not all so befuddled by this Unionist folly. It

is stated that of the five hundred Presbyterian ministers two hundred are no foes to home rule. Indeed, Protestants have been prominent leaders for a hundred years in the long contest for Irish self-rule.

Let it not be supposed that home rule is a purely Catholic measure, meant to strengthen the Catholic Church and to humiliate and subjugate the Protestants of Ireland. Was not Mr. Parnell, the great Irish leader, a Protestant? And he was not alone. We could mention home rule leaders by the dozen who were or are Protestants. Such names as those of Henry Grattan, and Henry Flood, and Wolfe Tone, and Robert Emmet, and Isaac Butt, and Henry Jay McCracken, and William Smith O'Brien, the great leader of 1848, and Professor Ingram, who wrote the most revolutionary of the Irish ballads, "Who Fears to Speak of '98?" as well as the article on "Political Economy" in the Encyclopedia Britannica. Nearly all the United Irishmen were Protestants, such as Thomas Addis Emmet, of New York, and Dr. William J. McNevin, who are buried here in St. Paul's churchyard. The present leaders of the Gaelic movement are Protestants—Douglas Hyde, John Synge and Lady Gregory. The saddest thing about this demonstration is not the crazy threat of disloyal rebellion, for threats of pain and ruin one can afford to despise; it is the criminal kindling of religious hatred among citizens and Christians who were beginning to live as brethren.

Will they fight? Will they stand by their pledge? We cannot believe it. Ireland wants local government, and will have it. All American sentiment favors it, and all Canadian, all Australian, all South African. The opponents are fighting liberty and fighting the world. They cannot but fail. They must submit, they must consent, tho' vowing they will ne'er consent.

Ex-President Eliot's Political Choice

It is a very weighty communication which ex-President Eliot, returning from his peace mission in the far Orient, gives to the American people in the columns of the New York *Times*. He takes a large view, but we cannot accept all his conclusions, certainly not that which promises his vote to the candidate of the Democratic party.

He says there are two principal issues in this campaign, one the prompt and effective reduction of the high tariff and the other the extent to which the Constitution of the United States ought to be modified by interpretation or practice in order to deal with grave matters of reform; and on these two issues the three parties are divided. The Republican party, he tells us, is strongly protectionist, and is conservative on the constitutional issues; the Progressive party is also protectionist, but radical on the constitutional issues; while the Democratic party is "for a tariff for revenue, with no destructive immediate reductions," and on the constitutional question is more conservative than the Progressive party and less so than the Republican. Considering their personal qualities, he utterly distrusts Mr. Roosevelt, but is favorably disposed to both the other candidates. It is evidently the tariff issue that decides him in favor of the Democratic party rather than the Republican. The Progressive party he condemns on both counts; it is wrong on protection and rash and dangerous in its inconsiderate urgency for changes that should come deliberately and after experience.

It is on Mr. Eliot's conclusion as to the tariff issue that we take issue with him. We fail to see that there is any such difference between the two old parties on the reduction of the tariff as he discovers. The talk of protection and the talk of tariff for revenue should not deceive us; the thing to consider is, what concrete reduction do the two parties desire? The Republican party demands reduction within the limit of protection, and the Democratic party demands reduction so far as it will not hurt business. The difference is not patent, except in words. The academic debate divides the orators, but they approximate when they come to rates and figures. Nor is either party a unit. The insurgent Republicans would reduce sharply, where the Standpatters would reduce but moderately. The Democrats would reduce the wool tariff, but they want cotton and sugar protected. The two parties differ in the way of

reaching reduction; the Democrats would trust to the wisdom of the House, while the Republicans want a commission to study the cost of production at home and abroad and guide to a safe reduction. Both seek the same result. The Democratic House formulated special tariff bills affecting single products, and with amendments they past the Senate by Republican votes, but were vetoed by the President, not because they were too drastic, but because not properly considered. A careful study of the two parties gives no real preference on this subject to the Democratic party. Mr. Eliot says that "Governor Wilson advocates the immediate reduction of high tariff rates"; but this is exactly what President Taft and his party platform also ask.

When it comes to the discussion of the political and social reforms that may be related to constitutional interpretation, Mr. Eliot has no quarrel with President Taft or the Republican party. All his quarrel is with Mr. Roosevelt and Mr. Roosevelt's party. He simply thinks that there is more hope of accomplishing any reforms which both parties desire from Mr. Wilson than from Mr. Taft, perhaps because Mr. Wilson is more likely to have Congress behind him.

It is against Mr. Roosevelt and his party that the communication of the ex-President of Harvard is mainly directed. "The coming troublous years will call for fairness, sober judgment and quiet resolution in the executive head of the Government," and these, he says, are not Mr. Roosevelt's characteristics. At this particular juncture, when all the three parties are inclined to stretch the Constitution and invade the rights of the States, the President, he says, "ought not to be an impulsive, self-confident, headstrong man, impatient of restraints and opposition, and given to the use of extravagant language. Such a man is ex-President Roosevelt, as both his friends and his foes well know."

We have previously uttered an opinion that Mr. Roosevelt would be an unsafe man to be in power in such ticklish conditions as those we have lately seen in Mexico and Cuba. Bearing on war and peace Mr. Eliot speaks weightily:

"Moreover, ex-President Roosevelt has lately contributed by untimely criticisms, couched in intemperate language, to the defeat of the invaluable arbitration treaties of the United States with Great Britain and France, drawn by the Taft Administration, which would have made war between these countries well-nigh impossible. Holding the opinions he has often exprest about the beneficial effects of war on the individual and on society, he can manifestly be only a half-hearted believer in the judicial settlement of international disputes, and would probably prove a dangerous President, should questions of war arise. Yet international arbitration, justice and peace have long been, and are emphatically today, noble policies of the United States."

This is a matter of tremendous importance, and yet many are so shortsighted that only local or domestic questions concern them.

It stands thus, then, with the three ex-Presidents. Ex-President Eliot utterly distrusts ex-President Roosevelt. Ex-President Wilson he favors on the tariff issue, as against both President Taft and his predecessor.

A Historic Congress

THE Fifth International Congress of Chambers of Commerce, which met in Boston last week, was so much larger in attendance, in its scope and in its influence than its predecessors as to mark a new epoch in this important movement. The previous congresses have been in Liege, Milan, Prague and London, and all have been gatherings of high significance; but it is not too much to say that the congress in Boston last week was the most important commercial congress ever held. There were five hundred foreign delegates from about fifty countries, which means that the great commercial interests of the whole world were represented as never before. Held under the auspices of the Boston Chamber of Commerce, the attendance of representatives from our American commercial bodies was, of course, large; and the fact that we now have a national Chamber of Commerce was felt by all to be a most encouraging fact. The city of Boston and the State of Massachusetts contributed generously to the success of the congress; and it was opened by Secretary Nagel, of the national Department of Commerce, and President Taft spoke at the banquet. The discussions of dis-

tinctly industrial and commercial subjects were of the highest interest and value and of wide range. We emphasize here the remarkable significance of the congress in the promotion of international friendship and the cause of peace. "Trade means peace" was the word of President Taft at the banquet, which woke the most prolonged applause.

Readers of the reports of the Congress have noted the strain which repeatedly showed itself in the discussion of international arbitration, a strain so great that it precipitated more than once certain intemperate words which the judicious wished had been left unsaid. The strain, however, with its occasional froth, was witness to the wave of profound feeling which swept thru the Congress upon the subject of the supplanting of the war system of nations by judicial procedure in the settlement of international differences, and the fundamental importance of this, especially to the world's great commercial interests. The London Congress of 1910, that preceding the present Boston Congress, decided practically that the general subject of international arbitration and the establishment of the Court of Arbitral Justice should be upon the Boston program, and this decision was expressly confirmed by the permanent committee at its meeting just afterward in Paris. Devotion to this great cause was a primary motive with the Boston men who were most active in bringing the Congress here; and their disappointment was bitter when they found that by some subsequent action, learned here too late to revoke, the subject had been struck from the program by the permanent committee, and in its place a narrow proposition substituted relating simply to a class of cases of all cases the least likely ever to engage an international tribunal. The courteous president of the Congress, himself a strong peace man and a pronounced champion of international arbitration, assured the Boston men, however, that the broader subject should at least have a hearing; and its claims were briefly presented, without argument, by a member of the Boston program committee, Mr. Edwin D. Mead, on the first day of the Congress, with a simple resolution, pledging the endorsement by the Congress of international arbitration and the earliest possible establishment of the Court of Arbitral Justice approved by the last Hague Conference. There was keen and widespread disappointment when the president ruled that this and similar resolutions must go for consideration to the next Congress, two years hence; but the careful study of the permanent committee's rules showed the fair men of the Congress that the president's interpretation was in strictness correct. The feeling of the Congress, however, that it should not go out to the world that there was hesitancy or compromise in so representative and powerful a body upon the matter of arbitration and the Arbitral Court was so overwhelming, and the expression of it from every side so strong, that the president, M. Canon-Legrand, clearly saw that this was a case for no narrow application of technical rules. The American feeling was especially strong, as our Chambers of Commerce are practically a unit on the subject, 200 of them being regularly represented at the Mohonk conferences. The president, therefore, himself prepared a thorogoing and eloquent resolution covering the whole ground, which at the close of the regular business, in the closing session, he submitted to the Congress. He did it in a stirring speech, declaring his belief that in doing it he exprest the universal and commanding sentiment of the Congress as representing the commercial world. His resolution declared not only for the highest possible extension of international arbitration and the establishment of the court, but for the union of nations to avert the atrocity of war. French, English, German and American voices had seconded the resolution; and when the vote was past amidst tumultuous applause, all present rose to their feet in the inspiration of the moment, and many sprang to their chairs and waved their hats. It was the crowning moment of the greatest and most significant gathering of commercial men which has ever been held in human history; and its influence will be felt today and onward, as one eloquent speaker well declared, in every cabinet of the world.

The note sounded in this impressive manner by the president of the congress

in its closing hour was sounded with the same emphasis by President Taft in his noble speech at the banquet which followed, and by Mr. Begg, of the London Chamber of Commerce, whose eloquent address concluding the banquet program was one of the most remarkable in this remarkable week.

The promotion of the co-operation and friendship of the great commercial bodies of all nations, the advancement thruout the world of industry and trade of honor, integrity, high standards, good understanding and good will, these are the things which make these great international commercial congresses so beneficent and powerful. It is a good thing for the captains of industry and merchants of the world to get together to simplify and unify and make more intelligent their usages about checks, and bills of lading, and calendars, and systems of statistics, and all the rest; but far deeper than these things, and the sure guarantee that all these will be rightly and wisely settled in due time, is the feeling of mutual trust and common purpose and reciprocal service strengthened by such great gatherings as that which made the week memorable in Boston and thruout the commercial world.

Mormonism in Hawaii

Our Government has no quarrel with Mormonism, if it will only keep clear of polygamy. Since the Mormon Church has proclaimed its interdiction of plural marriage—and it has not been easy to prove that new ones have been contracted—our Government is indifferent to Mormonism as a religion, which has the full right of liberty accorded to every other faith however foolish. To be sure, certain old men have not put away their plural wives, and their polygamy may be illegal; but out of mercy to the women who were married when it was regarded as legal, they are not disturbed. The policy is much the same as the late decision which allows certain teachers in Indian schools still to wear their religious garb, tho against the regular rule.

But the conditions are different in Hawaii. There the Mormon propaganda has within a very few years showed great vigor and great success, not only among the easily influenced native Hawaiians, but even among Chinese, Japanese and Portuguese; and there the doctrine of polygamy is taught and practised. The Mormon missionaries began their labors among the natives in the more retired and rural sections, and the teachings as to the sanctity of the flesh were attractive to those who a hundred years ago, and some say as late as 1850, were living in a sort of free love society. The great majority of the voters are full-blooded natives or half white, and there is serious fear exprest that, with the very rapid spread of Mormonism, the islands may come to be controlled in its interests. We are assured that there have been hundreds of plural marriages performed or sanctioned by the elders. While at first not calling themselves Mormons, they have now come out openly and aggressively for Mormonism and polygamy, and have themselves married native women, while having wives in Utah or Idaho. From the natives the doctrine has spread to the Chinese, Japanese, and even to some extent to the Portuguese and Russian plantation laborers, as reported by Bishop Willis, of the Episcopal Church. The Catholic Bishop Libert says that the Mormon missionaries limit the number of wives a man may have to his ability to support them. "In the remote districts," he reports, "where women as well as men work in the fields, raise taro, make mats and brooms and curios, it is very easy for a man to figure out that the number of wives he may possess is limited only by the number of women who will consent to live in his house; for they do not pretend, as in Utah, Idaho and Wyoming, to have a separate house for each wife, but herd them together like concubines."

Of course, the laws against polygamy can be and should be enforced in Hawaii. Indeed, appeal has been made to the Government to investigate the conditions and see that polygamy be not allowed. We learn that a number of officers have been sent to Hawaii to investigate and report with a view to indictments for violation of United States law.

But of quite as much importance is the fact that the religious forces in the islands have waked up to the danger and

duty, and are uniting in the work of arresting the progress of Mormonism among the natives and the Orientals, who number three-fourths of the population. We see there the Catholic priests uniting with the federation of Protestant denominations in the effort to drive the Mormon Church out of Hawaii; for, while the Government is concerned only with polygamy, Christianity finds in Mormonism a perversion both of religion and morals and a bogus revelation.

The International Congress of Hygiene

THE presence in Washington last week of many hundreds of delegates from the civilized countries of the world and of representative scientists who have come because of their interest in the proceedings of the Fifteenth International Congress of Hygiene and Demography is a striking testimonial to the feeling of brotherhood among the nations that has been growing during the past generation. These men are met in order to discuss disease, its origin and prevention, and, above all, to decide upon what measures are necessary in order to prevent the spread of disease from one country to another. The successive sessions of this congress have always added new features to international quarantine and led to the establishment of measures that make it more nearly impossible for epidemic disease to spread in the great pandemic way that was not only possible, but apparently inevitable in the olden time. If we have been able to keep plague under control, and in spite of the fact that it has found its way into the pathway of commerce a number of times in the past twenty years, have yet been able to prevent its becoming epidemic to any serious extent in any civilized country, it is largely because of the sanitary relations between the nations that have been fostered by the meetings of this International Congress of Hygiene.

There are many who seem to think now that it would be quite impossible for nations to come to amicable agreement on matters affecting vitally national interests, but even a little more than a generation ago there were many people who would have been quite sure that any such international amity as is so well exprest by this international congress could not be possible. Nations cared for their own people to some extent in times of epidemic, but other nations might look out for themselves. The idea of taking special precautions to prevent other peoples from becoming infected, or giving such information as would help other nations to protect themselves would have seemed an impossible climax of altruism. All this has come, however, and further developments are in progress until the whole question of disease prevention is now being treated by the scientific intellect of the world as essentially an international or world problem and not at all to be considered within the narrow bounds of nationality. Surely here is the promise that other vital questions relating to humanity will yet be treated in this same broad way.

The present international congress has not been noted for the presentation of any great original discoveries, tho it will doubtless go down into history as having brought out a series of the most interesting and important discussions of great problems of health that have ever been made. The newspapers have exploited mainly certain sensational features and, unfortunately, have quoted more from those who write deliberately to attract public attention and have long studied how to do so, than from those who had serious messages for the members of the congress and delivered them in a calm and scientific way.

The nearest thing to a sensation was the announcement that Prof. Jacques Loeb was to exhibit a "fatherless frog." It was said that he had succeeded in causing certain of the ova of the frog to develop without the process of fecundation. Whether that was accomplished or not must be left to the decision of scientists who make control observations and experiments. The sensational significance attributed to it as a sort of creation of life is, of course, only newspaper talk. Certain of the lower orders of animal life produce some generations parthenogenetically, that is, without the necessity for fecundation. Occasionally under special circumstances partheno-

genesis, to some extent at least, may occur higher up in the scale and certain tumors even in human beings seem to represent a definite tendency toward such a manifestation. Under special conditions of irritation the occurrence of development from unfecundated ova may mean very little. What it does mean will have to be determined. It is not spontaneous generation, tho even if it were, as every one accepted spontaneous generation until about half a century ago it surely need not disturb conservative philosophic thinking or concepts of the origin of life, tho sensational reports would often seem to indicate that it must have some such effect.

Probably the most interesting popular phase of discussion at the congress concerned nutrition. In this nature was hailed as the best possible guide. Specialists in children's diseases from many parts of the world insisted that in spite of the most careful study of artificial food for infants the natural food was immeasurably superior, and the best possible safeguard for the health of the child. Everywhere maternal feeding has declined under the influence of social and economic circumstances, but everywhere this decline has been followed by a large increase in the death rate among small children. At least three times as many children die under the age of a year when they are artificially fed as when they are nourished in the natural way. Discussions as to food preservatives seem to show that, while harmful preservatives must be avoided, there are many chemical ways of preserving food that are to be looked on as harmless. We know now that grandmother's use of spices was really antiseptic in quality. Salt and saltpeter and vinegar were preservatives that in excess might well disturb health. There are probably other preservatives that may be used without danger. Some problems thought settled in this line were reopened once more. As proper food preservation makes for economy and lessens the cost of living, the subject deserves all the study that has been given to it.

This congress probably represents the end of all formal distinction between infection and contagion. Infectious diseases are not conveyed by the air, nor meteorological conditions, nor emanations from the earth in certain places, but are transferred from one person to another by contact, direct or indirect. The subject of the carriers of disease was thoroly discussed. The mosquito, the fly, the flea, the tick, rodents as intermediate hosts, various other animals as mediate agents, and then human beings themselves as carriers of disease were all subjects of discussion. When disease is transferred from one person to another there is nearly always one of these animate carriers or there is at least indirect contact between the first and the second patient. Diphtheria does not get into the air any more than malaria occurs in the night air near swamps, but there are certain carriers of the disease often themselves not affected by it or having acquired immunity thru a preceding attack who unwittingly transfer it to others and who must be cared for in order to prevent this transferrence.

A striking element in the discussions of the congress was what may be called the relations of disease and sin. There has come a practically universal recognition of the fact that, while many of the moral obliquities of mankind are due to diseased nervous systems, either acquired or congenital, on the other hand much of human ailment is the effect of departure from moral law. Excesses of various kinds, especially alcoholic and venereal, are the fruitful source of much human disease. There was, besides, the recognition that physicians interested in the welfare of the race must seriously take up the problem of helping in every way to lessen such excesses, since this is an important factor in prophylaxis. There were discussions in the congress that were distinctly ethical as well as medical and that could scarcely fail to produce the feeling that there is to be broad cooperation on scientific lines for the preservation of humanity from the ills, moral and physical, so inextricably connected together, to which the race is liable. The symbol of universal brotherhood and the wise charitableness that were first and last the keynotes of the congress are happy expressions of the place that it has come to occupy in the world of today.

Logographs

THE forty thousandth number of the London *Times,* published September 10, is bigger than a book. In fact, it contains as much printed matter as six ordinary novels and would be well worth keeping on the bookshelf as a reference work on journalism were it not for its impossible format, as awkward as that of THE INDEPENDENT sixty years ago. It contains a series of authoritative articles on the history of the printing art, from the earliest times to the present, with particular reference to the development of modern processes of typesetting, presswork and illustration.

In all of it there is nothing more curious than the history of the *Times* itself, for this staid and conservative journal had its origin in a freak invention that did not work and yet was in some respects an anticipation of the latest advance in the art of printing, the use of slugs containing more than one letter. If it had not been for the American Revolution there would have been no London *Times,* for it was the capture of homeward bound West India fleets by our privateers in 1776 that caused the bankruptcy of John Walter, who had insured them. Walter then in search of a new job became interested in "Logography or the Art of Arranging and Composing for Printing with Words intire, their Radices and Terminations instead of Single Letters." He wrote to Benjamin Franklin about it and received an encouraging reply, from which we must quote a sentence, for it shows that the printer-statesman had already been experimenting in this line and had come near to the discovery of the linotype, a hundred years ahead of time:

"SIR—I have received a book, for which I understand I am obliged to you 'The Introduction to Logography.' I have read it with attention, and, as far as I understand it, am much pleased with it. I do not perfectly comprehend the arrangement of the cases, but the reduction of the number of pieces, by the roots of words, and their different terminations, is extremely ingenious, and I like much the idea of cementing the letters, instead of casting words or syllables, which I formerly attempted, and succeeded in; having invented a mould and method, by which I could in a few minutes form a matrice, and adjust it to any word in any fount, at pleasure, and proceed to cast from it. I send enclosed a specimen of some of my terminations, and would willingly instruct you in the method if you desire it—but I think you have a better."

With his font of logotypes as parts of words commonly used, 1,500 in number, Walter started *The Daily Weekly Register* on January 1, 1785, which three years afterwards changed its name to the *Times.* A year or two later the logographic process was abandoned, doubtless because it was found that the handling of such a large "case" was too much trouble.

But the progress of invention is often by cycles, and earlier and discarded forms are apt later to reappear. The first bicycles had wheels of equal size, but the front one grew larger and the hind one smaller until we had the treacherous monstrosity of the eighties. Now we have again an equal wheeled bicycle that looks very much like the primitive machine, prematurely called a "velocipede," which the rider pushed along by kicking the ground with his toes. The first locomotives ran on the common road. Then they took to the rails and stuck to them till men forgot that they had ever traveled otherwise. Now with more powerful engines and rubber tires they reappear upon the highway as automobiles. So now the ambitions of the first John Walter have been more than realized, for the *Times,* like other papers, is printed, not from logotypes of a few letters cemented together as it was at first, not from separate little types as it was later, but from strips of metal comprising an entire line of eight words or so. These are cast for the occasion by the monotype or linotype from matrices set up by striking the individual letters on a keyboard like a typewriter.

But the *Times* has evidently not altogether lost faith in its original idea of the utility of combining certain letters, for it makes the interesting suggestion that new letters should be invented to stand for the sounds not represented in our alphabet, "th" and "ng." To make room for them it advises the discarding of the unnecessary logotypes "ffi" and "ffl" now in use. These have no real value, and except for custom the separate letters look just as well. We get along without them on the typewriter and do not mind it. The "th" sound is not a

combination of the sounds "t" and "h," but something quite independent, and should have a single character of its own, like the Anglo-Saxon *thom* and the Greek *theta*. In this new alphabet of twenty-eight letters the "th" would rank eleventh in order of demand, and "ng" twenty-third, being more often used than k, q, x, j or z.

The introduction of these two characters would effect a saving of about 3½ per cent. in all writing, typewriting, printing and reading, that is, or ten days' labor and expense of composition to every daily paper in the year. The total economy for the English-speaking world in writing and printing resulting from this simplification of spelling would, according to the *Times*, amount to $1,750,000 a year for the British Empire and United States altogether, an economy worth while in these days of high living.

But our readers need not be alarmed at the prospect of being confronted by two new letters. In this reform we will leave it to our esteemed and conservative contemporary of London to take the first step toward carrying into effect its admirable suggestion.

The Single Tax

Some idea of the growth of interest in the single tax may be gathered from recalling that there is a straight-out single tax amendment pending in Missouri, proposed by initiative petition. This will be voted on in November. It provides for the immediate abolition of personal property taxes and a gradual reduction of taxes on buildings so that in about eight years the whole burden will be upon the value of land and franchises of public service corporations. The amendment also permits privilege and inheritance taxes. In Oregon initiative petitions have been filed in three counties under the provisions of a constitutional amendment adopted two years ago. These provide in effect for raising all county and municipal revenue from land values. There is also an amendment pending for a graduated specific tax on values of land and franchises in excess of $10,000 in one ownership and in one county, and this amendment has also a clause which will abolish all taxes except that on land values for county and municipal purposes, except when the people shall specifically vote a local tax law at a general or special election to tax other property. This is a State-wide provision. This amendment and the three county exemption bills will all be voted on in November. The Province of Alberta, in Canada, in February last went to a single tax basis for all local revenues, except in the cities which are governed by home rule charters. Most of these cities, however, are raising their revenues in this manner. In Seattle a charter amendment providing for the single tax was defeated last year, but is being agitated again and will probably be placed upon the ballot next year by initiative petition. At the same election when this amendment was defeated, one of its strongest advocates was elected mayor.

Legal Reforms

Reforms in legal procedure, which are urged by Mr. Moorfield Storey in his book on that subject, recently reviewed in our columns, are embodied in bills recommended by the American Bar Association at its meeting last August, and now before Congress. One of these bills provides that judgment shall be given upon the merits without regard to technical errors which do not affect the merits. This has been reported favorably in both houses, but has not been acted upon. A bill providing that equitable defenses may be set up in actions at law and that a suitor shall not be dismissed because his action is brought at law when it should have been brought in equity, or vice versa, has past the Senate and is now before the House. A bill permitting a review in the Supreme Court of decisions of the highest court in a State, when the judgment is against the validity of an act of the State legislature, has also past the Senate and is now before the House. Had this bill become a law before the decision in the Ives case it would have allowed a review of that unfortunate decision by the Supreme Court of the United States. These bills, if past, will do much to remove the defects in our legal procedure, which have caused so much criticism—more or less exaggerated, it is true, but having very solid foundation in fact.

The Centennial of Emancipation

A correspondent heartily approves the plan for the celebration by the negroes of the semi-centennial of emancipation; but he asks in wonder why the white citizens should not join in a wider celebration of Lincoln's momentous proclamation. That proclamation made a new nation. It perpetuated the Union. It prevented our breaking up into a number of hostile divisions, sure to break out into bitter wars. It gave us a nation truly consecrated to freedom, and worthy of the sacrifices of the fathers and their sons who died in the mighty conflict. The white people, even more than the colored people, for there are nine times as many of them, should celebrate the most important event in our modern history. And particularly the white people of the old Confederate South should celebrate this fiftieth anniversary. It was a chief blessing to them. They all agree now that slavery was a burden, a millstone about their necks, and that the victory of union and freedom has been an untold blessing to them. There is no public voice to deny this. Thus it would seem that the white people of the South, who are its leading people, should take the lead in this celebration. Why should they leave it to the freedmen and their children, who are less able worthily to celebrate the event which is a common and mutual blessing and is freely acknowledged as such? It is not enough that occasionally and guardedly here and there a white man should accept an invitation to utter a kindly word at a celebration conducted by the emancipated race. Both races were emancipated.

Reform of the Calendar

The reform of the calendar is very much needed, even altho we have for so long a time got along with months of various lengths and weeks in no way aligned to the months, so that everybody has every day to look to his almanac or newspaper to be sure what day of the month it is. To harmonize months and weeks is a difficult problem, and no better one has been devised than that presented to the International Congress of the Chambers of Commerce, at its meeting in Boston last week, by its president, Louis Cannon LeGrand, and approved by the congress. And yet it is not quite ideal. The year has 365 days, or one day over fifty-two weeks. He would take New Year's Day out of the reckoning of both weeks and months, making it intercalary, and the year could then be divided into four quarters, each of thirteen weeks. That might do if we gave up the months entirely and numbered the days consecutively for the thirteen weeks; but the thirteen weeks cannot be divided evenly into three months. To get the same number of days in the twelve months we should have to intercalate five days instead of one, and then the months would not begin with the same day of the week. In order to divide the year so as to have the months begin with the same day of the week, we should have to divide the year into thirteen months of twenty-eight days each, and then intercalate New Year's day as a *dies non*, as suggested by Mr. LeGrand. But his proposal, or that for thirteen weeks, would find serious objections from both Jews and Christians, as its New Year's day would add an extra day between Sundays, altho probably that could be allowed, either by assuming that New Year's would be an added day of rest, or by considering the Lord's Day as not the binding Jewish Sabbath of the Fourth Commandment. We do not anticipate any speedy change.

The Cost of Books

Some people buy books by the pound, hefting the volume in the hand to see if it is worth the money. Some buy by the cubic inch, sizing up the volume with the eye, in comparison with a dollar bill. But the book publisher knows how to catch both customers; the first by weighting his paper with kaolin until it feels as if bound in lead, the second by using a paper light and thick as a blotter, which deceives the purchaser into thinking that he had reading matter enough to last a month, only to find that he runs out on the second night with nothing else in the house except Shakespeare and the Bible. The publishers are getting so ingenious and unprincipled nowadays that they will take a popular short story that has appeared

with half a dozen others in some 15-cent magazine and put it out in a book form as big and imposing as a novel by William De Morgan or Arnold Bennett, and sell it for about as much. The only safe way is to count the number of words before purchasing, but this takes time and keeps other customers waiting at the book counter. Readers anxious to get their money's worth will therefore appreciate the new feature of the monthly *Book Review Digest* of Minneapolis in giving the cost per thousand words of all books as they are published. From a hasty calculation of recent numbers we find that fiction is about the cheapest form of intellectual fodder on the market; we are of course merely referring to the price. The current rate is pretty uniform between 1½ and 2 cents per thousand words. History, economics, politics and popular science show more variation, but average 2 cents per thousand. Religion, essays, biography and literary criticism run higher, 2.6 cents on the average. Travel is more costly, even when you do it at home, 3 cents a thousand and often much more. Of course, this is to be expected, since these books are often heavily illustrated, but they are often unnecessarily padded out, too. Poetry is the most expensive form of literature, to the purchaser certainly and usually also to the author. There is no standard market rate and the prices range anywhere from 4 to 15 cents per thousand words. Even at that high price there is not much demand for it. By careful perusal of these monthly quotations of the price current for printed words the economical reader may cut down his book bills considerably, unless, of course, he is particular about what he reads and takes into consideration quality as well as quantity. If he is we suggest that he take into consideration THE INDEPENDENT, which sells words hot off the griddle at 1½ mills per thousand, and a mill is the tenth of a cent.

Food for Birds

Bird Lore for August gives an immensely useful list of trees that can be planted to encourage and feed the useful birds. This list includes the Virginia creeper, the bittersweet, the cranberry and buckthorn and sumach and cornels, and the spice bush and shad bush and barberry. These among the bushes and vines. The blackberries and elderberries and snowberries and high-bush cranberry, as well as the blueberries, all these feed the birds, and they are all useful in our shrubberies or about our buildings. The wild grapes are particularly useful. Then we have the mountain ash and chokeberries and bird cherries and mulberries, as well as the red bud and thorns and hazels among our trees. Of herbaceous plants there are the strawberry and sunflower and pokeberry and wild buckwheat. It is well worth while for our farmers to know what will serve as bird food, and in their trimmings and plantings they can use many of them for windbreaks and hedges. One of the best hedge plants we have is Tartarian honeysuckle, and this makes one of the best plants to furnish bird food that is known. We hear from all sides that the robins are decreasing. This is due largely, no doubt, to the fact that in their migration they are being murdered by the thousands by sportsmen, while other thousands are eaten by the blacks and the whites of the Southern States. Fortunately, it takes "a dozen at a meal" for a hearty Cracker, and he gets discouraged in his hunt for numbers. Every robin lover should count them into his family, and furnish food as systematically as for his cattle and dogs. A true farm home is a bird paradise, where the catbirds and thrushes and bluebirds and indigo birds and cardinal birds will happily make their homes. Then in the fall the seed eaters should be just as welcome, for they are quite as useful in destroying the seeds of noxious weeds. We should like to waken up our American country home lovers to the fact that without birds the country home cannot be successful, either in orchard or garden.

The United States Bureau of Education brings out in a bulletin, but with statistics, a fact perfectly familiar, that the percentage of graduates of our colleges who enter the ministry has greatly and progressively declined in the last hundred years. Of course it has, and why not? It is a most favorable indica-

tion of general intelligence, not that fewer are entering the ministry, for they are not, but that more doctors and lawyers and teachers and especially business men are seeking a wider education. We take no stock in the complaint that there are few candidates for the ministry. The theological seminaries are opening with larger classes. We hear no complaint that there are not pastors enough for our too numerous churches. The only fear is that, with the louder call of business and other professions, the average quality of the ministry may fall; but there is no evidence of it as yet, if we may trust the judgment of the teachers in the seminaries.

For the sole representative in Congress of the Socialist party, which he says will cast 2,000,000 votes next November, Victor Berger is in good spirits . The two old parties, he says, have no principles and are disintegrating. They differ only in words as to the tariff. "Tariff for revenue only" is, he says, the "most unjust and most stupid of all tariffs, because it puts the burden of taxation on those who can least afford it"; and then the Democrats say they do not wish to reduce so as to harm any industry, which "makes the plank simply ridiculous." The candidates he dismisses curtly, Mr. Taft as having "no executive ability"; Mr. Roosevelt as a scatterbrain who can change his principles any afternoon; and Governor Wilson as a schoolmaster whose published writings will antagonize to him trade unionists, Roman Catholics, immigrants and moderate drinkers. Only the Socialist party has a future.

There is no question that Mr. Roosevelt is throwing overboard the Southern negro. He does not want his vote, for what he seeks in his present Southern tour is to break up the white South and get white Southern votes. Colored Southern votes would be no aid to him. So in his vigorous and able address in New Orleans he gave his friendly hearers to understand that he sympathized with them in the reasons why they had allowed but one party, and that the Democratic. But now, he would have them allow, the negro danger is past, and they can afford to divide into two parties, two white parties. Hitherto they have had to be Democrats to maintain white supremacy; they now have to no more. Now they can consider their own interests, which are not those of the party which would not give protection to Louisiana's sugar. Mr. Roosevelt wants no Southern negro votes, as he wanted no Southern negro delegates at Chicago.

The following is the first of five stanzas of "The Hymn of Armageddon," credited in *The International* to George S. Viereck:

"Apocalyptic thunders roll out of the crimson east:
The Day of Judgment is at hand, and we shall slay the Beast.
What are the seven heads of him, the Beast that shall be slain?
Sullivan, Taggart, Lorimer, Barnes, Penrose, Murphy, Crane.
Into what cities leads his trail in venom steeped in gore?
Ask Frisco, ask Chicago, mark New York and Baltimore.
Where shall we wage the battle, for whom unsheath the sword?
We stand at Armageddon and we battle for the Lord!

And this is supposed to be poetry. We imagine it sung at the Roosevelt meetings. These lists of names somehow lack the rhythm of Homer's catalog of ships.

It is not so very surprising that Mr. Roosevelt finds Louisiana against the negro in politics. It means to keep him out if he can be kept illiterate. These are the facts about Lafayette Parish. It has a negro population of 15,000, and it has but one public school for negroes. Of 6.273 negroes over ten years of age, 5,387 could neither read nor write. Of 1,742 over twenty-one years of age, 1,487 were quite illiterate, and 252 who could read very imperfectly. There were 2,686 children of school age, and only 253 in the one school in the parish, what elsewhere is called a county. Such a condition is a burning disgrace.

In his monthly leading political article in the *North American Review*, Colonel Harvey, its editor, in the October number undertakes to show, or assert, that the election of Mr. Roosevelt would se-

riously endanger the maintenance of the republic. One who believes that the issue before the people in November is, as he says, "Roosevelt or the Republic," does well to publish the warning, if he has the journal to print it in; but we do not see the consistency of his language in speaking of the record of Mr. Roosevelt's career in the past. He says of it, "We are deterred from painting the picture in historic detail by a sense of shame"; and then he proceeds to tell it not in detail and with no sense of shame:

"Roosevelt was the first President whose chief personal characteristic was mendacity, the first to glory in duplicity, the first braggart, the first bully, the first betrayer of a friend who ever occupied the White House";

and so on for pages. Is such language decent? And is the republic so flimsy?

Mr. Trissel, editor of the San Juan *Times,* who is now visiting this country, says in an interview:

"The sentiment in Porto Rico is overwhelmingly in favor of citizenship for the island, which would ultimately lead to Statehood."

We are glad to see this statement, which presents the policy which we have ever urged. We have constantly declared that Porto Rico must ultimately become a State, but we have had few to support us. Now Porto Rico demands citizenship as the first step. President Taft sent a special message to Congress asking for it, and the House voted it, but the bill lay dormant in the Senate committee. Senator Lorimer was chairman and he was busy with his own defense. Now that he is out we trust the Senate will do justice.

Secretary Ballinger left the Cabinet none too soon, and at last Mr. Pinchot and his associates are justified by the decision of the Secretary of the Interior, who has canceled the Cunningham claims in Alaska, and says they were "improperly allowed." They were a fraud and a steal, and the lands and mines are saved for the people. But for such men as Pinchot and Brandeis the steal would have been a success.

We regret the action of the Philadelphia Board of Public Education, which has sent word to private schools whose pupils have been admitted to the Normal School that henceforth their pupils will not be received, as the building will not accommodate all who apply from the high schools of the city. Then it should be enlarged, or an annex rented. It looks like an unhappy discrimination, possibly a religious one. If only a limited number can be received, why not provide a competitive examination?

What modern China thinks of other countries may perhaps be judged from the decision to send sixty-two students abroad to study separate subjects Of these eight are to study naval matters in England, eight military matters in Germany, twenty mineralogy in Belgium, ten industry in the United States, eight law in France, and eight mathematics in Italy.

The New Orleans *Picayune* says:

"Altho Louisiana is stanchly Democratic, she cannot for an instant contemplate the removal of the tariff on sugar, or even its revision, without serious alarm. The sugar industry in this State has grown up under the assistance afforded by the tariff for several generations. . . . The constant agitation of the matter is therefore extremely harmful and President Taft was eminently wise in holding that all tariff problems should be eliminated from politics."

What is a Democrat anyhow?

The International Workers of the World, the radical, syndicalist body, have a song-book of whose poetry and spirit the following is a sample:

"Long-haired preachers come out every night,
Try to tell you what's wrong and what's right,
But when asked how about something to eat,
They will answer with voices so sweet:
You will eat by and by
In that glorious land above the sky.
Work and pray, live on hay,
You'll get pie in the sky when you die."

Somehow they manage to sing it.

Why was it that the Tertiary period produced such an extraordinary number of enormous animals? It was because of the superabundance of food for them. Well-fed races grow large; ill-fed races or communities are small. Children stinted in food will be stunted in growth. Having learned this, Germany gives a hearty meal to her school children.

INSURANCE

The Middleman's Profit

In The Independent of August 8 last, discussing the expense element incident to the transaction of the fire insurance business, quoting the official figures compiled by the Insurance Department of New York for 1911, which show that the middlemen received during that year a sum equal to 23.1 per cent. of the premiums handled, we stated that it was unreasonable this service should absorb 23 cents of every dollar of the premium paid by the buyers of the protection, and that in this feature of the matter there was much room for reform. Our view of the situation has challenged the attention of Mr. Russell M. L. Carson, secretary of the insurance, real estate and investment firm of Charles H. Carson Company, Glens Falls, N. Y. As a local fire insurance agent, Mr. Carson admittedly possesses an intimate knowledge of the conditions discussed in our article, and his opinions are both interesting and valuable. For that reason, and because we desire to present his views in full, we print his letter without abridgement, reserving for next week's issue such consideration as we purpose giving it. Mr. Carson's letter follows:

"Enclosed is a clipping from the *Review*, a weekly insurance and finance journal published by *The Journal of Commerce and Commercial Bulletin*, which presents the other side of the question discussed in the August 8, 1912, number of The Independent under the heading 'Expense Factor In Fire Insurance,' with which I disagreed mentally on a number of its conclusions at the time of reading and which was recalled to mind when I saw Mr. Kiernan's statement in the *Review*. As a subscriber and interested reader of the Independent I venture to call my own opinions to your attention.

"Your article stated that by buying insurance direct from the companies the public could save at least twenty per cent. of the present cost. Such a conclusion can only be arrived at from a theory that the only function of an agent is to issue policies, collect the premiums and pocket the profits. Those are among the duties of every agent, but if his duty (directly to his companies and indirectly to the public) ended there he would write a policy for every application and if possible insure to the limit and beyond, with a resulting increase of loss ratio to his companies and increase of rates to the public. How much better off would a company writing business over the entire United States be, if it had no agents to judge the moral and physical hazards of the risks it was writing, than if it had agents with such a limited idea of their duties? One of the most important functions of the insurance agents of today is to so carefully select the business that he is turning in to his companies that no assured, particularly if of questionable honesty or reputation, can have an object from an insurance standpoint to wish his property to burn. Without the agent as a watch dog over the loss ratio, rates must go up, not come down.

"Secondly, would it not be impossible for the average business man to give the time necessary to master all the details of the insurance business to such an extent that he could competently place his business with a company many miles away which had no direct knowledge of the conditions that should be provided for. The writer has been in this business for ten years and he is, after having given most of his time to that subject for that period, learning things every year that he had not known before. If the writer of your article had ever worked in an insurance office and tried to arrange with a customer by mail the placing of a line that had an unusual feature or two, he never would have written as he did.

"In regard to rates of commission, our agency is in a city of about 17,000 population and we write business outside in a territory bounded by a limit of about sixty miles from home. By using an automobile we can keep in close touch with that size field. We receive from our companies a graded commission of fifteen per cent., twenty per cent. and twenty-five per cent. Our average monthly commission has never exceeded .1966 and has not fallen below .1809 as far as my records at hand go. Our business is an average business and our commission scale the same as is generally paid in New York State except in a few of the larger cities. After office rent, clerk hire, automobile expense and the many expenses incidental to the business are paid, we are lucky if ten per cent. is left to us, and ten per cent. is little more than a living wage. There are mighty few agents in New York State who are averaging twenty-three per cent. in commissions and even with those who do get it it does not represent twenty-three cents on the dollar going to the pockets of the middlemen, for the expenses of the agency, and they are heavy, have to come out. I do not believe commissions can be reduced to any extent without driving the better class of agents out of the business. And if the better agents are driven out the increased loss ratio and resultant rate increase will cause the public to pay more for its insurance than it pays with the present rate of compensation to agents. I heartily endorse Mr. Kiernan's statements and believe you will find the right is on his side of the question, namely, that the value of an agent's services should be measured in a large degree by the costs which that agent has to meet in order to give the required service.

Russell M. L. Carson."

FINANCIAL

Bond Investments

For more than three-quarters of a century—almost, in fact, since there have been railroads—bonds secured by a mortgage on railway property have been the leading form of investment security. Government bonds, municipal bonds, bonds issued by public service corporations—by these and a number of other different kinds of securities the investment leadership of railroad mortgage bonds has at various times been challenged. But no less today than ever is the railroad bond the standard security, the backlog of the public's investment in corporate securities.

We are today in the midst of one of those times when the leadership of the four per cent. railroad bond is being challenged. The cost of living has gone up and investors are demanding a higher rate of income from the securities they buy. The old, solid, first-mortgage railroad bond yielding only a little more than four per cent. was all very well, we are told, when the dollar went thirty or forty per cent. further than it goes at present. But now that prices have risen so, the argument runs, it is different. Investors have got to have something which will yield them a better rate of income. The old-fashioned first mortgage railroad bond will no longer do. It was all very well in its time, but it has outlived its usefulness. Its day is past.

Look at the way prices of securities of this class have been declining, say the advocates of this theory. Take the average of twenty or twenty-five representative issues and compare it with the prices of these same bonds six or eight years ago. What is found? A decline of just about as many points—an average decline of fully a point a year.

Now it is perfectly true that investors' selling of high-grade railroad bonds, forced by the rise in the cost of living, has resulted in materially lowering the price-level of issues of this sort. It is quite true that thousands of investors all over the country are straying from the way of the four per cent. bond and are putting their money into all sorts of securities yielding much higher rates of income. But that in itself by no means proves that the day of the four per cent. bond is over. We have had these same selling movements before, with the same effect on prices. In the past this effect has always been temporary and followed by recovery. Is there reason for believing that this will be the case this time?

There is, and it is a simple matter of demand and supply. The amount of bonds of this sort is limited, not many railroads being in a position to issue them. Additions to the amount outstanding are very moderate—less, probably, than the amount of those which come due each year and are paid off.

The demand for bonds of this kind, on the other hand, is, in spite of the unwillingness on the part of investors to buy them, steadily on the increase. They fulfill an investment function—that of a backlog—as no other security can fulfill it. They are needed by business houses having accumulated profits, by banks, trust companies and other institutions—and on an increasingly large scale. Buying from these sources is in far larger volume than it used to be. And it is growing all the time.

For the time being, selling by individual investors has nullified this influence so completely as to cause a good many people to lose sight of the fact that it is operative at all. Under the surface, however, absorption of the limited floating supply of bonds of this sort is steadily going on. Some day the individual investor will wake up to this fact and decide to hold on to his old-fashioned bonds a while longer. And that will be when the scarcity will become apparent and the recovery will begin.

....It has been decided that the New York, New Haven & Hartford Railroad Company's line from Boston to Providence shall be fitted with electric power and four-tracked without delay. Probably the work will be finished next year. All grade crossings will be eliminated.

....Our exports of sewing machines in the last fiscal year were about $10,000,000. Exports of such machines since 1900 have amounted to $80,000,000. Nearly half of them are sold in Europe.

The Independent

VOL. LXXIII NEW YORK, THURSDAY, OCTOBER 10, 1912 No. 3332

Survey of the World

Mr. Roosevelt Testifies

Theodore Roosevelt was on October 4 a witness before the Senatorial committee investigating campaign contributions. He denied that he asked the late E. H. Harriman to raise money for the party in 1904; denied that he knew until October 3 that Standard Oil money had been contributed in that year, and denied prior knowledge of contributions by Messrs. Gould and Morgan. Messrs. Roosevelt and McHarg both denied that the latter was sent South this year to buy up delegates to the Republican convention. Mr. Roosevelt sent for Harriman and Morgan in the fall of 1904, he said, but not to discuss politics. The contribution by Mr. Frick he knew about, but that did not disturb him. Nor did he regard Mr. Morgan's $150,000 as of greater consequence than $1 sent to him this year by a veteran in a soldiers' home. Mr. Harriman came to him in 1904 to ask his help in New York; he had never asked favors of the railway man. Mr. Roosevelt testified two hours in the morning, two hours and a half in the afternoon. Certain points in the ex-President's testimony were corroborated by his former secretary, William Loeb, Jr. He read a letter which he wrote from Oyster Bay to Mr. Sheldon, Republican treasurer, on September 21, 1908, advising against accepting contributions from Mr. Archbold or Mr. Harriman to Mr. Taft's campaign. When asked by Senator Paynter whether, as a "practical" man, he did not think some of the contributions by corporations to his own 1904 campaign were made with the expectation that the corporations would receive favors, Mr. Roosevelt elicited applause by replying:

> "As a practical man of high ideals, who has always endeavored to put his high ideals into practice, I think any man who would believe that he would get any consideration from making any contribution to me was either a crook or a fool."

Senator Dixon having complained that the investigation in progress is unfair to Mr. Roosevelt and his party, Mr. Roosevelt, with greater mildness than Dixon, repeated the complaint. He should have been called sooner, he said, and not thirty days before election. It happens that the chairman af the investigating committee—Senator Moses Clapp—is himself a Roosevelt supporter. The Roosevelt press regards the hearing as a "magnificent vindication." The New York *Press*, recently purchased by Mr. Munsey, says:

> "Roosevelt prepared his alibis as he went along, so that when the time came he could show that he had ordered the return of any protection money he knew about."

More About 1904

The former treasurer of the Republican National Committee, George R. Sheldon, testified last week that corporations contributed 73½ per cent. of the Republican campaign fund in 1904. This fund amounted to $3,500,000. The Standard Oil gave $100,000; George J. Gould the same amount; the Steel Corporation $10,000. J. P. Morgan subscribed $100,000, but later added $50,000, which he thought was spent wholly or largely in New York, as a part of the $240,000 which Mr. Harriman raised, a week before election, Harriman himself giving $50,000. "There was no limit to the amount they would take,"

said Mr. Morgan, smiling. The banker also stated that his money had never been declined by a political organization. In 1908 he gave $20,000 to the Republican fund.

This Year's Expenditures On October 1 the Clapp Committee of the Senate learned that over $325,000 was spent in Mr. Roosevelt's pre-convention campaign in Pennsylvania and New York County alone. The national organization spent $143,999 more. No figures are available for many States. William Flinn has spent at least $144,308 on politics since the beginning of the year, and Mr. Perkins's pre-convention contribution was $37,500. Mr. Munsey follows with $33,000; Dan Hanna with $25,000. Other names on the list are Oscar Straus, Progressive nominee for Governor of New York, and Richard R. Quay, son of the late boss. Mr. Flinn intimated that the sums disbursed this year in Pennsylvania were smaller than in earlier years. He said that he and Senator Oliver spent $110,000 in the 1906 State campaign, and told how he had developed from a Republican machine man into a Progressive leader; he had seen a great light. Senator Pomerene, of Ohio, a Democratic member of the committee, then introduced into the evidence a document which the Pittsburgh leader acknowledged: a proposed agreement with the late Senator Quay by which he handed over his Congressmen and Alleghany County State legislators in exchange for Quay's influence in favor of Flinn's interests as a municipal contractor. Mr. Flinn said that he had devised the contract as a "gold brick": he had not intended to keep to his bargain. —— Testimony in regard to the campaign funds was offered by Elon H. Hooker, treasurer of the Progressive party. He alleged that Mr. Charles R. Crane, of Chicago (once nominated by Mr. Taft as Minister to China, but recalled), had contributed $70,000 each to the campaign treasuries of Senator La Follette and Woodrow Wilson when they were candidates for the Presidential nomination. Mr. Crane says that the amounts were $20,000 each. Mr. Crane is treasurer of the Democratic National Committee. Senator Dixon says that Frederic C. Penfield, of Philadelphia, gave $46,000 to the Wilson fund, but Mr. Penfield swears that the amount was actually $1,000.

The Campaign Governor Wilson was given a hearty reception at Lincoln, Neb., by Mr. Bryan's neighbors. "It was Mr. Bryan who set us free," he said. Mr. Bryan on his part praised the courage, integrity and intelligence of the Governor. The ex-candidate declares that Mr. Roosevelt is losing ground: "The people are getting acquainted with the movement he represents. Voters are beginning to understand what turned the tide in 1896 and 1900."——Before going to Lincoln, Governor Wilson spent thirty hours in Indiana. There was a show of popular approval, tho the State is nominally Republican. Governor Wilson attacked Mr. Roosevelt for having permitted, as President, a growth of monopoly "upon a scale never before dreamed of." The leader who proposes to be the emancipator is, therefore, he said, "a man who has been tried in this very matter and

The meeting of President Taft and Governor Wilson in Boston was an example, a lesson and a credit to both men.

found wanting." In the Steel Corporation town, Gary, before an audience made up of employees of steel works, the nominee denounced the trust's methods and its alleged alliance with Mr. Roosevelt.——At Pueblo, Col., on the 7th, Governor Wilson charged that the Steel Corporation "is behind the third party program in regard to regulation of trusts."—— Mr. Roosevelt has attacked the Democratic nominee for Vice-President, Governor Marshall, of Indiana, as a "representative of the Taggart machine," and compared the latter with Tammany. Governor Marshall pointed, in reply, to his defeat of Taggart in the Senatorial contest two years ago. Later he attacked the Roosevelt platform as stand-pat Republicanism at one end and Socialism at the other, "and the only good things in it are Socialistic."—— Senator La Follette, in his magazine, complains that he was used as a stalking-horse by Mr. Roosevelt—for the purpose of testing Mr. Taft's popularity—and then pushed aside. He charges that Mr. Roosevelt "smeared the issue" and "caught the imagination of the younger men by his dash and mock heroics." "Taft co-operated with Cannon and Aldrich on legislation; Roosevelt co-operated with Cannon and Aldrich." He points to Mr. Roosevelt's "long silence" as President on progressive issues "at a time when his support would have been a tremendous gain." Senator La Follette praises Governor Wilson's recent course in fighting and defeating Smith for the New Jersey Senatorship. Wilson's course and pronouncement ring true, according to the Wisconsin man. ——Prof. A. B. Hart, of Harvard University, has published a long reply to Dr. Eliot's letter in favor of Wilson, summarized last week. Professor Hart favors Mr. Roosevelt, as does Thomas A. Edison. Dr. Wiley explained last week why he supports the Democrat. He denounces the Roosevelt and Taft attitude toward the food and drugs act of 1906.

Oil Trust Letters

Documents published by Mr. Hearst in one of his magazines and alleged to have been reproduced from letters exchanged by John D. Archbold, president of the Standard Oil Company, and various politicians, are branded forgeries by a contributor to *Collier's*. A statement by the head of the firm which manufactured the typewriter upon which the letters to Senators Hanna, Quay and Penrose and General Grosvenor were written, declares that the machine in question was not yet upon the market at the dates given in the alleged letters. A member of Mr. Hearst's editorial office now explains that the letters were reproduced, not from the originals, but from copies. This was done because the originals were somewhat dim, he adds. The *Collier's* article demonstrates that the signatures and official headings were cut out and pasted on new sheets of paper and that all Mr. Archbold's alleged signatures are reproduced or traced from the same signature. Mr. Hearst is now in London. Mr. Brisbane, editor of his *New York Evening Journal*, says he knows nothing of the matter "and does not wish to know anything."

Various Items

The Democratic nominee for Governor of New York, William Sulzer, Congressional representative of an East Side district in New York City, is endorsed by Governor Wilson as honest and independent, and will not be opposed by the Empire State Democracy, the anti-Tammany Democratic organization. The Independence League will support Oscar Straus, the Progressive party nominee. ——The executive committee of the Democratic party in South Carolina finds the evidences of fraud in the primary election of August 7 insufficient to vitiate the choice of Governor C. L. Blease as a candidate for renomination.——Lieutenant D. P. Morrison was killed and eight men injured by an explosion aboard the torpedo boat destroyer "Walke," at Newport, on October 1.——On October 3 a New York, New Haven and Hartford Railroad express was derailed near Westport, Conn. Nine lives were lost and many persons received minor injuries or shock. The accident is not unlike that which occurred to the Federal express on the Fairfield viaduct, east of Westport, on July 11, 1911, when fourteen lives were lost. It is said that the engineer, who had served the line

twenty-seven years, ignored signals and was responsible for the accident, which cost his own life. The Interstate Commerce Commission will investigate. After the derailment, the wooden cars still used by this railway company took fire and burned.

Labor

Striking trainmen of the Georgia Railroad have agreed, with the officials of the line, to submit their case to mediation under the Erdman act. Traffic has been resumed, but rioting has not altogether ceased.——The 35,000 employees of the Nevada Consolidated [Copper] Mining Company, of Ely, Nev., struck on the 3d, demanding an increase of wages and other concessions.——Fear of organized labor is apparently the explanation of the reluctance of talesmen to sit on the jury which will try the ironworkers accused of dynamiting, on trial at Indianapolis. Almost as great difficulty has been experienced in getting a jury as in the case of the International Workers accused of murder at Lawrence, Mass. Three of the fifty-four defendants were summarily discharged on October 1. This was for lack of evidence. Ortie E. McManigal, the informer, has pleaded guilty. The prosecution aimed at establishing the guilt of those who conspired with the McNamaras in the series of nitroglycerine explosions of which the Los Angeles *Times* building wrecking was one. The United States district attorney charges that, five days after the newspaper plant was blown up in October, 1910, a plot was considered by the McNamaras to cause a like explosion in an Eastern city —"to make 'em sit up."

Mexico and Nicaragua

On September 30 the United States consented to the shipping of a force of Mexican troops from Eagle Pass, Tex., to Del Rio and Marathon in the same State—about 90 miles. The Mexicans were engaged in the pursuit of rebels. Objections were made, however, by Governor Colquitt, of

JOSEPH J. ETTOR AND ARTURO GIOVANNITTI

An examination of a venire of 350 talesmen has yielded only four jurors for the trial of Ettor and Giovannitti at Salem, Mass. Fear of the friends of the defendants has led many of the talesmen to declare themselves biased, or opposed to the death penalty. A new panel will be sifted on the 14th. The two organizers for the Industrial Workers of the World are charged with complicity with the murder of a woman last January in strike riots at Lawrence, Mass. A third defendant is Josef Caruso. Demonstrations in favor of the prisoners were made last week in four cities in New England, and were attended by violence. One of the agitators at Lawrence prophesied that the Industrial Workers would march to Salem, storm the jail and try to rescue the prisoners, if found guilty. Demonstrations in favor of them have occurred at Florence, Ferrara, Asoli, Picerno and other Italian cities.

Texas. The soldiers, who detrained at Marathon, would have marched 70 miles across Texas before reaching the border. It was proposed by the United States that Mexico should therefore send the whole force to Del Rio. On the 3d a fight between Mexican Federals under General Blanco and some 200 rebel raiders occurred on the ranch near Badicora, in Chihuahua, belonging to W. R. Hearst. Twenty-six were killed. The rebels in Southern Mexico are using dynamite freely, it is said, and interrupting communication.——United States marines commanded by Col. Joseph H. Pendleton dealt a heavy blow to the Nicaraguan followers of the rebel Zeledon on the 4th, near Massaya. The rebel leader was killed, with over 100 of his men; 200 rebels were wounded. Four Americans were killed and seven wounded. Other clashes have occurred at Barranca and Chichigalpa; several Americans were wounded and some sixty or seventy rebels killed. The insurgents last stronghold, the town of Leon, has fallen.

The Islands Seven hundred and fifty United States marines have been despatched to Santo Domingo, where revolutionists recently seized the custom houses on the Haytian frontier. The collection of customs revenue is supervised and controlled by representatives of our Government. Apparently the revolution has been promoted by a junta in New York, and in the interest of General Horatio Vasquez, formerly a member of the Cabinet of President Caceres, who was assassinated a few months ago. After the death of Caceres, Vasquez sought the Presidency. When Euladio Victoria was elected, he left the country.——The Cuban Government's financial condition leaves much to be desired. More than $12,000,000 is due to contractors for public work. The Secretary of the Treasury, Señor Quiros, says, however, that the bills will be duly paid. The Speyer loan of $16,500,000 has been spent, but the sewage plant and paving of Havana, for which the loan was authorized, are far from completed. The Government faces a grave crisis, and this just as a Presidential election draws near.——The trial of Enrique Maza, who assaulted Hugh S. Gibson, United States chargé d'affaires, in Havana, will soon take place. The prosecutor asks that Maza be punished by imprisonment for four years. On September 19 Mr. Gibson was ordered transferred to the legation at Brussels. He will not leave Havana before November 1. From Washington it is reported that the transfer is "a distinct promotion."——It is expected that Secretary Fisher, having conducted an investigation in Honolulu, will recommend that the Hawaiian organic act be so amended that it will permit the appointment of a Governor from the States. At a recent hearing he asked several prominent men whether a candidate otherwise qualified, but not affiliated with the sugar or other powerful interests, could be found in the islands, and the answers were in the negative. The inquiry relates in part to charges against Governor Frear.——In the last fiscal year, the foreign trade of the Philippines made a new high record. Exports were $50,219,836, and imports $54,549,980, each of these sums being about twice as large as the best record made before American occupation, while the total exceeds that of 1911 by 25 per cent. The leading exports were copra, $16,514,749; hemp, $16,283,310; sugar, $10,400,000; tobacco, $4,595,000.

South America Projects for the sanitary improvement of Guayaquil are under consideration in Ecuador's Congress. The newspapers urge the Government to reject proposals made by Americans, saying that acceptance of them would endanger the nation's integrity. Preparations were made for a mass meeting in Guayaquil, to protest against the acceptance of American bids, but the meeting was not held, owing to the interference of the police. The Government suffers in public estimation because of a prevailing impression that it regards the American bids with favor.——On the 25th the retiring President of Peru, Señor Leguia, was mobbed, and greeted with shouts: "You should be going to jail, not home!" He is succeeded as President by Guillermo Billinghurst.——Peru's Congress has approved a resolution protesting against the attitude of the United States concerning the offenses in the Putumayo rubber district. The resolution also calls

for an investigation and for punishment of the guilty. A Peruvian residing in Barbados has been indicted there for murder committed in Putumayo. Peru's Senate has voted for an internal loan of $50,000,000, to be used for the national defense.——Brazil's Government has given to a German syndicate a contract for the construction of the Santa Catarina railroad, 600 miles long, with harbor and land concessions. Uruguay's Government is negotiating with the Farquahar British syndicate for a new railroad that will reduce the time of passage from Montevideo to Rio Janeiro by thirty-six hours.——Peace has been restored in Para by an agreement of the factions, and the Brazilian Government has withdrawn the Federal troops.——Tariff reciprocity with this country is suggested by bills, introduced in Argentina's Congress, which the Government will support if concessions are made at Washington. The bills provide for a reduction of the duties on American machinery, petroleum and other products.

The Trouble in the Balkans

Turkey is threatened by a combined attack from the four surrounding kingdoms. Bulgaria, Servia, Montenegro and Greece have mobilized their troops and Turkey is taking the same action. In all five of these countries the war spirit has reached a high pitch, and the European Powers plan to intervene in order to prevent an outbreak. The Powers disapprove of the warlike spirit of the four kingdoms, the scope of whose agreement is not known to the public, but it is understood that they will press for radical reforms in Macedonia; nothing less than local self-government for each of the Macedonian provinces (vilayets), under a foreign Christian governor appointed by the Powers. This demand is based upon Article XXIV of the Treaty of Berlin, to which the Balkan States owe their existence. This Article stipulates that the Sublime Porte shall carry out in Crete the reforms promised after the Cretan insurrection of 1866-68, and then adds:

"Similar laws adapted to local requirement, except as regards the exemptions from taxation granted to Crete, shall also be introduced into the other parts of Turkey in Europe for which no special organization has been provided by the present treaty.

"The Sublime Porte shall depute special commissions, in which the native element shall be largely represented, to settle the details of the new laws in each province. The schemes of organization resulting from these labors shall be submitted for examination to the Sublime Porte, which, before promulgating the acts for putting them into force, shall consult the European commission instituted for Eastern Rumelia."

This clause, like many others of the Berlin Treaty, has proved a dead letter. Crete, under the control of the Powers, has become virtually independent, altho still prevented from accomplishing its ardent desire for annexation to Greece. But no attempt has been made by the Powers to exercise a similar authority over Macedonia, altho from time to time, when evidences of tyranny and discontent became too rank, pressure has been brought upon the Ottoman Government to introduce administrative reforms, but these have done little to ameliorate the lot of the opprest and turbulent inhabitants. Much was hoped a few years ago from the reorganization of the Macedonian gendarmerie under an Italian officer, but this was not successful, and the Young Turks, for all their good resolutions, do not seem to have materially improved upon the administration of Abdul Hamid. During the last few weeks the Powers have had under consideration the plans proposed by Count Bechtold, Austrian Minister of Foreign Affairs, for the "decentralization" of government in the Christian provinces of Turkey. The Balkan States, however, are manifestly determined not to wait for the slow operations of diplomacy and have resorted to what in labor circles is euphemistically alluded to as "direct action." Now realizing the necessity of prompt and forcible interference, France has called upon the Powers to unite in holding the Balkan states in check, upon the assurance of enforcing upon Turkey an effective policy of Macedonian reform. This action, according to the French plan, is to be carried out either by all the great Powers in concert or by Russia and Austria-Hungary together in the name of the Powers. M. Sazonoff, the Russian Foreign Minister, who has been last week in consultation with King George and Sir Edward Grey at Balmoral, is now in Paris, with President Fallières and M. Poincaré, the French Premier, so presumably the plan represents the policy of the Triple Entente. It has not yet, however, secured the adhesion of all the Powers, Austria, by rumor, being the recalcitrant party. French investments in the Balkan states are estimated at $800,000,000, and the financiers of France as well as of other countries have refused loans for carrying on the war.

The Arming of Four Nations

King Peter convened the Skupshtina, or National Assembly, of Servia at Belgrade on October 5, and in his opening address explained his action in mobilizing the troops in the following words:

"I have applied with friendly counsels to Constantinople regarding the misery which the Christian nationalities, including ours, are suffering in Turkey, and it is to be regretted that all this was of no avail. Instead of the expected reforms we were surprised a few days ago by the mobilization of the Turkish army near our frontiers. To this act, by which our safety was endangered, Servia had only one reply. By my decree our army was put into a mobile state.

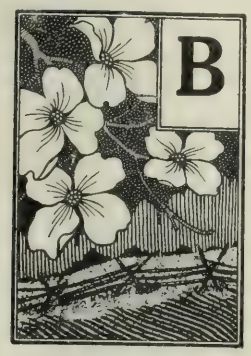
"Our position is clear. Our duty is to undertake measures insuring our safety. It is our duty, in conformity with other Christian Balkan States, to do everything in our power to insure proper conditions for a real and permanent peace in the Balkans."

The first raid into Turkish territory was made by the Bulgarian bandit Sandansky, who in 1902 kidnapped Miss Ellen M. Stone, an American missionary, and held her for a ransom of $65,000 to procure funds for his campaign. At the head of a band of 2,500 Bulgarians he crossed the frontier and burned the Turkish blockhouse at Oschumava and occupied a strategic position above the Struma River.——The reason why Greece should take an active part in the impending struggle is obvious when it is remembered that the great majority of Greeks still live under the Turkish flag. The twelve islands of the Ægean seized by Italy in the present war are clamoring to be annexed to Greece instead of being returned to Turkey upon the conclusion

of peace. The Cretans have armed themselves for the purpose of joining the Greeks—tho of course the Powers in control of that island will prevent their taking an active part in the conflict. Still, the Greeks smart under the sting of defeat by the Turks in 1897, when they attempted to conquer Macedonia and instead were obliged to submit to the loss of a part of Thessaly. The order for mobilization has called to the colors Greeks from all parts of the world. In the United States there are 350,000 Greeks, of whom some 75,000 are subject to military duty. The number of Greeks responding to the first call to arms was so great that transportation could not be provided for them at New York. The "Macedonia," of the National Steam Navigation Company, and the "Martha Washington," of the Austro-American Line, last week carried back from New York 1,500 Greeks, many of them volunteers, for, coming from the Ottoman Empire, they were not liable to conscription. Four torpedo boats being constructed at Liverpool for the Argentine Government have been bought for Greece and will come to Philadelphia to take on board ammunition from the Bethlehem Steel Works.——The Turkish mobilization has brought out 250,000 men under arms. The headquarters of the eastern army is at Constantinople, where it can be used against the Bulgarians, and the headquarters of the western army is at Janina, facing the Greek frontier. The people of Constantinople are wild for war. Crowds of men, women and children fill the streets, shouting and singing and listening to impassioned speeches. Mohommedans from all parts are flocking to the standard of the Caliph. The Young Turks and their political opponents are equally ardent in their support of the Government in this crisis.——The British Mediterranean fleet has been ordered to the Levant, the cruiser "Weymouth" being stationed at Suda Bay on the north shore of Crete.

Foreign Notes

The British Government shows no signs of weakening in its Home Rule bill policy on account of the Ulster demonstrations promoted by Sir Edward Carson. Parliament opened on Monday, the 7th, and the Home Rule bill is scheduled to be passed on December 20. At least thirty-five of the forty-nine full working days will be given to the discussion of the bill. Other measures taken up in this session will be Welsh disestablishment, franchise reform and trades union bills. Premier Asquith, in a speech at Ladybank, Scotland, said that "the Opposition demonstrations in the North of Ireland have revealed nothing that was not perfectly well known before." He said they had raised a spirit of lawlessness, but that they must not imagine that they could confine their doctrine to a case which happens to be politically convenient at the moment.



"If what four-fifths of the Irish people demand is not granted, and if Irishmen see their long-cherished aspirations frustrated, they may turn and say, 'We will take the law into our own hands.' No body of responsible politicians has ever struck a more deadly blow at the foundations of democratic government."

——The hunger strike of the suffragets has again proved successful. Miss Gladys Evans, who was sentenced on August 7 for setting fire to the Theater Royal, Dublin, has been released on license because of the condition of her health resulting from voluntary starvation and forcible feeding.——The Spanish Government has put an end to the strike of the railroad men by the same method employed in France, that is, the mobilization of the reserves. Sixty thousand men, including all the reservists who have left active service within the past six years, were called to the colors, and the strikers, who were largely included in this draft, were obliged to come to terms. The companies have promised to meet the demands of the men. Premier Canalejas holds that the general strike is a social war and authorizes the strongest measures on the part of the Government. ——The trial of the Korean conspirators on the charge of plotting to assassinate Count Terauchi, Governor-General of Korea, resulted in the acquittal of seventeen and the conviction of 109 of the prisoners. Baron Yun Chi Ho and five other leaders were sentenced to ten years each; eighteen were sentenced to seven years each, forty to six years, and forty-two to five years' imprisonment. Many of those convicted of conspiracy are Christian converts.

The Lynching of Robert Johnson

BY JAMES OPPENHEIM.

[Out of a hundred lynchings this one is told by an experienced writer who was commissioned to investigate a lynching which was notable for the fact that, since he was taken from the officers of law and murdered, the victim's guilt has become a matter of very serious doubt.—EDITOR.]

BLUEFIELD, W. Va., is a railroad yard with houses all around it. Its main street looks down on coal cars and switch engines and looks up at splendid cliffs opposite, on the top of which are immense bill-boards advertising talcum powder and the Appalachian Power Company. The latter sign, illuminated and in motion, dominates the twinkling valley by night. Seventeen hundred people dwell there in an atmosphere of soot, among the white vapors, the trundling of wheels, the alarm of bells and the incessant sound of steam escaping.

The little valley is distributing center for the adjacent coal region; and necessarily Bluefield is a town of workers; a town of railroad and coal men with the shops, hotels, jails, churches and saloons that depend upon them. Life dies there with sundown for those inhabitants who are not drawn to the bars, the prayer meetings and the moving pictures.

The town has a fascinating human mixture, reminiscent of border days; there are the natives, the lanky lovable Virginians; there are Yankees and Westerners; a few Slavs and Germans and Italians; a nondescript shifting populations of rough laborers; and an immense number of negroes. In fact there are so many negroes that the county is divided in its government; the judge, for instance, being a Republican, the prosecuting attorney a Democrat. And one is reminded further of border days by the tales of the feuds, and the swift pulling of guns and the assassination of citizens.

It is undoubtedly the presence of the negroes that gives the town its dominant characteristics. There is a sharp social cleavage, a sharp industrial cleavage, as well as political division. The white railroad workers object to doing teamwork with negro firemen; and socially the negro is shut into his own part of town.

As one of the members of the local government put it to me:

"We lost a great war, and saw our ignorant nigger slaves put in power over us and our women insulted. Every spot in the South has its woman or two branded for life. And the worst riff-raff of the North came down to lord it over us. What could we do? Our only way to win back power was thru our Ku Klux Klans—thru lynch law. There was no other law to help us. And now the niggers must be kept down. I'm a humanitarian all right, but the nigger must know his place."

And as one of the ministers told me:

'There's no trouble so long as they know their place. I've preached in their churches for them; and I'm friendly as any one to them. You know we have a colored institute down here where they're giving the niggers normal training. That bunch is all right. You can phone over there and a fellow will drop his book of Latin or algebra and come over and scrub the floors for you. That's the proper spirit."

In short, the whites are in a state of expectancy that sometimes borders on hysteria. And recently in Princeton, a town ten miles away, the rumor went forth that a negro had insulted a white woman. He escaped unpunished—there was no evidence against him—and so especially in Princeton, recently, expectation ran high.

Such is a sketchy outline of conditions preceding the morning of September 4th last.

Now Gordon White is a construction foreman in the railroad yards, a stocky back-bent mountaineer, quiet and passionate, very pleasant with his neighbors, very hard on the negroes. He believed "in drivin' the niggers with a whip, and sweatin' the work out of them, for

they're a good-for-nothing lazy lot." He has a neat house on Caroline avenue, and here, recently, he lived alone with his daughter Neta. His wife was away on a visit to his other children in Virginia: Neta is sixteen; an attractive blossoming girl, with the hardy mountaineer freshness and vitality, and, as one of the policemen put it, "with more than the run of nerve." She worked alone in the house while her father was in the yards.

He left her, as usual, at seven on the morning of September 4th. At a quarter to nine Neta flung open one of the sitting room windows and screamed for help. Neighbors rushed in, and found her lying on the floor in a distraught condition. This was the story which she told:

At about seven-thirty there was a knock at the front door. She opened it and a negro stepped in. She thought she had seen this negro before; that he had called several weeks previously to get a coat for her father. This time he said that her father had sent him for the tape-line. Neta turned to the staircase; whereupon the negro seized her and attempted to stifle her cries by forcing a large bandanna handkerchief into her mouth. At the same time he dragged her into the sitting room. She screamed, however, and was answered by the loud barking of the dog in the basement. She lost consciousness then, and when she awoke, crawled desperately to the window, raised it, and called for help.

In spite of the speed and excitement of the occurrence she gave a most vivid description of her assailant. He was quite black, about five and a half feet tall, medium slender, heavy moustache, looked as if he had a week's growth of beard, dressed in overall jacket, light hat, blue overalls with bib coming over breast, wore watch chain across breast to pocket in overalls, dark or dirty shirt, had red bandanna handkerchief, and low cut shoes.

A doctor was called and found that beyond the shock no harm whatever was done to the girl, the assailant probably fleeing when the dog began to bark. And seeing her two weeks later there was hardly evidence of shock even; she seemed sparklingly alert and animated; tho there were times, the doctor said, when she was seized with nervous chills and the mention of the word "nigger" sometimes brought these on.

At nine o'clock, then, the alarm was given, and soon citizens and officers, afoot, on horseback and in automobiles were making a search of the vicinity. Two men were arrested, Walter Jackson and Robert Johnson. Suspicion immediately attached to the latter. Altho he did not tally with the description—he wore black trousers, a fresh shirt, and a small growth on his upper lip in place of a moustache, and he was a large, heavy fellow—yet, so I was seriously informed, he spoke between his teeth and showed great sullenness, refusing at first to answer questions. As several assured me, "he had a guilty look about him," and as one discerning citizen put it:

"Now he mightn't a done the crime; but there's no doubt in my mind that that nigger did do *somethin'*."

Questioned by the local magistrate, however, he said he had come to Bluefield that morning from Graham, a village three miles distant; that as his underwear and shirt were in a soiled condition, he stopped at a store and bought a new set; and that he had then gone to a cornfield not far from the White house and there changed his clothes. He had previously been working at Jaeger, and had come over to Graham in boxcars.

Johnson willingly took officers to the cornfield and the old clothing was found.

Then he and Jackson were taken to the White house in an automobile. The father was now at home, in a frenzied condition, but not so far gone but what he could precede the suspects to his daughter's room and assure her, before witnesses:

"Neither of them niggers ever worked for me. They ain't got the right man."

The negroes were brought in, and Neta failed to identify either. She thought, after further questioning, that possibly Johnson reminded her of the assailant, but the assailant had been dressed differently. Whereupon the two men were taken back to jail, and the search continued.

Opinions vary in regard to Johnson's condition during the day. I was told by some that he spent the time crying and

moaning, and asking, "Why is everybody lookin' at me this mornin' as if I done somethin'?" Others, however, say that he showed great courage, and was cool and determined, repeating over and over again that he was innocent and not stumbling in his story.

In the meantime the news had spread thru the town, and the pent-up expectancy was released. The excitement grew and something had to be done.

Doubtless the police felt this, for what they next proceeded to do was quite amazing. They made Johnson get into his dirty clothes and then took from another negro overalls with a watch chain across the breast and these, too, were put on Johnson. In other words, *they dressed him to fit the description.* According to one witness, Johnson then cried out:

"I'm ruined—now I'm ruined."

It was late in the day now and the streets were filled with excited crowds. The officers took Johnson in the automobile thru the main thorofare. By this time Neta was in a bad nervous condition, a condition bordering on hysteria. And when Johnson was brought into her bedroom she threw up her hands and shrieked:

"That's the man! that's the man!"

At once the officers put Johnson in the automobile again, and breaking the speed limit, shot through the town, and away to the town of Princeton, ten miles off. This was a bald advertisement to all of Bluefield that the rapist had been caught. A great crowd set off at once to lynch the prisoner.

Princeton, too, was ripe for excitement. The negro who was supposed to have insulted a white woman was remembered. A great crowd surrounded the jail; the sheriff was disarmed; a search was made inside, but Johnson had been "spirited" away to some other hiding point, presumably to Berkeley. After waiting nearly all night the crowd dispersed, and Princeton quieted down.

However, the feeling of the people may be judged by the headlines that appeared in the *Bluefield Daily Telegraph* the next morning:

"Negro Fiend Attacks Bluefield Girl and Entire City is Stirred as Never Before.—Prompt Action by Officers and Citizens Results in Capture of Man Believed to be Guilty One. . . . Enraged Citizens Gather to Wreak Vengeance on Negro Accused of the Crime."

However, the *Daily Telegraph* pointed out in its news column that there was some doubt that the right man had been caught and counseled further search.

But evidently few of the Princetonians had any doubts; for, learning that morning that Johnson was in the town of Rock with two police officers, a crowd of railroad men asked the railroad officials for the loan of a special train to give chase. The loan was refused them, whereupon the men took a road engine and two coal cars and sprinted for Rock. They were a bit late, however, so they side-tracked the stolen train and went on afoot, and with good results. Johnson was overtaken, the officers intimidated, and the prisoner brought back to Princeton on a freight train.

The train reached Princeton at 7.30 P. M. But the news had preceded its arrival and an enormous crowd swayed around the depot. This crowd followed the railroad men and Johnson to the court house. They were met here by Judge Maynard, Assistant Prosecuting Attorney Ross and the Rev. Dr. Hamilton, Neta White's pastor.

Judge Maynard blocked the doorway and made himself heard. He said that there was considerable doubt about the identity of the negro and pledged a speedy trial if necessary. He would convene court the next morning, he said. He pleaded with them, doubtless with much sincerity, and finally introduced Dr. Hamilton.

Possibly it is worth while quoting part of what Dr. Hamilton said:

"I am not here to save this negro. This young woman who was attacked is a member of my Sunday school. A few months ago I stood at the altar and received her into my church. She is a bright, sweet girl and is as close to me almost as one of my own family. If this prisoner did what he is charged with he ought to die, and I care not how soon. I am not here to save the negro, but to save this sweet young girl from a serious responsibility. She must say the word that will mean life or death for him. If it should turn out that she is mistaken it would be a terrible memory for her to bear thru life. I am not trying to save this negro, but to save you men from a terrible mistake, if it be a mistake, and to save you from a crime, for it is a crime to take the law in your own hands."

In short, it must be said that the officials of the county and the girl's pastor met the issue courageously and squarely. And their words had such effect, that the judge was able to swear in members of the mob as deputies to protect Johnson in the jail. The prisoner was then placed in a cell and the crowd began to disperse.

At this point Neta White's father arrived in an automobile from Bluefield for the purpose of "identifying the man" —this, after his positive statement the day before that no such man had ever worked for him. According to White, himself:

"I was took into the jail, and there was niggers in different cells. I seen Johnson in one of them, and the minute I set eyes upon him I knew he was guilty. I knew it. I just knew it. I could tell by the way he looked. And when he seed me looking at him, he says, 'Boss, I never worked for you, did I, now?' But I give him a look, like this, and I passed on around to the other cells. And then I come on back to Johnson and I give him a look again, and I knowed it was he. And so I said it was he and I said I wanted him lynched. Yes, I know he was guilty; I just know he was guilty. Anyway, I done as well as any man could in the circumstances. I blame them. I blame them for taking me over there when I was crazy wild. Of course if I'd a had two days to cool down in! But I hadn't slept a wink the night before. Why did he say, 'I'm ruined,' when they put the other nigger's overalls onto him? I blame them. I done as well as I could. But I know he was guilty. I'm just sure he was guilty. Couldn't look me in the eyes, he couldn't. I seed it the minute I got sight of him."

Well, it was, after all, very simple, very elemental. The burly negro screamed to the officers, begging them to kill him, to shoot him, not to let him fall in the hands of the mob. He knew, he knew only too well what savagery had been released, what relentless livid hate, what base lusts. But many hands dragged him and beat him; and a great howling spread over the street, like so many wild animals roused in the jungle; and there were curses and screams and shrieks, and the eddying and surging and clashing of many bodies, and in the center, gradually working down the electric lit street, the screaming negro. Knives were jabbed into him, fists descended upon him, he was stoned and beaten with clubs. Then a chain was put round his neck and they tried to hang him to a trolley support and failed. Next a man climbed a telephone pole with the chain, the negro was raised up, shots were fired into the body and the crowd paraded round and round, yelling and shooting and mutilating.

Such in brief is the story of the lynching of Robert Johnson. It was not two days before the *Bluefield Daily Telegraph* printed the following headlines: "Not Certain That Mob Victim Was the Guilty Man. County Official Bases Grave Doubts on Train of Circumstances."

The Governor, of course, was aroused and asked for action; the prosecuting attorney and Judge Maynard began work at once; the grand jury was convened, but no indictments were found. As one of the best citizens put it:

"The nigger's dead; we can't bring him to life again. Quiet has been restored. What's the use of making more trouble?"

Another exprest the opinion that no jury in that region would find any man guilty in a lynching affair.

Evidently in the "high-spirited" breasts of these West Virginians but one thing rankles. These are the words an official used:

"The whole thing was wrong and the guilty parties ought to be brought to justice. And I'm going to help to bring them to justice. I can't tell you how badly I feel about it. For why didn't they lynch him in the regular way—between midnight and dawn, with masks, and no fuss about it? But this way it's a disgrace to the town, and it's called us all into notice. Down south of us you never hear tell of a lynching. And why? Just because they've got the sense to follow the old traditions."

He said all this with grave earnestness. What he really believed was that the lynchers had shown bad taste in their methods. They had laid themselves open to arrest because every one knew them!

And yet if Bluefield had a courageous man who wanted to lay bare the truth of the matter, I do not believe it would be hard to find. As the case now stands, there is absolutely no legal evidence that Johnson committed the crime, nor is there even legal evidence that a crime was committed. There is merely the word of a sixteen-year-old girl who could not identify Johnson the first time he was brought before her, and only accused him when he was dressed to fit her description; a girl who said seriously that she lay an hour and a half in a faint; who stated that a bandanna had been stuffed in her mouth, a bandanna not afterward found on the premises.

As for Johnson, legally he had an alibi proved by himself, by the father and daughter. He may in some strange and inexplicable way have been guilty, but what evidence did they have that he was guilty? What they did have all tended to establish his innocence. These questions were not only unanswered, but unasked:

1. Had Johnson ever worked for Gordon White?

2. Why did Neta White allow her assailant in the house if she did not know him? And if she knew him so well that she recalled his coming a couple of weeks previously, why was it so hard for her to identify him a few hours later?

3. If Johnson never worked for Gordon White how could he so soon master the following facts: that Neta was alone at home; that White was in the habit of sending for various articles; that he might send for such a thing as a tapeline?

4. Had Johnson, as he said, been working at Jaeger? (I was told, but this was hearsay, that the Jaeger timebooks prove this. The fact could be easily ascertained.)

5. If Johnson had been guilty would he have so willingly shown his captors where he had discarded his dirty clothes? And is it conceivable that he would have lingered so near the scene of the crime when he made the change of clothes?

6. The merchant who sold Johnson the new underwear and shirt remembers having done so after he opened his store on the morning of the 4th. This was after seven o'clock. How then did Johnson have time to get to the White house by 7.30?

7. Why was White, who had claimed he never had seen Johnson before, taken to identify him?

In short, put in the most favorable light, there may necessarily be doubt as to whether Johnson was guilty or not, but there can be no doubt as to the failure to prove his guilt. And seen in any light at all, what shall we say of the town of Bluefield, W. Va?

I saw the effect of the lynching upon old man White; I saw him two weeks after he had sentenced Robert Johnson to death because "he just seed he was guilty." He sat in a low rocker in the sitting room where the attempt at assault had been made; he was in his stocking feet, his great shock of dark hair stood startlingly up from his wrinkled forehead; and his face had the sort of expression I have seen among the insane on Randall's Island. The eyes were burning bright. And he could not be still a moment. Tho several of us talked across the room, he did not listen to us, but continually broke in, in a harsh, low voice, repeating monotonously:

"I just know he was guilty. Why did he say, 'I'm ruined,' when they put the overalls on him?"

And again:

"I done the right thing and I know it. All the people here know I done the right thing."

And over and over again:

"I blame them. They shouldn't a taken me over that night."

He gave us an exhibition of how he had looked at the negro in the cell at Princeton: the look, certainly, of a maniac. I could imagine a crowd of over a thousand men all with that bestiality in their eyes, all as merciless and maniacal, and I could understand why Robert Johnson screamed to the officers to shoot him down and end his life before he fell into their hands.

Some Celebrated and Historic Trees

BY GEN. JAMES GRANT WILSON

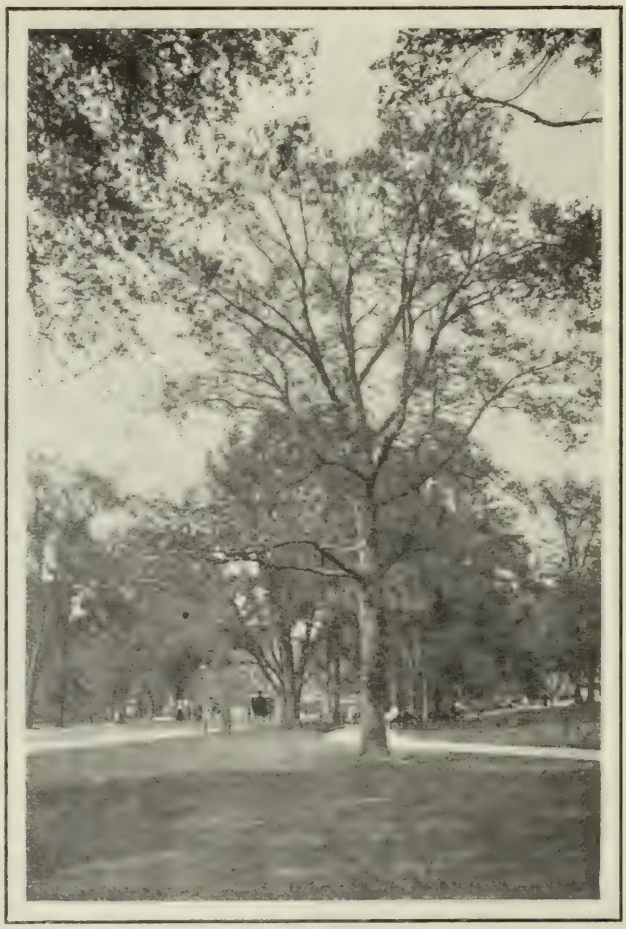
[This is the third article General Wilson, the well known writer and historian, has written for us under the above title. His first article appeared in our issue of August 9, 1906; the second October 20, 1910.—EDITOR.]

DURING his visit to this country in 1860 the Prince of Wales planted on the Mall in Central Park an American elm and an English oak, emblematic of the two powerful nations soon to celebrate the semi-centennial of the signing of the Treaty of Ghent in December, 1814, and a century of peace. The Prince arrived early on the afternoon of Friday, October 12, accompanied by the Duke of Newcastle and other members of his suite, and was received by Samuel M. Blatchford and his four associate park commissioners. Addressing the handsome young English Prince of eighteen, he said:

ENGLISH OAK ON THE MALL, CENTRAL PARK, NEW YORK

Planted April, 1912, in place of an oak planted by Prince of Wales in October, 1860

"The Commissioners of the Central Park, to whom the State of New York has entrusted the construction of this great pleasure ground for the people, have requested me to ask you to do them the favor to plant here two trees—one an English oak, the other an American elm. They trust these trees will long flourish and remain a lasting memorial of your visit to this city and this park."



The elm did flourish, and is not surpassed in beauty of form by any tree of its age and kind in the park, but the oak was not a success, being gnarled and stunted in growth. The latter stood on the west side of the Mall some thirty yards north of the elm and near a fine white oak planted in 1859 by Washington Irving, and now an exceedingly handsome and healthy tree. The Prince always displayed an interest in them, and early in 1883, at Cannes, made inquiries about the two trees of the present writer, as he did seven years later in London. In 1908, after every effort had been made to save the oak, it died and was cut down. Securing from the park commissioner a piece of the tree for the purpose, the writer ordered a dozen paper knives made, sending one to Queen Victoria's eldest son and successor, who exprest pleasure in receiving the little souvenir of his well-remembered visit to our metropolis in 1860. As a memorial of King Edward the Peacemaker, and the friend of this country, a fine young English oak was on April 23, 1912, placed on the same spot where the Prince had planted one fifty-two years earlier. In his address on the occasion the writer said:

"I trust this memorial oak may grow to surpass in age and size the oldest and largest living tree on Manhattan Island. Henry Hudson may have seen the gigantic tulip tree on Inwood Hill as he passed up and down the grandest of rivers which bears his name and will always continue to be his most enduring monument."

The ancient tulip tree, in which Park Commissioner Stover is much interested, has by his order had a large cavity in its huge four-century-old trunk filled with

cement, and the mammoth surrounded with an iron picket fence to prevent any possible injury to Manhattan's oldest and most interesting tree.

When Dean Stanley was in New York he wished to see the elm and oak planted by the Prince, also the group of thirteen trees planted by Alexander Hamilton. In Boston the Dean exprest a desire to gaze upon the grave of the dear Indian apostle, John Eliot, who graduated at English Cambridge in 1623, and to see the Eliot oak at South Natick. He was interested in a tree story related to him by Whittier. In the early days of the Civil War a country Quaker called on the poet. The disciple of George Fox was the owner of a small forest of sturdy oaks which the Government wished to purchase for the construction of warships. He was of course aware that a sale for such a purpose was inconsistent with the gospel of peace. Whittier, believing that he had decided to sell, or else considering that there was such a thing as forcing a creed too far, replied: "Well, friend, if thee dost sell timber to the United

WASHINGTON IRVING WHITE OAK
(Planted 1857) In the background is the King Edward oak

States, be sure that it is all sound." The Quaker's farm supplied the oak that was in the "Kearsarge" when she sank the "Alabama," and the writer possesses a paper knife made from her well-seasoned timber. A duplicate was sent to the Dean of Westminster. Eliot's oak is the subject of one of Longfellow's finest sonnets praised by Stanley.

THE SMALL TREE IN THE FOREGROUND IS AN ENGLISH OAK PLANTED IN HONOR OF KING EDWARD

In the Oregon Sierra is a forest of giant pine that covers four thousand square miles. These noble trees tower two and three hundred feet high, and are excelled in size only by the enormous redwoods of California. Tho the sugar pine—so called because its sap is sweet—predominates, the forest also contains oaks, spruces, cedars, firs, laurels and huge hemlocks, the latter growing on elevations of seven thousand feet above sea level. This vast forest empire is the possession of the National Government, and is as large as the entire State of Connecticut. Its magnificent trees are protected and preserved for future generations. In North America there is nothing comparable to this

HUMBOLDT'S GIANT TREE—THE ZAMANG DE GUERRO OF ARAGUA, VENEZUELA

primeval park, thru whose trackless depths the black and cinnamon bear, the cougar and panther, the lynx and wolf, the elk and deer, roam undisturbed, for a large force of vigilant rangers patrol every portion of the enormous reservation during the summer season. Indeed, it may be doubted if anywhere in the wide world there exists an equally vast forest containing so many millions of magnificent and gigantic trees as may be seen in the evergreen garden of Uncle Sam in the Oregon Sierra, and fit, to quote a line from John Milton:

"to be the mast of some great ammiral."

It is also now believed that the Oregon junipers and not the California redwoods are the oldest living things upon earth, it being asserted that, while the sequoia may attain to an age of three or four thousand years, the junipers live in many instances to more than double that period. For a particular tree of this species in the John Day Valley an age has recently been claimed of not less than ten thousand years!

Baron Humboldt's Giant Tree, or the Zamang de Guerro of the Valley of Aragua, Venezuela, is believed to be the largest tree and among the oldest in the world. When discovered by Christopher Guerro early in the sixteenth century, it was the same size that it is today. Humboldt saw and described the giant a century ago. Its beauty is hightened by orchids and other parasitic plants, whose blossoms adorn its enormous green masses of verdure. Just before his death an American traveler showed him a photograph of the Zamang, as it is called by the natives, and he was greatly affected, saying: "Ah! see what I am now, and this noble tree is just what it was when I beheld it sixty years ago. Not a branch has drooped. It stands precisely as it did when Bonpland and I gazed at it in wonder, both young, vigorous and full of life, our serious studies enlivened by youthful enthusiasm." It is the largest of its species known. Its branches are 561 feet in circumference, and beneath its shade flocks and herds find shelter from the oppressive midday sun.

Another equally famous tree, supposed to be three thousand years old, was the gigantic Dragon Tree (*Dracœna draco*) of Orotava, an object of veneration among the Gouanches of Teneriffe. Its circumference when it fell, in 1871, was forty-six feet. It was at Orotava that Humboldt is said to have exclaimed, "I have found the Garden of Eden!" He also exprest the opinion that the view overlooking the lovely rose-filled Valley of Oro-

tava on the western coast of the Island of Teneriffe was the most beautiful prospect in all the wide world, but a visitor in 1911 to the summit of Corcovado Mountain at Rio de Janeiro, Brazil, believes that glorious view surpasses it both in beauty and in grandeur. An anonymous author writes recently of Orotava, where the ancients placed the garden of the Hesperides, or assigned it as the ultimate limit of heroic striving to come face to face with the things of the gods. The poet concludes:

"Lost to the world the golden-fruited trees,
Age upon age the world has sought for these—
Man's heart restores him the Hesperides."

In the Economic House in the Royal Gardens at Kew, London, there is a branch of the celebrated dragon tree, carried there when the giant was destroyed by a hurricane forty-one years ago. The branch was removed from the fallen monarch of the forest and carried to Kew, where it still thrives, and is an object of interest to many American visitors.

In Spain may still be seen the ancient oak of Guernica, a most venerable natural monument. Ferdinand and Isabella in 1476, many years before they first saw Columbus, repaired to this celebrated tree, under which the King and Queen made oath to the Biscayans to truly maintain their *fueros* (privileges). Wordsworth in 1810 made the historic oak the subject of one of his many noble sonnets. What other interest belongs to the famous giant in the minds of the people of Biscay will appear in the English poet's lines:

"Oak of Guernica! Tree of holier power
Than that which in Dodona did enshrine
(So faith too fondly deemed), voice divine,
Heard from the depths of its aerial bower—
How canst thou flourish at this blighting hour?
What hope, what joy, can sunshine bring to thee,
Or the soft breezes from the Atlantic's sea,
The dews of morn, or April's tender shower?
Stroke merciful and welcome that would be
Which should extend thy branches on the ground,
If never more within their shady round
Those lofty-minded Lawgivers shall meet,
Peasant and lord, in their appointed seat,
Guardians of Biscay's ancient liberty."

In Greece may be seen an olive tree under the branches of which it is believed Plato conversed with Socrates about the soul, and St. Paul rested under its shade when on his way to Athens to announce the word of God to the Epicureans and Stoics. This wonderful tree, which has flourished for more than two thousand years, still bears abundant fruit. Another remarkable tree, represented as among the largest in the world, is to be seen at Mascali, near the foot of Mount Etna. It is called "The Chestnut Tree of a Hundred Horses." Its name originated from the report that Queen Jane of Aragon, with a party of her principal nobility, took refuge from a violent storm under its broad branches.

Cos, the celebrated island of the Sporades, that gave birth to Hippocrates, greatest of physicians, and Apelles, the greatest of the painters of Greece, contains in the center of its public square a magnificent plane tree, famous thruout the civilized world. Its far-reaching branches cover the whole square. Left to themselves they would break of their own weight, had not the inhabitants supported them on marble columns. The people devote to this monarch of trees a kind of worship, not less sincere nor less profound than they pay to the surrounding edifices, the last witness of their former greatness and grandeur.

On the island of Ceylon is a sacred tree enshrined in the hearts of four hundred millions of Orientals The Bo-tree was planted in 228 B. C., and is therefore now two thousand two hundred years old, and has during all those centuries been dropping its consecrated leaves into the hands of pious pilgrims. They are carried away only when they fall, for they are deemed too sacred to be touched with a knife. Sir Emerson Tennant gives reasons for believing the historic tree is really of this wonderful age. He says:

"Estimates of the age of other old trees in the world are matters of conjecture, which, however ingenious, must be purely inferential. Whereas the age of this Bo-tree is matter of record; its conservancy has been an object of solicitude to successive dynasties, and the story of its vicissitudes has been preserved in a series of continued chronicles among the most authentic handed down to mankind. To it kings have even dedicated their dominions, in testimony of belief that it is a branch of the identical fig-tree under which Buddha reclined at Urumelya when he underwent his apotheosis. Its green old age would seem almost to verify the prophecy given when it was planted —that it would flourish and be green forever."

A colossal yew tree that stands in one of the courts of the feudal Castle of La

THE DRAGON TREE OF OROTAVA
From an ancient picture published in a New York paper in 1819

Motte-Feuilly, on the borders of the former provinces of Berry and La Marche, is at once a monument of nature and of history, for, after witnessing the Roman legions march past, it was watered by the tears of Charlotte d'Albert, the unfortunate wife of Cæsar Borgia, Duke of Valentenois, and by those of Jeanne of France, divorced from Pius XII, who came hither to mingle her grief with that of her cousin. Another yew whose trunk is of equal circumference, if not of age, whose branches have mostly died, stands at the entrance to Copped Hall, near the battlefield of Barnet, where Bulwer wrote "The Last of the Barons" and other novels, and where Cardinal Manning was born, in the same year as his classmate, Gladstone, President Lincoln and the poet Tennyson. To quote the lines of another English singer:

"What scenes have passed since first this ancient yew
In all the strength of youthful beauty grew!
Here patriot barons might have musing stood
And plann'd the Charter for their country's good."

Another celebrated yew is the one in the beautiful churchyard of Stoke-Pogis, under which the poet Gray composed his matchless "Elegy," and where he is buried; a second in the churchyard of Fortingal, in Perthshire, believed by botanists to be twenty-five centuries old, and another still older standing at Hedsor in Buclas.

The giant ceiba, or silk cotton, near the Government House in Nassau, is among the world's famous trees. The aerial roots have grown into immense buttresses, giving strength to the trunk in its support of the massive branches, which in their proportions rival the trunks of lesser trees. At Santiago, Cuba, is another smaller ceiba near San Juan Hill known as the "Surrender Tree," under which the Spanish troops surrendered to the army of the United States. In Havana is carefully cherished a ceiba tree which is a direct descendant of the original ceiba under which Velasquez, the founder, held the first religious service at the establishment of the town. These forest monarchs are among the most magnificent trees of the American tropics.

The highest hedge in Great Britain, or I believe elsewhere, is to be seen at Lord Lansdowne's Scottish estate of Meikleour in Perthshire. The hedge is of beeches planted closely together in 1745, but in no way connected with the battle of Culloden fought in that year; they are about a hundred feet in hight and the hedge is more than a quarter of a mile in length. When the writer was there a few summers ago the annual operation of prun-

Natural Curiosity at St. Helena.

NAPOLEON GUARDING HIS OWN TOMB.
From drawing made on the spot soon after his death

ing was going on at an expense of several hundred dollars for each season's performance. A special ladder seventy feet high is used for the purpose. In the same county not far distant and some three miles south of Crieff is the ancient Drummond Castle, approached thru grand old avenues of oaks and elms, which are perhaps unsurpassed, if indeed they are equaled, in the United Kingdom. Its gardens are the most famous in Scotland. The present chatelaine of the castle, the Countess of Ancaster, is an American.

The largest oak now standing in England is the Cowthorpe, near Wetherby, which measures seventy-eight feet in circumference. At one time its branches covered more than an acre. The gigantic Parliamentary oak in Clipstone Park, London, is believed to be one thousand five hundred years old.

"Wise with the lore of centuries,
What tales, if there were tongues in trees.
That giant oak could tell!"

The Fairlop Oak of Hainault Forest was one of England's most famous trees. Every year "one Daniel Fay did come to give bacon and beans away" in what must have been almost unlimited quantities. The custom grew popular, and from towns and hamlets near excursions to the oak were made by multitudes. Out of this grew the Bean Feast, which an English friend writes that he frequently attended when a youth. Its name is to be perpetuated by the cricket ground opened by the present King of England on the site of the ancient oak, the circuit of whose branches was more than three hundred feet, also by the planting on the same spot of a scion of the famous tree.

There is a handsome and interesting oak to be seen in Penhurst Park. It was planted to commemorate the birth of Sir Philip Sidney, "whose spirit was too high for the court, and his integrity too stubborn for the Cabinet." Ben Jonson, in describing Penshurst, thus refers to the oak:

"That taller tree, which of a nut was set
At his great birth where all the muses met."

The poet Waller endeavored to impress his love for "Saccharissa" upon the memorial tree:

"Go, boy, and carve this passion on the bark
Of yonder tree, which stands the sacred mark
Of noble Sidney's birth."

THE GEORGE WASHINGTON PALM
More than 200 years old. Belonged to Samuel J. Tilden

Lord Bradford exercises careful guardianship over the Royal Oak at Boscabel, near Donington in Shropshire, and discards as ridiculous the story that it is not the original tree that sheltered Charles II after his defeat by Cromwell in the battle of Worcester. "I have known the tree myself," he writes, "for half a century, and it looks now very much as it did fifty years ago." But whether it is the oak that saved the King or a scion of the celebrated tree, the constellation *Robur Carol,* the Oak of Charles, was named by Halley in 1676 and the memory of the royal tree perpetuated for all time.

An oak of uncommon size and beauty, and Heaven knows what age, is one of the glories of Hawarden Castle and Park, long the home of England's Christian statesman and perhaps her greatest of the nineteenth century. In the opinion of John Ruskin this noble oak is as near the perfection of a tree as can be seen anywhere in Great Britain. Mr. Gladstone entertained the same opinion. At Cannes in the winter of 1883 he alluded to "old Ravenna's immemorial wood" of Italian pines as profoundly impressive, and the oak, commonly called the monarch of the woods, as an emblem of constancy, strength, virtue and long life.

COPPED HALL

The birthplace of Cardinal Manning and for many years the home of Bulwer, with its many noble oaks and elms and the cedar of Lebanon in the front of the house

In one of the latest and largest residences erected on New York's favorite avenue most of the principal apartments are entirely finished in hard woods of different varieties. For use in the dining hall and its furniture the owner purchased two of the largest and finest oaks to be found in Sherwood Forest and sent them across the Atlantic, where they now form a part of his mansion as above mentioned. Beneath the broad branches of these monarchs of the ancient English forest Saxons hunted and roamed before the advent of the Normans. They witnessed the fall of Harold: the campaigns of the Crusaders; the victories of Agincourt and Poictiers; Caxton's introduction of printing; the discovery of the American Continent by "the world-seeking Genoese"; the birth of Shakespeare; the Protestant Reformation; the achievement of American independence; the rise and fall of Napoleon; the Civil War with the emancipation of slavery in the United States and Russia, also the long and prosperous reign of Queen Victoria. They were a thousand years old.

At the Cathedral of Hildesheim, a small city some sixteen miles south of Hanover, in North Germany, sometimes called "the Nuremberg of the North." may be seen the oldest rose tree in the world. It has lived for more than a thousand years! Its existence can be traced back to the time of Charlemagne, and it is mentioned as a curiosity in old chronicles of the ninth century. It twines round the ancient cathedral, and with its myriad and countless blossoms presents in the summer season an entrancing spectacle. The Hildesheimers very naturally are proud of this venerable relic from bygone centuries, and regard its roses as an almost sacred heirloom from their army of ancestors.

In my last interview with Dr. Holmes, who was a lover of trees, he alluded to the leaf from Milton's mulberry which he planted in Christ Church garden when a student at Cambridge. It was sent to the poet by the present writer. In the course of a conversation concerning historic trees he mentioned the fact that Montaigne first informed us how to tell a tree's age by its rings, and made many other interesting remarks, some of which are included in an address Dr. Holmes delivered before the Tree Planters' Asso-

ciation of Cincinnati. He said: "I have written many verses, but the best poems I have produced are the trees I planted on the hillside which overlooked the broad meadows, scalloped and rounded at their edges by loops of the sinuous Housatonic. Nature finds rhymes for them in the recurring measures of the seasons. Winter strips them of their ornaments and gives them, as it were, in prose translation, and summer re-clothes them in all the splendid phrases of their leafy language. What are these maples and beeches and birches but odes and idylls

THE GREAT TULIP TREE AT INWOOD
The oldest, largest and tallest tree on Manhattan Island

and madrigals? What are these pines and firs and spruces but holy hymns, too solemn for the many-hued raiment of their gay deciduous neighbors?"

Can this third article on celebrated trees—many of which the writer has seen—better conclude than with the beautiful lines entitled "A Ballad of Trees and the Master," from the pen of Sidney Lanier, who, alas! died at the age fatal to Burns, Byron and so many other gifted poets? In the opinion of the Autocrat, Lanier was among the most original and sweetest of all our Southern singers:

"Into the woods my Master went,
Clean forspent, forspent.
Into the woods my Master came,
Forspent with love and shame.
But the olives they were not blind to Him,
The little gray leaves were kind to Him,
The thorntree had a mind to Him,
When into the woods He came.

"Out of the woods my Master went,
And he was well-content,
Out of the woods my Master came,
Content with death and shame.
When Death and Shame would woo Him last,
From under the trees they drew Him last:
'Twas on a tree they slew Him—last,
When out of the woods He came."

NEW YORK CITY.

Before the Burial

BY CHARLOTTE LEECH

Now that thy days have saddened to an end,
How did I love thee, O my friend, my friend?

I loved thee as thirst loves the water brooks,
Or as the midnight student loves his books;

Or as the patriot his native soil,
Or poet the rhymed guerdon of his toil.

I loved thee as the cloud the rainbow arc,
Or as the listening morning loves the lark.

Or as the cloistered nun her rosary
I joyed to count thy kindnesses to me.

I loved thy faith when mine was shrouded o'er,
Thy courage when mine ebbed at every pore.

I loved thy footstep coming up the stair
That ever seemed like answer to a prayer.

Thy laughter and thy tears were dear to me—
Now there is neither mirth nor pain with thee.

Where hast thou wandered in a vast amaze,
Since yester-noon, when parted all our ways?

How often I have left thee at the gate—
Nay, but I will once more, the morn—then wait.

For we shall meet again, O friend, my friend,
And love as we have loved, world without end.

BROOKLYN, N. Y.

New York's Janissaries

BY INSIDER

IT is not at all improbable that one of these days we shall have a strike of the New York police force of 10,000 men, and in that case we shall see what we shall see. It ought to be well worth seeing, but—from a distance.

Every policeman is well armed, most of them are athletic and fearless. If their places were filled and they resorted to the usual striker's tactics, life in New York would certainly not be dull; we should probably have to call in United States troops to shoot them down.

In such a case the place would be a criminal's paradise, with all the evil elements on top, and we should know how it felt for decent persons to live in Paris during the Terror.

The strike won't come until some commissioner undertakes to run the department in the interest of the citizens who are paying for it. That isn't Waldo. Waldo, as he has just proclaimed from the witness stand, trusts the police and does as they advise—or tell him. He is surrounded by flatterers who make him think that everything is all right. He accepts the police organizations, the patrolman's, sergeants', lieutenants' and captains' associations, works in with them, submits to their findings. Practically these are trades union bodies; they have no business to exist among public servants. They destroy discipline.

In each police precinct now there is a representative of the patrolman's association, and if the captain gives orders that the patrolmen do not like a committee of his men calls upon him and persuades him to modify the orders. No one has yet successfully bucked these police associations and it is going to be a very hard job to do it. As a matter of fact, New York is in the hands of its Janissaries, and we have reason for thankfulness in that they do not treat us worse. The patrolman's ideal is the trades union ideal—do as little as possible for the wage: "Ca canny!"

The man on post today is better off than ever. He has only eight hours on duty, and he has all sorts of conveniences and aids that his predecessor of twenty-five or thirty years ago knew nothing about In the old days there were no telephones, no patrol boxes, no patrol wagons; prisoners had to be dragged or helped to the station houses. At the best a policeman might borrow the use of a truck or wagon or even wheelbarrow. But most prisoners were brought in "by hand," which was most laborious. Now the policeman has a swift chariot and plenty of help. In case of resistance the reserves get to his assistance in five minutes.

Burglaries, robberies, grand larcenies, forgeries, murders, do not interest the patrolman. They are none of his business. His business is to patrol along a certain post. Patrol for what reason? asks the citizen who pays. Why, patrol for the sake of patroling is the apparent answer of the Janissaries. Many of the present rules of the police department make it appear as if the object of the higher authorities was to keep the police out of bad company. They must not go into saloons or gambling or disorderly houses. If such places exist on their beats they are not supposed to know or report them. Such matters, with the robberies, burglaries, etc., are, theoretically, all attended to by the precinct detectives, of whom there are from three to five—not nearly enough.

The present policy of the department seems to be to conceal crime and to pretend that good order prevails thruout the entire city. If a citizen goes to a station house and asks to be allowed to see the Robberies' Book he won't get it. Ten chances to one he will be told that for all such information he must go to headquarters. But if he does go to headquarters on any such errand he will be given a long post-graduate course in cooling his heels in outer rooms—and he won't see the Robberies' Book of any precinct.

Let this citizen ask for a list of all the burglaries that have taken place in a given precinct during a certain month.

Quite probably the officer appealed to will say that there weren't any burglaries —or that there is no list, no such statistics, or that only headquarters has authority to make such disclosures. The same with murders, suicides, larcenies. Patrolmen and the lower officers are forbidden to give out information, while headquarters gives out what it pleases. The police idea seems to be that the citizens who pay should have nothing to say about police business, and the less they know about it the better.

Violation of excise law never was so flagrant in New York as it is today. There is no pretense of enforcing it. The patrolman feels that he has been told to shut his eyes, so he gives it no attention; saloonkeepers feel that the present administration protects them in violating this law!

Chaos reigns in the department, and has reigned ever since Mayor Gaynor came in. The policemen do not know where they are at. They feel, also, that some of the orders issued have been in the interest of toughs, thugs, hoodlums, gangsters and against themselves. At the beginning of the present administration the police were called down hard for a number of things. For "mugging" unconvicted prisoners, for unnecessary clubbing of citizens, for unnecessary and illegal raids, etc. They were deprived of their night sticks.

Of course the intention was to make the police keep within the law. It was declared at the time that the London "bobby" does not use his club in making an arrest. That is often stated, but it is not true. The London "bobby" treats his prisoner according to his quality. In dealing with hoodlums he certainly does use his club, just as our men did previous to the present regime.

And the results were better. Most of the gangs of today are made up of aliens and sons of aliens. Moral suasion has no effect upon them. When they are troublesome they need a clubbing, and clubbing gets satisfactory and prompt results. The policeman patrolling among them, who must not use his stick, becomes a laughing stock and a butt for their jokes, which are very practical and not always polite.

The men selected for police service should be trustworthy and trusted. They should have a general knowledge of their rights and duties, and the rights and duties of citizens. They should have common sense and a knowledge of the city, they should be athletically capable. Possessing these things, they should be allowed to exercise judgment. Every case is new—different from every other—and needs new treatment. The policeman without judgment has no right on the force. The policeman is the watchman, the representative of the busy citizens, put out to maintain order, prevent or detect crime and arrest criminals. That is the theory on which the police force is based.

We have 10,000 of these men, and they are highly paid, considering everything. After five years' service a patrolman receives $1,400 per annum—more than many skilled tradesmen get (and police work is really unskilled labor). These are all picked men, having passed a physical examination and a civil service examination. The New York police comprise a splendid army, but it is wofully mishandled by the civilians at the top. Since the beginning of the present administration in the Mayor's office there have been three police commissioners, not one of whom has understood policemen or enjoyed their confidence.

After General Bingham we had Mr. Baker, who was an excellent business man with no knowledge of police duties, but enough wisdom to allow police officers whom he found honest to advise him, even though he at times preferred to follow the dictates of his own common sense in preference to the judgments of his advisers. He made a very good commissioner, but lost his position because the Mayor insisted on his doing things that did not agree with his ideas.

Baker was followed by Cropsey, an eminent lawyer, a good counsellor in accident cases, who had had experience with policemen which led him to believe that they were by habit untruthful and willing to be bribed. His administration of the commissionership was—according to police opinion—severe to the point of cruelty. For small offenses he inflicted the heaviest penalties. He carefully scrutinized applicants for appointment to the police force and kept out a large

number of men with bad records who have since been admitted.

Waldo on coming to the Police Commissionership at once tried to make friends with the police. He took into his confidence a number of men whose past records had been discredited by former commissioners. He was willing to take their words and to found his policy on their recommendations. Waldo was popular for the first few months of his administration, for he promised the men fair treatment and he began by abolishing a number of details and filling up the detail places by temporary assignment. But his fixed post idea earned for him the antagonism of the rank and file of the department. Men were planted on corners and had to stand there for four hours. This was found very hard in severe winter weather. One policeman in Brooklyn actually died of exposure while on fixed post duty.

The man on fixed post was not to leave except to answer an emergency call. The intention was that the citizen needing the services of a policeman would know where to look for one. But as a matter of fact that didn't work. A citizen finding a burglar in his house had no time to run to a fixed post to summon a policeman. The burglar would not await his return. The patrolman's association has succeeded in securing a modification of the fixed post rule. The man on such a post now is only on duty for an hour at a time.

The principal police objection to the fixed post idea is that it reduces (in some precincts by half) the number of men for patrol duty. That made more work for the others.

Taken on the whole, the police force of today is not giving as good service as was given by the force of fifteen years ago. Devery may have been a robber, but he knew police business and policemen. He was fearless, he would not ask a man to go where he would not go himself. He knew his men and they knew and respected him. He knew the good and the bad side of them. They trusted him to treat them fairly and he did. He was a real police chief.

Schmittberger is the uniformed head now. But Schmittberger is only an office boy, doing as he is told by civilian superiors, even though he may know that the orders are bad for the force.

The real head of the New York police should be a man from the ranks who has made his way up by merit. He should have the power and exercise it under supervision, something after the fashion of the old bi-partisan police board. The old bi-partisan board gave better results than the present single-headed commission, and the old patrolman, taking everything into consideration, did better police work than the new man does.

In the old days there was a minimum and a maximum hight for policemen, also a minimum and a maximum age. They had to be courageous and physically capable, they had to know the city, and they were obliged to have and exercise common sense. That was about all and it was enough. They usually got in thru influence of politicians. Sometimes they paid, sometimes they did not, sometimes they paid as high as $1,000 each. It all depended on the politician who secured the appointment. Quite often he was contented with the friendship of the policeman and his relatives. That strengthened him in politics. There was more drinking in the old days, and more graft. But the individual patrolman's graft was a small thing—drinks, cigars, petty presents of money.

That sort of grafting continues at the present time, and the police are not responsible for it. I know a policeman who the other day went in a saloon and asked for a drink of water.

"Take whiskey," said the amiable and hospitable proprietor.

"No, sir. Water, please. I don't drink whisky," said the policeman.

"Here, then, make it ginger ale," said the proprietor, and he filled a tall glass with ginger ale and ice.

"I want water," insisted the policeman. "I'm thirsty." Finally, after much fuss he did succeed in getting a glass of water. The saloonkeeper could not understand how any man could really want to drink water.

Small shopkeepers try to make friends of policemen on their beats, and their way is to give presents. They want special advantages like occupying sidewalks about their premises, or letting their

wagons stand out on the streets. I know policemen who take their baskets and go out and do their marketing without paying a cent, but such men are exceptional, —certainly not more than one out of ten. Most of the policemen are decent, solid men of family. Perhaps the worst thing about them is that they stand together as a unit to cover over any police delinquencies and perjury is very common among them. They lose all sense of the sacredness of an oath.

In order to make the New York police force the best in the world—as it ought to be—it needs a policeman at the head, a man who has risen thru all the grades and who knows police duty and the temper, needs and feelings of the men under him. On this man should rest the general responsibility, and he should have abundant power to wield the great machine under him. He should not be pulled first one way, then another by constantly changing commissioners, with different and often directly conflicting views and policies.

The appointment of such a police chief should not be in the hands of the Mayor. Maybe the result would be better if the police chief were elected. Surely if the people are competent to choose a president or a mayor they are competent to choose a chief of police. At any rate they could not make a worse botch of the matter than the present system does, for we now have complete demoralization. The Rosenthal case showed that.

There were policemen all around when Rosenthal was killed, yet the murderers got clear off and the policemen on the spot did not even note the number of the automobile in which they escaped. That was furnished by a quick-minded citizen who was roughly treated for his pains—and the lieutenant took down the wrong number. Surely there was significance in that. The citizen gave the right figures, the lieutenant at the desk wrote down wrong ones, and but that District Attorney Whitman saw him do it, and insisted upon his making correction the murderers, probably, would have finally escaped. As it was, the attempts of the police to catch them were mostly farcical, and they are now taking credit for having, after a two months' chase, costing hundreds of thousands of dollars, at last arrested "Lefty Louie" and "Gyp the Blood," who all the time were living quietly under their noses. It is only occasionally, and as it were, by accident, that a criminal is caught.

The captains should be held responsible for their precincts and should be given enough freedom of action to enable them to make the best possible disposal of the force under them. As to the patrolmen, they should be held responsible for the condition of their beats. They should not be debarred, as at the present time, from talking to citizens while on duty. On the contrary, the patrolman should be a gossip, knowing all the men and families on his beat. He should know the boys and girls and take a fatherly interest in them. There should be no necessity for truant officers, for the policemen on beat should know the boys who are missing school, and should see the parents about it. If he were the right kind of a man a word from him would settle the trouble. He would see the boy or girl going wrong and take the right steps to pull them straight, he could give a word of advice to parents, and if necessary bring parents to court. Criminals like blackhanders, blackmailers, bomb-throwers, burglars, highwaymen, could not make nests on his beat because he would know every family, and the source of income of every family. He would know all honest workers (too busy for crime), and he would keep a close watch on the others. Such a policeman would soon make himself recognized as the friend of all decent citizens. He should be friendly with the boys and help them to find places in which they could play without doing mischief or giving annoyance.

Two-thirds of the entire police force should be on duty at night and mostly in the congested sections. The deserted business sections do not need so much guarding. At present only three-fifths of the force are on night duty, and more attention is paid to guarding property than to guarding human life.

The New York police force looks fine on parade. The men are well set up young fellows—magnificent material. But even Mr. Waldo's testimony given the other day before the Aldermen's Investigating Committee shows that many

of them are deficient in character, even criminal. Waldo has done away with the police bureau for investigating character of applicants for appointment. Waldo trusts the Civil Service examiners, and there is evidence that the Civil Service examination fails—at least in that respect.

I know very many policemen and officers and like them. I have been watching the force now for forty years. Many of them come to me and tell me what they think and how they feel. A policeman's job is not by any means always pleasant—citizens don't realize—

Now, the other day a friend of mine was on beat and a lady came to him and said:

"Officer, there's a strange dog in our back yard, and I wish you would put him out. He seems to be sick."

All innocently my friend went with the lady and was ushered thru the house into a small back yard where he found himself suddenly confronted by a St. Bernard dog big as a lion and much more dangerous, for he was mad, frothing at the mouth. He flew at the policeman, who finally and by great good luck managed to shoot him dead. The woman had given him no warning of what to expect in her back yard. To her mind facing mad dogs at close quarters was a policeman's duty. And that generally is the citizens' mental attitude toward the policeman. It is his duty to face every danger on behalf of the citizens' peace and comfort. If there is a burglar down in a dark cellar, it isn't the citizen who has to go after him. The policeman is expected to do that, and to do it without any change of countenance—and to his credit he usually does.

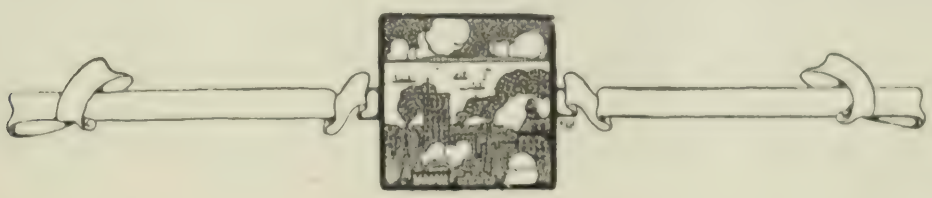
Of course all policemen are not heroes—on the contrary. A poor Homeless Horace was holding up a corner store down by the water front a few nights ago, when along came a policeman and said:

"Come along!"

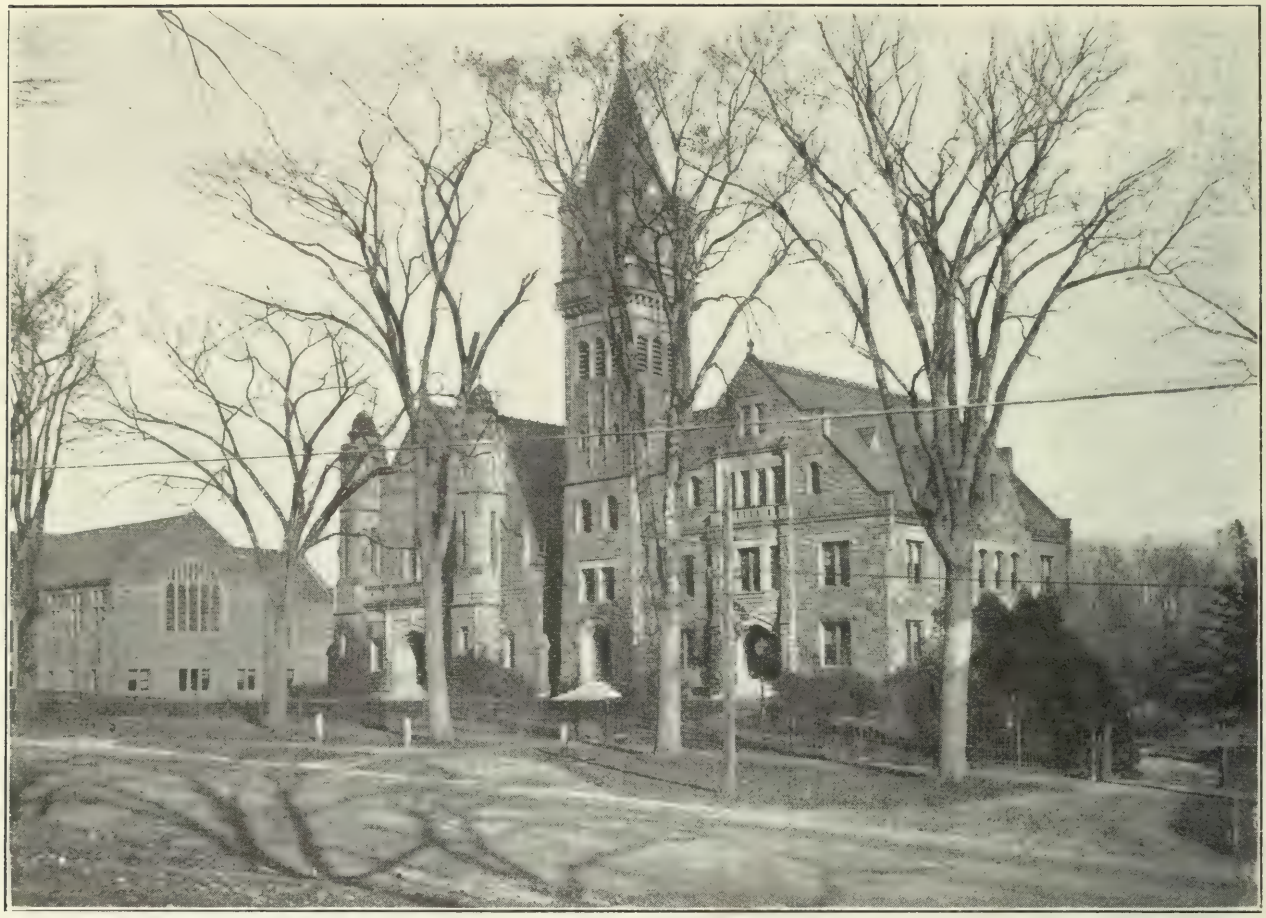
"What for?" asked Horace, "I ain't done nothin'."

"Ye never do. Come along."

He marched Horace down to the end of a dock and threw him off into the river. Then he jumped in and rescued him. Then he went to the station house and reported the brave rescue, and it has gone down in his record with honorable mention. There are a lot of fake rescues from fire and water nowadays.



Taken on the whole, New York is not getting what it is paying for in the way of policing, and it will not receive good service until certain thoro and searching reforms are carried out. This is a summary:



1. A policeman the actual head of the police force.
2. Abolition of the patrolmen's, sergeants', lieutenants' and captains' associations—no unionism among city servants.
3. Restoration of the two-platoon system.
4. At least two-thirds of the force on duty at night, paying most attention to guarding homes and lives instead of property.
5. The captain held strictly responsible for conditions in his precinct.
6. The patrolman held strictly responsible for conditions on his beat.

To bring about these changes will be a good day's work for a full grown man, but such men have sometimes appeared. Just at present the police are sulking. They feel that they are misunderstood and not sufficiently appreciated. Many of them would rather see things go wrong than right in order to "get square with the administration," which they think has humiliated them and gone out of its way to put heart into the thugs and gangsters, their natural enemies. As a matter of fact, they desire to do as they please with or without law, and they have and will have a deep-seated grudge against any one who interferes with their pleasure and convenience.

They are badly in need of discipline and a fine, strong, just commander who knows them thoroly.

New York City.

Mount Holyoke College

BY SUSAN HAYES WARD

[This week Mount Holyoke College, South Hadley, Mass., in its seventy-fifth anniversary gives honor to its founder, Mary Lyon, the most distinguished of all our leaders in female education, and to its own development from a girl's seminary into a college of the first rank. —EDITOR.]

LOOKING back at its beginning, it is evident that no woman could be better fitted to be the founder of Mount Holyoke College than Mary Lyon. Born of Christian parents, on a small farm in Western Massachusetts, the fifth of seven children, and losing her father when a little girl, how unlikely it seems that she could fit herself for such a work! Of her widowed mother she wrote:

"She was not rich in the treasures of the earth. But want at that mountain home was made to walk so fairly and gracefully within that circle of limited means that there was always room enough and to spare for a more restricted neighbor. I can now remember just the appearance of that neighbor as she said one day, 'How is it that the widow can do more for me than any one else?'"

By the time she was seven years old the district school she had walked a mile to attend was removed twice that distance, and she could only go irregularly. When Mary was thirteen years old, her older sisters having married, Mrs. Lyon married again, and removed to Ashfield, taking her two younger daughters with her, Mary remaining with her only brother on the farm. But she struggled for an education, living for short periods with relatives or working for her board in families where she could enjoy school privileges. Her ability to absorb knowledge was marvelous, and she sought instruction wherever a way was opened for her, now under some college professor and again in some neighboring academy, literally working her way. When twenty years of age she was teaching a small country school, receiving as wage 75

cents a week and her board. By that time she had resolved to devote her life to teaching, and with that aim before her the next year found her in Byfield under the instruction of that pioneer in the higher education of women, the Rev. Joseph Emerson, who trained about a thousand New England women, fitting them to be enthusiastic teachers, and sent them broadcast over the country. In after years Mr. Emerson said that in original power, tho not in discipline, she was, in his judgment, superior to any other pupil he had ever had in his seminary.

Miss Lyon often said that she owed more to Mr. Emerson than to any other teacher. Until she came under his instruction her attention had been given to intellectual attainment; in other schools she had learned merely to study and to recite, "not at all as good for the character as Mr. Emerson's." He changed entirely her views of education, and taught her those great principles of action which with wonderful power she afterward inculcated upon her pupils.

It was in 1824 that Mary Lyon joined Miss Z. P. Grant (Mrs. Banister), another famous teacher trained under Mr. Emerson, and, like Miss Lyon, still bettering his instruction. Together they taught a girl's school in Derry, N. H., but in 1828 removed it to Ipswich, Mass. Seven years later this famous Ipswich Seminary had sent out from its walls thirteen missionaries of the American Board, fifty-three teachers in the West and South, and three hundred teachers in New England, New York and New Jersey; for Miss Grant's school was primarily a school for teachers. This seminary was not endowed, and after Miss Grant's and Miss Lyon's retirement, had a hard struggle for existence. For ten years they worked together; a beautiful friendship grew up between them which was helpful to each; one supplied enthusiasm to the neglect of convention, the other judgment and moderation.

The school in Derry had no winter term and Miss Lyon for six years taught a winter school in Ashland or Buckland, which grew till its numbers almost rivaled those of Ipswich Seminary; and here the need of an endowed school for young women in the Connecticut Valley was brought home to her.

In 1834 she closed her connection with the Ipswich school to devote her energies altogether to the raising of an endowment and the establishment of such a school. It was during this year that Judge Wheaton enlisted her interest in his plan for a seminary for young women in Norton, Mass. She visited in his home, suggested plans for the school building and boarding house, and even lent to Wheaton Seminary Miss Caldwell, her chosen and pledged assistant for Mount Holyoke. The story is still told in Norton that Mary Lyon, walking behind loitering schoolgirls when visiting the school in 1835, would urge them forward with the admonition, "Don't dawdle, young ladies."

The story of the first thousand dollars that Miss Lyon raised from women for her new seminary has been often told. Her scholars in Ipswich gave her the first money, $265; the ladies of Ipswich contributed $475; and then, going from house to house and town to town, in less

From B. B. Gilchrist's "Life".—Courtesy of Houghton Mifflin Co.

Mary Lyon

than two months the sum was nearly all secured. Twenty-seven thousand dollars was to be the cost of the new building for Mount Holyoke, and this money was given by eighteen hundred subscribers, the largest contribution being five hundred dollars. That has ever been Mount Holyoke's way. It has not depended for its life upon a few rich patrons, but upon the community at large.

Tho the building was not complete, the seminary opened November 8, 1837. Mary Lyon was then forty years of age. She had studied much, had taught for eighteen years, had cultivated a passion for souls, and knew much of the power of prayer. She was a trained judge of character, could teach the moral and Christian virtues as systematically as she would teach geography, and she believed that character was more important than mere learning. She was fitted to become a pathmaker and set up a standard for crowds of educators who should follow in her steps.

From a letter written November 26, 1837, by a pupil, Nancy Everett, to her home friends, I here make a few quotations. Miss Everett afterward became the wife of John Dwight, the donor of the Dwight Art Building of the college.

This letter is to inform you of the school diet, regimen, teachers and scholars; thinking you might wish to learn how I am situated and what I am doing, I venture to write.

There are just seventy-nine scholars, which, with three teachers, Miss Lyon and the superintendent of the domestic department, make a family of only eighty-four. You can hardly imagine what a formidable line we make going to church or taking our daily walks.

I believe if ever there was a happy family it is this, we are so independent; if we wish for anything or to do anything we are at perfect liberty to do or get it without a parcel of hired girls wishing us out of the way.

The bell rings at five o'clock in the morning to call up those who get breakfast, which consists of potatoes (very nice) and cream, white bread and butter. Sometimes for variety hasty pudding is substituted for the former. It takes fourteen to get breakfast, eight to set the tables, there being five to set—one to make the fires, in the stove, under the set kettles, for dish water, potatoes and washing floors; and in the seminary hall, spaceway and dining room, etc.—then five or six to peel the potatoes. I rise at half-past five every morning, having an appointment from that time till breakfast time. If we fail of being down at the set time Miss Lyon sends up for us. I really do not know when she sleeps, for she is up the first in the house, sometimes before four. After breakfast there is such a number for washing tumblers, of which there is a host, all drinking cold water but five; so many for washing and scouring knives, so many for the crockery of whatever sort, and eight or ten for sweeping the various stairways, spaceways, etc. About the same number for dinner and supper, only different ones. Dinner is made up of roasted beef, codfish and the like, and always a second course of dumplings, pies or puddings; supper of bread and butter, sauce and cake or gingerbread. So you see we live well, yet all is plain.

In the evening there is a circle of ladies that attends to making bread, paring apples for dumplings and pies, washing potatoes for the next day, and another in the morning for making pies and preparing the dinner. I wish you could see the establishment and apparatus connected with it.

After describing the building itself, the writer goes on to say:

Miss Lyon has not yet had much to do with the exercises in school, for she has had enough beside to attend to. Therefore Miss Caldwell takes the lead. I wish you could hear her converse an hour and I think you would be charmed. She gives us a short lecture every morning. . . .

They are very thoro here, more so than I expected. They will make us get our lessons and get them well. I thought I knew something before I came here, but sometimes I feel as if I did not know anything. . . .

Miss Lyon does not attend church in the evening; she does not think it profitable for her, altho she does not discountenance our attending. Miss L. has been reading to us since meeting President Edwards's "History of Redemption." I like it very much, and, oh! I love her. She is in truth one of the Mothers in Israel. We do not begin to see her worth, her piety and talents until we are fully acquainted. Those who best know her say they can hardly feel reconciled to her not being longer in school. She is very careful of our time, so when we are eating she lays down her plans for the day, gives us good advice in regard to our manners at table, toward one another, etc. I have heard her lecture an hour at a time without appearing the least tired. She is not one of those teachers that keeps at a distance, but is around within all our work, ready to rejoice when we rejoice and weep when we weep. I think her eminently pious and also Miss Caldwell and the other teachers. They are what you may call accomplished.

I have quoted enough to show how enthusiastic an early pupil became over Mount Holyoke before it had really settled down to its work, which was then and has always been the development of intelligent Christian womanhood.

Domestic industry was introduced, not to teach housework, but to reduce expenses, so that young women of limited

means might enjoy the seminary's advantages. Possibly the plan at that early date won favor with many plain people, who feared that higher education might unfit women for home life, and no doubt it promoted the democratic spirit that must prevail where all work together. Of late years this characteristic of Mount Holyoke has been greatly modified. Some years ago I asked my young cousin, then a senior in the college, what domestic service fell to her share. She laughingly answered:

"I am the tallest girl in my class, so I dust the electric lamps in the parlor."

Even that easy service may be given up by this time to a hired servant.

Last year the catalog named 144 members of faculty and other officers, assistants, superintendents of buildings, halls, etc., and 754 students. Of the students, 6 were from foreign countries, 17 from the South, 224 from the Middle States, all but 31 of these from New York and New Jersey; 258 from Massachusetts, 89 from Connecticut; 89 from the other three New England States, and 62 from the West. From this we may conclude that New York and New Jersey are gaining on some of the New England States in the matter of the education of girls.

Harvard's Memorial Hall preserves its list of soldiers enrolled during the Civil War. Mount Holyoke has preserved its roll of missionaries, 178 teachers and pupils who enlisted for foreign service during its first fifty years, and it has graduated so vast a number of teachers that it has well been called the mother of schools and colleges. The members of its faculty today represent a high degree of advanced work, and its president is a worthy successor of Mary Lyon, whose works and words make for righteousness.

How many lovers of Mount Holyoke, as they celebrate on the 8th and 9th of this month the seventy-fifth anniversary of its founding, will walk about its noble buildings, enjoy its enchanting views, will recall its beneficent and worldwide influence and echo the Psalmist's exclamation, "Beautiful for situation! The joy of the whole earth!"

NEWARK, N. J.

Recovery

BY HARRIET McEWEN KIMBALL

LORD God, since Thou hast raised me up
When life seemed almost o'er,
To drink again the earthly cup
That Thou art pleased to pour,

Make sweet its taste, I humbly plead,
With grace sufficient still
To meet my still increasing need
To know and do Thy will.

However long, however brief
My added days may be,
Or bring they joy or bring they grief,
All rests, dear Lord, with Thee.

By Thee created and by Thee
Redeemed, regenerate,
Oh, may each day an offering be
For Thee to consecrate!

Claim for Thyself my mortal breath
Till I return to dust;
My soul and body save from death,—
Thou who art all my trust!

Both must be precious in Thy sight
Since Thou didst both redeem;
O love, no love could e'er requite
Less than the Love Supreme!

Could I but feel what Thou hast felt
To make and keep me Thine,
What gratitude my heart would melt—
Melt it, O Love Divine!

And when at last my soul is freed
From this poor house of clay,
In Paradise, I humbly plead,
Prepare me for *That Day!*

PORTSMOUTH, N. H.

A. Wendell Jackson

BY GEORGE L. FOWLER

[The report that the Chinese Government may turn to Mr. Jackson, after negotiating the fifty million loan, to negotiate one for two hundred and fifty millions, makes this article of special interest. Mr. Fowler is an engineer who has intimately known Mr. Jackson for twenty-five years.—EDITOR.]

WHO is A. Wendell Jackson? Why, he is in the limelight as the negotiator of a new Chinese loan. A cultivated, educated gentleman, and whilom professor of mineralogy in the University of California, of which he is a graduate, afterward a student in Leipzig and Freiburg; modest, unpretentious and very far from seeking or enjoying the attention that his latest achievement has thrust upon him. Of course it is a far cry from the exposition of the peculiarities of a gold-bearing quartz or the differences between cuprite and azurite to the placing of a loan of international importance. But the transition was gradual and was preceded by years of what was real, tho quite unconscious, preparation. The first step outside was the negotiation or promotion of a newly discovered chemical product of one of his colleagues. This and the management of the concern based upon that product brought him to the East, and New York has been his home since that time.

Here he has been interested in various enterprises, but the things that were mostly in the foreground, so far as his friends were concerned, were activities that were far from producing revenue or dividends. He was, for example, greatly interested in the affairs of a small Unitarian church in Harlem. He was the superintendent of its Sunday school, the president of its board of trustees, the president of its men's club and one of the prime movers and organizers of the activities and distractions of this lively little congregation. His vigorous strength and abounding activity also led him into many of the pleasures of outdoor sports, and during the bicycle craze he was one of its most ardent devotees. But as a sportsman he was best known, perhaps, among his intimates as a yachtsman. Starting as most such men do, with small craft, he soon became an expert sailor. Once the owner of a steam-propelled houseboat, he was his own captain and held a master's license for the navigation of the waters of New York Bay, the Hudson River and Long Island Sound.

In all of this work and play he seemed to show the traces of that thoroness of investigation and preparation which must have characterized the work that fitted him for the chair of mineralogy in a large university. And it was always interesting to see the scope of his knowledge of the details of those things with which he worked or played. His method seemed to be the acquisition of a knowledge of his subject from his reading, and then the development of it by practical application and practice until every trace of the book had disappeared and he was the full-fledged sailor or Sunday school superintendent, as the case might be. So as president of the men's club he was always posted on the subject of the evening's talk, not pedantically, but naturally and as a matter of course, so that his comments were poignant and to the point.

The same method of systematic careful investigation was also carried into business matters, and he put a great deal of painstaking investigation into everything he undertook, whether it were the construction of a water power or the development of a system of electric traction. So that it was in work and play of this character that he was engaged for nearly twenty years in New York; living quietly and known only to the few who had the pleasure of being associated with him in his play and work.

It was after the Russo-Japanese War that reports were brought to this country of the existence of large bodies of

auriferous ores in Manchuria. These reports came from Russian sources and Russia and presumably Russian subjects being barred from the exploitation of these properties, inquiries came to America. Mr. Jackson became interested in the matter and the meager details that were brought, checking with his own knowledge of mineralogy, showed that the existence of these ores was probable, and he undertook to secure the rights of exploitation for an American syndicate.

To say this is an easy matter, but to do it was the labor and the burden. The task took him to the Orient. But before he went, with his usual thoroness, he paved his way and that of his engineers by securing the co-operation of the State Department at Washington, which took on the very practical form of letters to the diplomatic representatives abroad, at London, St. Petersburg, Pekin and Tokyo, besides to the consulates at the minor Chinese and Manchurian ports, instructing them to assist him in every way that lay in their power.

A. WENDELL JACKSON

It can be readily realized that it was no small thing that he had attempted. With Russia, China and Japan in the field, and each watching like a hungry wolf for a chance to snatch the whole bone; for a simple, quiet American citizen to attempt to secure one of its fragments would require diplomatic skill and fighting qualities of a high order. And aside from a cursory examination of records, he could hardly go into the field until he had made his peace with the powers at St. Petersburg, Pekin and Tokyo. Then came the long and weary effort to fathom the intricacies of Chinese titles and local prejudices and customs, all of which brought him into such close touch with all classes and conditions of that people from the viceroy of a province to the peasant working in the fields, that he acquired at first hand a knowledge of Chinese character and Chinese methods that especially fitted him for the undertaking of his latest achievement.

Then he went to Japan, and for a number of years has made, it cannot be called his home, but his headquarters at Tokyo. He became really a resident of the city, and lived in a house of his own, in the Japanese fashion, surrounded by Japanese servants and in close daily personal contact with the official and business classes in the community until he had learned the Japanese point of view to the full. In this he was especially close to the development of the Tokyo railways.

Those who know him, and know of the care with which he fortified himself in his yachting days, when he sailed a little sloop flying the pennant of the New York Yacht Club, with all the lore as to the rigging of full-rigged ships, and how well he knew every rock and shoal and channel in the waters about the city, can appreciate the interested thoroness with which he must have undertaken this campaign of informing himself as to all the whys and wherefores of the Oriental point of view. And with his broad knowledge of human nature, and still broader sympathies with all of its vagaries and idiosyncrasies, it is not difficult to see how fully and perfectly he could accept their point of view and be guided thereby in everything affecting their interests, regardless as to whether those interests were of morals, religion or finance.

Then he has the habit of telling things as they are, or as he thinks they are, and the two are usually in agreement. Points that are of supreme importance, when it comes to such matters as the negotiation of a national loan.

This, then, in fine, is the story of the situation. Mr. Jackson did not leap a full-armored diplomatic negotiator from untrained obscurity, but for many years has been building up in experience for the task. He has been in close touch with the bankers of New York and London for many years, starting with the exploitation of the chemical product in his university days, and knows well the avenues by which they may be approached, as well as those by which their doors are blocked. He knows the Chinese, too, as only a man who has lived and worked among them can know them. It was a peculiar combination of first-hand knowledge that was demanded for this negotiation—a knowledge needed that each principal of the transaction might appreciate the position of the other, and so modify personal prejudices and methods as to make a union on a common ground a possibility. And this could only be accomplished by a man imbued with great powers of observation and adaptability and one who puts his whole soul into whatsoever he may undertake.

So this is given to answer the question as to who is A. Wendell Jackson, and to show that he is not a chance happening, but the development that chance, to be sure, has thrust into the limelight, of a long series of years of careful investigation and training in a peculiar field.

New York City.

Literature

London and Labrador

You never can tell what Mr. H. G. Wells is going to do next. We suspect him sometimes of laughing in his sleeve at his public, a very disrespectful thing to do His recent novels, "Ann Veronica" and "The New Machiavelli," dealt so frankly and tolerantly with aberrant modes of matrimony as to alienate many of his old admirers and to threaten a boycott by the British public libraries. Under the circumstances, the announcement that his next novel was to be entitled *Marriage** could not fail to arouse the worst of apprehensions as to its probable character. What effect these apprehensions had upon the circulation of the magazines in which it has been appearing serially during the year can only be surmised, but it can hardly be doubted that many readers were disappointed, in one way or the other, when month by month unfolded a story of unobjectionable character, as stories go nowadays.

The Traffords are exceptionally decent people, and if their marriage is not a success it is not on account of any interference from a third party, but rather because of the cares and complications that come from family life and financial prosperity. The heroine is a charming specimen of the modern young woman, educated at "Oxbridge," whose chief fault is a constitutional inability to keep her accounts straight. She spends money with excellent taste, but without regard to her husband's bank balance. Consequently Trafford has to lay aside his researches in molecular physics to work out a successful process for synthetic rubber—easy to a man of his ability.

Mr. Wells apparently adopts the theory formulated by Professor Devine, of Columbia, as to the normal division of labor between husband and wife, that men should be experts in the art of getting money and women experts in the art of spending it. Where both parties fail is in regarding these duties as ends in themselves, the men getting absorbed in business and the women buying things that they do not want, that nobody needs, just for the sake of buying. Apparently Mr. Wells has hope of curing the men, but none of curing the women.

Premature attempts at realization, the demand for immediate results, the disregard of purely scientific research, the swamping of life by restless activity and futile efforts at reform, these are the ailments of the modern world, according to our author. His satire spares neither conservatives nor radicals. The following passage reminds us of what Mrs. Harris wrote for THE INDEPENDENT about "World Movements in New York" a few years ago:

"London, of course, is always full of Movements. Essentially they are absorbents of superfluous feminine energy. They have a common flavor of progress and revolutionary purpose, and common features in abundant meetings, officials, and organization generally. Few are expensive and still fewer produce any tangible results in the world. They direct themselves at the most various ends: the poor, that favorite butt, either as a whole or in such typical sections as the indigent invalid or the indigent aged, the young, public health, the woman's cause, the prevention of animal food, anti-vivisection, the gratuitous advertisement of Shakespeare (that neglected poet), novel but genteel modifications of medical or religious practice, dress reform, the politer aspects of socialism, the encouragement of aeronautics, universal military service, garden suburbs, domestic arts, proportional representation, duodecimal arithmetic, and the liberation of the drama. They range in size and importance from campaigns on a Plessingtonian scale to sober little intellectual Beckingham things that arrange to meet half yearly and die quietly before the second assembly. If Heaven by some miracle suddenly gave every Movement in London all it professed to want, our world would be standing on its head and everything would be extremely unfamiliar and disconcerting. But, as Mr. Roosevelt once remarked, the justifying thing about life is the effort and not the goal, and few Movements involve any real and impassioned struggle to get to the ostensible object. They exist as an occupation; they exercise the intellectual and moral activities without undue disturbance of the normal routines of life. In the days when everybody was bicycling an ingenious mechanism called Hacker's home bicycle used to be advertised. Hacker's home bicycle was a stand bearing small rubber wheels, upon

*MARRIAGE. *By H. G. Wells.* New York: Duffield & Co. $1.35.

which one placed one's bicycle (properly equipped with a cyclometer) in such a way that it could be mounted and ridden without any sensible forward movement whatever. In bad weather, or when the state of the roads made cycling abroad disagreeable, Hacker's home bicycle could be placed in front of an open window and ridden fruiously for any length of time. Whenever the rider tired, he could descend—comfortably at home again—and examine the cyclometer to see how far he had been. In exactly the same way the ordinary London Movement gives scope for the restless and progressive impulse in human nature without the risk of personal entanglements or any inconvenient disturbance of the milieu."

To accomplish a cure, or at least to obtain a diagnosis of the evil, Mr. Wells resorts to a curious expedient which he suggested first in his "Modern Utopia," where he laid down as one of the rules of his new order of Samurai that a man who aspired to be a leader of men should for a week every year go off into the desert and live absolutely alone, without books or other distractions to keep him from thinking. But in *Marriage* Mr. Wells improves upon this plan, for Trafford and his wife go into the wilds of Labrador together. "How sweet is solitude," as the Irishman said, "when you have your sweetheart with you." So, indeed, they found it, and in their fight with cold, starvation and wild beasts they learned how to found their love upon mutual comprehension and respect, and made of their marriage a true union. The change of heart which Trafford experiences is not altogether unlike what Christians call conversion. His line of argument, or, more properly speaking, development of thought, finds expression in fragmentary sentences muttered in the delirium of fever, a Freudian emergence of fundamental feelings, as in the following passage:

"Of course," he said, "I said it—or somebody said it—about this collective mind being mixed with other things. It's something arising out of life—not the common stuff of life. An exhalation. . . . It's like the little tongues of fire that came at Pentecost. . . . Queer how one comes drifting back to these images. Perhaps I shall die a Christian yet. . . . The other Christians won't like me if I do. What was I saying? . . . It's what I reach up to, what I desire shall pervade me, not what I am. Just as far as I give myself purely to knowledge, to making feeling and thought clear in my mind and words, to the understanding and expression of the realities and relations of life, just so far do I achieve salvation. . . . Salvation! . . .

"I wonder is salvation the same for every one? Perhaps for one man salvation is research and thought, and for another expression in art, and for another nursing lepers. Provided he does it in the spirit. He has to do it in the spirit. . . .

"This flame that arises out of life, that redeems life from purposeless triviality, *isn't* life. Let me get hold of that. That's a point. That's a very important point."

These suggest that Wells's thought is entering upon a new phase, considerably in advance of that revealed in his "First and Last Things." He seems to be working toward some sort of belief in God, a Bergsonian God, struggling upward in spite of and by means of inert matter and recalcitrant humanity. It would indeed be queer to find Wells not only among the prophets, but among the Christian prophets, and, as he intimates, some of the other Christians would not like it. In some respects his latest novel is his best. He shows in it the same craftmanship, the shrewd observation of human traits and the flexible style that has always distinguished his novels, while his vision has widened and clarified. And his solution of the marriage question, if not capable of universal application, is at least original. Labrador is certainly preferable to Reno as a resort for disharmonious couples.

EDWIN E. SLOSSON.

The Mystery of Socialism

"WHAT is truth?" said jesting Pilate. And he would not wait for an answer. "What is Socialism?" asks the earnest student. And the longer he waits the more confusing the answer. New varieties develop each season. A fresh lot of books about them is issued each spring and autumn. Socialism has well passed the stage of being merely a term of reproach. When the young inventor, in 1886, in the play "Milestones," is discovered to be a disciple of William Morris and a Socialist, the well-bred English family whose daughter he is courting is so horrified that its hair stands on end and his proposal is rudely squelched. Up to the twentieth century that was also the attitude of well-fed America.

But we have changed all that, and here are actually two college textbooks on the dangerous subject, with questions at the end of each chapter, a bibliography, aca-

demic paragraphing and all the other insignia of the classroom. The work by Professor Cross[1] is a brief, objective exposition, free from advocacy or condemnation. *The Elements of Socialism*[2] expounds a doctrine which has been disinfected. In this and his other work, *Applied Socialism*,[3] Mr. Spargo abandons, in the name of Socialism, the greater part of the teaching which made Socialism a bogey. The wild beast of the jungle, red in tooth and claw, turns out to be a well-mannered pussy. Without winking or blinking, Mr. Spargo announces that "equality of remuneration . . . is by no means an essential feature of the economy of Socialism"; tho that free lance Socialist, the irrepressible George Bernard Shaw, has recently contended, to the so-called "conservative" Socialists of the English Fabian Society, that by no other means than equality of remuneration can a just distribution be attained. Mr. Spargo also declares it to be axiomatic that "Socialism would not do away with the private accumulation of surplus income, nor, necessarily, with the inheritance of such accumulations." Nor does Socialism make any such preposterous claim as that "Labor is the source of all wealth." Indeed, Socialism explicitly declares, as against ignorant labor demagogs, that labor is *not* the source of all wealth. Further, no Socialist of repute advocates the confiscation of those mines, factories and the like which a Socialist state simply must own. The transition from a capitalist to a Socialist state would be eased by "paying the owners of property for whatever is taken from them." That should be pleasant for the expropriated. Government bonds in exchange for business cares would be no hardship—except to the community which had to pay interest in perpetuity.

As to marriage and the family, why, bless your life, Socialism has absolutely no theory about marriage or the family. The subject is entirely beyond its purview. It even loathes the endowment of motherhood which Utopian Socialists like Mr. H. G. Wells so naïvely advocate. (Those literary fellows are strangely guileless and credulous). For if mothers are paid for bearing and rearing children the state would want to determine the number and quality of the babies, and a tyrannous, bureaucratic control would result, and expurgated Socialism dreads state control.

Mere public ownership is not Socialism and "may not even be an approach to Socialism." How should it when, *pace* Spargo, the Socialist state will include private production and co-operative production (both for profit) as well as public production? What then remains of that ancient bugaboo, revolutionary Socialism? Wherein lies the fundamental distinction between Socialism and the existing order? Truly it is hard to discover. For Mr. Spargo, with an eye on the party committees and no wish to depart into outer darkness along with the excommunicated, backs up every one of his concessions by an appeal to the sacrosanct scriptures of Karl Marx.

Realizing our perplexity, Mr. English Walling has written 430 compact, learned pages to reveal Socialism as it really is.[4] If Mr. Spargo has lulled our fears Mr. Walling awakens them afresh. Alas! that revolutionary beast is not a tabby cat. It turns out to be fiercer, wilder, craftier, stronger than ever, a terrible creature that Mr. Walling has seen, veritably seen, while Wells, Spargo, Arner and the rest were sporting with a domestic pet. Roosevelt, Hearst, Lloyd-George and the other politicians who frighten peaceful householders with their "Socialist" proposals (Socialist, forsooth!) are mere capitalist reformers, with no more notion of what Socialism is than a bunch of kittens. Socialism, my friends, is a *class war!* There! Doesn't that scare you? Syndicalism in France, Tom Mannism in England and Bill Haywardism in America are ushering in the new era, the real Socialist, the rule of the proletariat. It is not here yet; but it is coming, as sure as Christmas. Everything depends on the Socialist organizations and the more explosive of the trade

[1] THE ESSENTIALS OF SOCIALISM. *By Ira B. Cross.* New York: The Macmillan Company. $1.

[2] ELEMENTS OF SOCIALISM. A Textbook. *By John Spargo and G. L. Arner.* The Macmillan Company. $1.50.

[3] APPLIED SOCIALISM. *By John Spargo.* New York: B. W. Huebsch. $1.50.

[4] SOCIALISM AS IT IS. *By English Walling.* The Macmillan Company. $2.

unions. Not the unions of the Gompers school. They are not class conscious; not ready to inaugurate the millennium with a bang. But the Industrial Workers of the World. They are the stuff. They are not too squeamish about ways and means and ready to fight with both bullet and ballot. Don't be deluded by milk and water reformers. As yet "no government has taken any step whatever in the direction of the Socialist policy." That is truly discouraging. If the most aggressive democratic governments in the world have not made one step in the direction of this ideal after half a century of propaganda, either the people are incurably stupid, the ideal is incomprehensible, or (can it be?) Mr. Walling is utterly mistaken.

Weary of this strife, Mr. H. G. Wells and his fellow essayists have renounced the term "Socialism" and use *The Great State*[5] as the label for the ideal commonwealth. With his famous literary deftness Mr. Wells, in his preliminary chapter, which is worth all the rest of the book, opens up wide new vistas. From Olympian hights, far above the mists and narrow valleys that confine professional Socialists, he surveys the life of mankind and suggests the road which would lead to a nobler existence. He foresees "a social system no longer localized, world wide in its interests and outlook and catholic in its tolerance and sympathy, a system of great individual freedom with a universal understanding among its citizens of a collective thought and purpose." How to get there? The exact route has never been mapped. Even within the volume there are conflicting directions. One guide says that meals must be furnished school children because women in the home today are so dreadfully overtaxed. Another alleges that woman's industry has been removed from the home and she is left workless and dull. But, despite such imperfections of editing, the volume is worth attention for its freshness and good will. Perhaps an agreement about Socialism is as impossible as a union of all the churches; but it is a good omen that so many thinkers and writers are busy upon the plans for a new world.

[5]Socialism and the Great State. *By H. G. Wells and others.* New York: Harper & Bros. $2.

Mary, Mary. By James Stevens. Boston: Small, Maynard & Co. $1.20.

The American publishers of this novel by an Irish poet who writes in English tell us that this is "the first Dublin novel," and quote an English reviewer who finds in its descriptions "all Dublin, and almost all Ireland." Infinitely more important from the standpoint of the reader is the fact that the book is instinct with charm. The pleasant admixture of sentiment and quiet humor of which Mr. Stephens possesses the secret would endear almost any scene, and Mr. Stephens is obviously an artist. As a study of personality and manners, modest both in method and subject, *Mary, Mary* merits comparison with Barrie on the one hand and with some of the French romancers on the other. If this seems to the reader something of an overstatement, the reviewer will not try to justify himself; he will only insist that here is a thing of delicate and wistful beauty no less grateful after the stridency and of contemporary fiction, than the voice of a young girl, heard in the lull of a conversation between 'longshoremen. Mary's mother is a highly imaginative and improvident charwoman who lives in a garret and fills her daughter's head with what any Yankee would call mischievous nonsense. There is, however, no real mischief in Mrs. Makebelieve. She is even a good woman in her faulty way, and in the sequel, which is hinted at, she is likely to prove extravagantly generous to all her neighbors and the servants. As it is, she loves Mary as well as the reviewer does. (This is saying a good deal, too—tho for that matter one loves almost all these characters.) But it isn't strange, this mother-love; nor is that of Mrs. Cafferty's thin young lodger with the expensive appetite—to say nothing of the big red policeman in Grafton street. As for ourselves, it is not only that Mary herself is very good to see, and sweet besides, but also that she needs love. Furthermore, we have Mr. Stephens to reckon with, and he tells us, in his mildly humorous and wholly affectionate way, of Mary's gentle entry into the cruel divinity of womanhood and love; a theme for a poet if ever there was one. There is nothing realistic about this novel except a hundred little intimate touches that

prove the author's observation and understanding. Why, it even ends happily —or *stops* happily; which shows what a poor thing it is. We stick to generalities, you see: under no circumstances shall the plot be analyzed. There is so little plot that it must all be saved for the delighted reader. True, not every reader *will* be delighted; for not every reader deserves *Mary, Mary*. Mr. McCutcheon's admirers will be one with Mr. Chambers's in calling the book slow, and any one who values David Graham Phillipics very highly may be expected to find it deficient in "red blood." We recommend Mr. Stephens to those persons who do not read a novel a week, or a novel a day. May they find his little story at once restful and winsome.

Outdoor Philosophy. By S. D. Kirkham. New York: G. P. Putnam's Sons. $1.50.

Mr. Kirkham's essays seem to come under the term philosophy only in its broadest acceptation, for, as he warns us, they preach no doctrine, but only seek to relate how nature touches the author's sensibilities. If he makes any preachment it is in praise of privacy, of the value of retirement and scrutiny of ideas. This is not particularly novel as advice; nor do the impressions reported by this philosopher, when he has placed himself in receptive mood out of doors, seem very different from those of ordinary folks; yet for "naturalists" in his state of mind his cogitations will no doubt form excellent reading. A paragraph on page 109 gives a fair idea of both method and result:

"There is no better seat than a log in the woods, and, while it is comfortable enough, its chief advantage is of a subtle character—a certain power to transport one to an enchanted world, not of marble palaces, but of woodland quiet. Only those whom the genii serve are thus carried away. I have more than once sat upon a log with some intruder in the woods and found myself sailing along while he remained stolidly behind. From my log I have observed the home life of birds and their racial and family aversions and prejudices; have watched their expressions and read their simple emotions. I have come to have a feeling for plants so that I sometimes *sense* them, which is merely the result of associating various types, not only with each other but with certain natural environments, and also with their insect visitors Yet some people wonder what there is to do in the woods if you do not take a gun."

The Evolution of the Vertebrates and Their Kin. By William Patten. Cloth, royal 8vo, 486 pages, illustrated. Philadelphia: Blakiston. $4.50.

That the genealogy of the vertebrates leads back to an arthropod as its ancestor, and more particularly to the arachnids of paleozoic times, is the thesis to which Dr. Patten devotes this imposing volume. This zoölogist has developed his theory in scientific periodicals thru the last twenty-five years; and has not been dismayed by the little attention paid to it by naturalists, for he is convinced of its adequacy to explain the progress of vertebrate evolution. The right key to the problem, in his belief, is to be sought in the development (phylogeny) of the head—an arthropod head to which a vertebrate body has been added. The two principal connecting forms between primitive and recent types are the eurypterids, merostomes (Limulus) and the ostracoderms (mailed "fishes"). In his view those resemblances which have led morphologists to trace vertebrate lineage back to anellids, echinoderms, tunicates, etc., are themselves due to offshoot developments of the arthropod stock in its early stages. Whatever the outcome, Dr. Patten has here furnished naturalists with a mass of demonstrative material, plentifully and admirably illustrated, which he offers as evidence, so that no one need be at a loss to know the foundations of the argument.

Literary Notes

....Devotees of the kodak will welcome *Photography Outdoors* (New York: Tennant & Ward; 60 cents). It is a concise treatise on the methods and conditions most favorable for obtaining reproductions of the beauties of nature. Specific directions are given for focusing the camera and regulating the exposure.

....The present Presidential campaign differs from previous ones in that the party platforms really mean something and are not all alike. Their points of difference and significance are most strikingly brought out in the pamphlet just published under the title of *The Five National Platforms*, dissected, classified and indexed by William George Jordan. (New York: Jordan Publishing Company, 172 West Eighty-first street. 25 cents.) This ingenious scheme shows at a glance just where each party stands on any given issue.

....In *The Christian View of the Old Testament* (Eaton & Mains; $1), by Prof. Frederick Carl Eiselen, one finds a popular and reliable presentation of the critical, archeological and historical work that has been done recently in connection with the Old Testament and judicious estimates of its results upon the trustworthiness and inspirational use of the Hebrew Scriptures. The author has, however, failed to grasp the full significance and illuminating value of comparative religion in Old Testament study.

....*Four Hundred Good Stories*, by R. R. Whiting (Baker & Taylor; $1), are the cream skimmed off many issues of the "Under the Spreading Chestnut Tree" department of *Everybody's Magazine*. Like other "four hundreds" the aristocracy of jokes contains both parvenus and descendants of ancientest lineage side by side. On the whole the "four hundred" must be regarded as a real aristocracy in the original Greek sense, for the average merit of the collection is high.

....The book which Phœbe Allen calls *The Last Legitimate King of France—Louis XVII* frankly owes much to a French work of approximately the same title, by Henri Provins (Foulon de Vaulx). The writer believes in the identity of Louis XVII and the pretender Naundorf, whose heirs have made a stir in recent years. The argument runs that the Dauphin was removed from the Temple; that his death certificate was forged; that the child substituted for him in the prison was poisoned. One of the illustrations shows us the grave of Miss Allen's Louis XVII at Delft—where he was buried in 1845. It makes an interesting romance—tho the material is ill enough digested. (Dutton; pp. 432; $5.)

....From Macmillan comes a handsome book of Dramatic Poems (revised and enlarged) by W. B. Yeats, the second volume in his *Poetical Works* (pp. 533, $2). "I have always looked upon the play written to be read only as an imperfect form," writes the Irish poet. While Lady Gregory has made "joyous, extravagant, and, as I am certain, distinguished comedy out of the common life of the villages," Mr. Yeats has chosen his themes "from Irish legends or Irish history." As he avows, almost all his plots and personages are out of Lady Gregory's "Gods and Fighting Men" and "Cuchulain." Here, then, we may properly note the publication of several plays by Lady Gregory herself, called, for some reason, *Irish Folk-History Plays* (pp. 207, 196; Putnam; $1.50 each). The two volumes of the American edition are dedicated, respectively, to Theodore Roosevelt and to Mr. John Quinn, patron of art and adviser of the Tammany chieftain.

Pebbles

The question is whether Flinnsylvania is better than Quaysylvania or Penrosylvania.—*Florida Times-Union.*

TEACHER.—What is velocity, Johnny?

Johnny.—Velocity is what a fellow lets go of a wasp with.—*Pathfinder.*

TWEENIE ANN.—Oh, mum, I've fallen downstairs and broken me neck.

Her Mistress.—Well, whatever you've broken will be deducted from your wages.—*Sketch.*

THE sins of our youth certainly follow us. Now it is charged that Woodrow Wilson wore side whiskers when he sang tenor in the glee club.—*Cincinnati Commercial Tribune.*

JOSEPH H. CHOATE, at the Three Arts Club benefit at the Republic Theater, in New York, told this after his witty speech:

"Two young girls were drinking tea when a young man past. As he past the first girl blushed, displayed a beautiful ring on her white hand, and murmured: 'Well, Jack and I are to be married Easter week.'

"'But, said the other girl, 'I thought you had thrown Jack over!'

"'Oh, so I did,' the first replied; 'but—but you know how a girl throws.'"—*Washington Star.*

To run a newspaper all a fellow has to do is to be able to write poems, discuss the tariff and money questions, umpire a baseball game, report a wedding, saw wood, describe a fire so that the readers will shed their wraps, make $1 do the work of $10, shine at a dance, measure calico, abuse the liquor habit, test whisky, subscribe to charity, go without meals, attack free silver, wear diamonds, invent advertisements, sneer at snobbery, overlook scandal, appraise babies, delight pumpkin raisers, minister to the afflicted, heal the disgruntled, fight to a finish, set type, mold opinions, sweep the office, speak at the prayer meetings, and stand in with everybody and everything.—*The Wabash Pearl,* Palestine, Mo.

THE early rising customary on the farm is often a source of comment to those whose occupation does not require it. The palm for early rising, however, must be given to a Kansas farmer.

"I reckon," said the first farmer, "that I get up earlier than anybody in this neighborhood. I am always up before three o'clock in the morning."

The second farmer said he was always up before that and had part of the chores done. The first farmer thought he was untruthful, and decided to find out. A few mornings later he got up at two o'clock and went to the neighbor's house, rapped at the back door, and the woman of the house opened it. "Where is your husband?" asked the farmer, expecting to find the neighbor in bed. "He was around here early in the morning," answered the wife, "but I don't know where he is now."—*Grove County Advocate.*

The Independent

Entered at New York Post Office as Second Class Matter
Publisher, Clarence W. Bowen
130 Fulton Street - - - - New York

A WEEKLY MAGAZINE FOUNDED IN 1848
One Year, $3.00 Single Copies, 10 Cents

Single copies over six months old, 25 cents. Postage to any foreign country in the Universal Postal Union, $1.75 a year extra; to Canada, $1.00 extra. Subscriptions will be received for other periodicals, and clubbing rates will be granted as low as those offered by any responsible agency.

An order for the change of an address should be received two weeks before the change is to take effect. The old as well as the new address should be given.

For the convenience of our subscribers we will send on receipt of the publisher's price any book reviewed or advertised in our columns.

Volumes of The Independent are completed at the end of December and June, and a full index is furnished free on application. Neat binders holding in book form thirteen current issues will be furnished for 45 cents.

If the numbers comprising any semi-annual volume are returned to us prepaid in good condition with $1.50 we will bind the volume in handsome and substantial half buckram and deliver it free anywhere in the United States.

We are always glad to receive articles for examination, but writers desiring the return of their manuscripts, if not accepted, should send a stamped and addressed envelope. Even so, we cannot hold ourselves responsible for their return. Authors should preserve copies of their manuscripts.

Advertising rates will be furnished on application.

The Parties Compared

WHEN a voter is to cast his ballot he has to consider two things, one the principles involved in the campaign, the other the personal character of the candidates. Circumstances may make either one of these considerations paramount. Sometimes the candidate's character may be such that a conscientious voter cannot bring himself to vote for him, however much he may be devoted to the principles of the party; or it may be that the present aim and past history of the party is such that the voter will feel compelled to vote for a candidate who he believes will carry out its principles, while he disbelieves in the man; just as a soldier may be ardently devoted to a commander whom he knows to be personally profane and immoral. Fortunately, in the present political campaign, the three principal candidates are men of unblemished personal character. Of Governor Wilson we have never heard anything worse charged than that he is a schoolmaster; of President Taft only that he lacks *drang und sturm;* and of ex-President Roosevelt that the quality which Taft lacks he possesses in superfluity. Wilson is academic, Taft is yielding, and Roosevelt conceited and imperious—this is the worst that is said of the three candidates. In each case it is their enemies that offer these criticisms. Wilson is not pedantic; Taft is not weak; and Roosevelt has the merit of a full confidence in his opinions. The voter will be excused if he discards the personal element, tho even here not unimportant, and is governed by his judgment of the political issues involved.

To this, then, we invite the attention of our readers, and we ask them what they believe as to the points on which the three parties differ. We do not now take into consideration the Prohibitionist or the Socialist party. The personal character of these candidates is of no importance, for they cannot be elected, and those who support these two minor parties are so devoted to them that they can see no good in any one of the three major parties, and they must regard their principles vastly more important than the personality of the man for whom they have chosen to vote. Their loyalty is to the party, not to the man.

For a fair comparison of the claims of the three parties it will be fair to note what they say of themselves and what they omit to say. They put their claims before the country in their platforms, making pledges of what they will do if entrusted with government by the people.

We observe, first, that the three parties all claim to be progressive, but in different degrees, the Republican, progressive, the Democratic more so, and the Roosevelt party, which takes the name Progressive, most so. So the Republican is called conservative by the Progressive party, and the latter is called radical in turn. We observe, also, that the Republican platform was the first to be constructed, and the two others, following, have added specifications to cap whatever they have found progressive in the earlier platform or platforms. Particularly the Progressive platform has annexed whatever seemed good also in the Socialist party's platform.

The first point on which the three platforms appear to differ is on the tariff. We say that they appear to differ, for it

is more in appearance than in reality. The Republican and the Progressive parties both declare their faith in protection, while the Democratic party declares definitely against protection, and for a tariff for revenue only. Here would appear to be a sharp line of cleavage. Says the Democratic platform:

"We declare it to be a fundamental principle of the Democratic party that the Federal Government under the Constitution has no right or power to impose or collect tariff duties, except for the purpose of revenue."

That is as positive as it can be made. "No right or power." The Republican platform says just as bluntly, "We reaffirm our belief in a protective tariff." But the contradiction is chiefly in words. The Republican platform declares that "some of the existing import duties are too high, and should be reduced"; that "readjustment should be made from time to time" "to reduce excessive rates"; while the Democratic platform, while declaring that the high tariff is the cause of high prices and of the inordinate wealth of a few, yet calls for "an immediate downward revision" "that will not injure or destroy legitimate industry." In theory the two platforms are in opposition; but in application there is no serious difference. There would be very little difference in the concrete reduction desired.

And yet there is a difference that is serious. The Democratic party wants "immediate reduction"; the Republican party wants reduction as soon as an impartial tariff commission can report what is the difference in the cost of production at home and abroad. If this is conservatism, then the Republican party is conservative in that it would look before it leaps. To our mind, that is simple prudence. We do not want again a succession of hard times caused by recklessness in tariff reduction. We had the experience with the Wilson tariff and we do not like it. Such a tariff revision we hold that President Taft was justified in vetoing. He would willingly have signed the special tariff bills of the late session, just as they were, if he could have had expert testimony that they were reasonable and safe. Here we agree wholly with the Republican platform and the Progressive platform, which is just the same. The Republican position is progressive and safe; the Democratic position is rash. It does not "slow down" and is in danger of jumping the track. Nor do we believe in the strict Democratic theory. Our Government has for a century levied a tariff for protection as well as revenue, and to say that the Constitution gives "no right or power" to do what every nation can do must seem absurd. It is proper to argue against protection as a financial policy, but it is futile to declare that it is unconstitutional. On that matter we hold with Daniel Webster, the great expounder of the Constitution, and with the succession of justices of our Supreme Court.

A second point of difference between the platforms has to do with their relation to the Constitution. On this the Republican platform has not a word to say. It did not occur to its writers to criticise it. The Democratic platform simply approves the amendments proposed by the Democratic House and the Republican Senate authorizing an income tax and the popular election of Senators. But the Progressive platform takes more radical ground. It not only pledges the party "to secure such alterations in the fundamental law of the several States and of the United States as shall secure the representative character of the Government," implying that the Government is not now representative, but it adds the following startling pledge:

"The Progressive party, believing that a free people should have the power from time to time to amend their fundamental law so as to adopt it progressively to the changing needs of the people, pledges itself to provide a more easy and expeditious method of amending the present Constitution."

In the view of the party the present way of amending the Constitution is too deliberate; it should be done "expeditiously." Now, the very purpose of a constitution is to prevent expedition. We need no constitution if it can be changed expeditiously. We might as well have no Constitution, only laws. On this subject the Progressives agree with the Socialists, who have put a similar plank in their platform. We believe our sober and intelligent readers will approve in this matter the conservatism, if

you will call it so, of the Republican and Democratic parties.

The Progressive party goes even further; it declares that when in any State its supreme court shall declare a State law violates its State Constitution, the people shall have "an opportunity to vote on the question whether they desire the act to become law, notwithstanding such decision." This proposition utterly subverts the very purpose of a constitution. It applies, to be sure, to the subordinate State constitutions, and not to the national Constitution, but the principle would equally apply. Passing, for the present, the question whether a national convention should meddle with State matters, we are still so old-fashioned as to hold that constitutions, whether of a nation, a State, a corporation or a debating society, should be amended in the regular way, and not violated and annulled at pleasure. As well have no constitution. Here the Socialists succeed in going a little beyond the Progressives; they demand the abolition of the power of the Supreme Court to pass on the constitutionality of acts of Congress.

Another important question of difference between the three parties is that of initiative, referendum and recall. The Progressive, Prohibition and Socialist parties briefly and positively favor these measures; while the Democratic and Republican parties are silent, doubtless because there is no unity of sentiment; many favor and many oppose. We have been inclined to favor these measures, which will bring the people into closer touch with legislation. We often apply the referendum at present. The people ought to have power to initiate legislation if the legislature is delinquent. The recall is a more debatable matter, and seems unnecessary in short terms of office, such as most are; for within the suitable period of deliberation and discussion the term of office will expire. But the case is different with judges. The Republican platform declares the recall of judges "unnecessary and unwise." It may surprise our readers that the Progressive platform makes no such specific mention of the recall of judges as has the party's candidate, but it makes no exception as to recall. It is also to be noticed that it is only as to States that it urges the initiative, referendum and recall, not as to Federal officials and legislation. The recall of judges by popular vote is utterly indefensible. Impeachment for definite offense is enough.

Another debatable subject on which the Republican platform is silent is that of popular primaries. On this the Democratic and Progressive platforms partly agree. They both declare for nation-wide preferential primaries for candidates for the Presidency; and the Progressive platform goes further, and declares for "direct primaries for the nomination of State and national officers." We presume the reason why the Republican dodges the matter is because its framers did not think the experiments thus far made are sufficiently conclusive as to its wisdom. It has proved expensive and seems to give occasion for improper use of money, while it invites ambitious and unscrupulous men to seek office. Nevertheless we have been inclined to hope that proper guards can be found to avoid these evils. Certainly a direct appeal to an intelligent people is ideal and should be encouraged. At the same time the results thus far justify or at least excuse the hesitation which characterizes the platforms of both the old parties.

The Democratic platform begins its pronouncement on Corporations and Trusts with the assertion, "A private monopoly is indefensible and intolerable." There are many private monopolies that are defensible and tolerable. Such are all patents and copyrights. Even competition may be so extravagant as to be deadly, while there are conditions under which the consolidation of business may be for the benefit of the public. But the Democratic platform knows nothing of this. It shows no distinction. It begins by asking for the rigorous enforcement of criminal as well as civil law against trusts and trust officials; demands legislation which shall "make it impossible for a private monopoly to exist in the United States"; forbids all holding companies and interlocking directors, as well as stock watering; provides legislation to put new force into the Sherman Anti-Trust law; and favors legislation to "prohibit railroads, express, telegraph and telephone companies from

entering into any business that shall bring them into competition with their shippers or patrons." This is a very drastic program. If the party really means it, we fear financial disaster in case of success. But we suspect they do not mean it, for they add that they call for reduction of transportation rates, "care being taken to avoid reduction that would compel a reduction of wages, prevent adequate service, or do injustice to legitimate investments." They marched up the hill and then marched down again.

There is no such excess of radicalism in either the Progressive or the Republican platform. Their test and purpose is to secure prosperity for all, and they seek correction of wrongs thru efficient regulation, by a Federal commission, of interstate corporations. They recognize abuse by monopolies and trusts which must be restrained, but they also recognize that large corporations are necessary. But there must be "publicity, supervision and regulation of the most efficient sort." It is on a strong Federal trade commission that they depend, with full powers to forbid the abuses of which we properly complain. It is a progressive policy, a step in advance, which appears to us safer than the radicalism of the Democratic platform.

On Banking and Currency the most that is said is platitude. All want an improved currency system, and all want it protected against Wall Street, and the Democratic and Progressive platforms are afraid of the Aldrich bill, and the Democrats are as afraid of a central bank as in Jackson's day.

Of course, all the parties have much to say in defense of Labor, but they all say the same thing, ask for the same legislation, except that it did not occur to the authors of the Republican platform to ask for a Secretary of Labor in the Cabinet.

We need not dwell on other points on which there is no practical difference, such as Conservation, Economy, Alaska, Arbitration, etc., and we briefly note some matters which are peculiar to a single platform. The Democratic platform is stiff on State rights, and denies that there is any "twilight zone" between Federal and State control; while the Progressive platform stands for "bringing under effective national jurisdiction those problems which have expanded beyond reach of the individual States." Here the Democratic position is not conservative; it is regressive and absurd. Congress and the courts have left it far behind. The Democrats demand two battleships a year, and with that we disagree. The Democrats also pledge their candidate to a single Presidential term. Therein they condemn Washington, Jefferson, Jackson, Lincoln, Grant and Cleveland. They make experience and success a bar to re-election. The Democratic platform condemns the acquisition of the Philippines, characterizes it as "imperialism"; and it requires us to get out of the islands as soon as we can with a good face. And yet it does not complain of our taking Hawaii or Porto Rico. We regard this position as cowardly and selfish. The Philippine question is about the only one mentioned in the earlier platforms which the Progressive carefully avoids.

There are one or two matters of importance which all three platforms avoid. One is the grant of suffrage to women, and another is the protection of negroes under the rights given by the latest amendments. The civil rights of ten million negroes, and the suffrage rights of fifty million women did not occur to vex the minds of these politicians.

We have thus, as briefly as possible and as fairly as we could, without malice or favor, made the comparison of the principles and pledges of the three chief parties. Let the candid reader judge. To be sure, the profest principles are not all; the personality of the candidates is something; their attitude toward international difficulties that may arise is very important; their experience and also the history of the several parties must be considered. As we have weighed the promises and purposes of these three parties the balance inclines strongly to the Republican party and its candidate, and the trend of feeling is moving more toward him, altho the dead weight of the States which do not allow a free ballot gives a great advantage to the excellent candidate of the Democratic party.

What It Is All About

THE Balkan situation is very easy to grasp as a whole; very difficult to understand in detail. It is impossible to say what is going to happen next; it is quite safe to say what will be the outcome of it all. We can visualize it in personified form at a glance, a scene such as one may come across in a schoolyard at recess; a big boy with his back against the fence and his fists doubled up, four little boys forming a semicircle in front of him bent on revenge, an outer ring of men looking on over their heads, uncertain whether they had better put a stop to it or let them fight it out, hesitating to interfere lest they should get drawn into the fight themselves. It is easy to see by the expression on their faces that the grownup spectators would not mind the big boy getting pummeled a bit; he's obviously a bully, but they will not let things go too far, and if he should get one of the little fellows down they would pull him off. It will not be a fight to a finish.

Now whether there is a war in the Balkans or not, and whichever party beats if there is a war, the ultimate outcome will be much the same. Whatever the event the aim of the war will be in some measure attained, that is, the Christian races of the Ottoman Empire will gain a greater degree of independence of Turkish rule. There is no braver people than the Turks, no better warriors, none more patriotic. Nevertheless they always lose, whether victorious or not. In 1897 Greece made an attack upon Turkey to get Crete and was badly beaten. But Turkey practically lost Crete, and all she got as token of her victory was a thin slice of Thessaly. The Ottoman Empire is essentially nothing but a military despotism of conquered countries, and as such it is an anachronism and must disappear.

The present affair, whatever it may amount to, is merely another step in the continuous process of the disintegration of the Ottoman Empire, going on ever since 1683, when Sobieski checked the advance of the Turk at Vienna. A glance at the following list will show how province after province has fallen away:

THE DISINTEGRATION OF TURKEY.

Greece: Independent kingdom, 1830.
Algeria: French occupation, 1830; now a province of French republic.
Servia: Autonomous principality, 1830; independent principality, 1878; kingdom, 1882.
Roumania: Autonomous principality, 1862; independent principality, 1878; kingdom, 1881.
Montenegro: Independent principality, 1878; kingdom, 1910.
Bosnia and Herzegovina: Occupied by Austria-Hungary, 1878; annexed to Austria-Hungary, 1908.
Bulgaria: Autonomous principality, 1878; independent kingdom, 1908.
Eastern Rumelia: Administrative autonomy, 1878; annexed to Bulgaria, 1885.
Cyprus: Ceded by Turkey to England, 1878.
Tunis: French protectorate, 1881.
Egypt: Occupied by Great Britain, 1882.
Crete: Autonomous, 1898; now striving for annexation to Greece.
Tripoli: Occupied by Italy, 1911.
Albania: Now in rebellion.

There is no reason to think that this process of disintegration is over. Four years ago, when the Young Turks rose and overthrew Abdul Hamid and proclaimed the establishment of a government in which all races and creeds should be equal, it looked for a time as tho a new era had dawned for Turkey, and there was hope for its regeneration. But the Young Turks proved better at promises than performance. The Christians were made eligible to all offices—but were appointed to none. The Albanians were allowed schools—but only Arabic characters were used. Arms were taken away from Bulgars, Serbs and Greeks—and put into the hands of Mohammedans. The Government was no longer under the dictation of a secret circle at court—it was under the dictation of a secret political committee.

At any rate, whether better or worse, the new regime was no stronger than the old. Austria absorbed Bosnia and Herzegovina. The Prince of Bulgaria declared himself a king and Eastern Rumelia as part of his kingdom. Italy seized Tripoli. The Turks were fighting mad about it, but they could not fight. Africa was too far away and they could not get at Italy. For a year now they have had to watch the desperate struggle of their brethren in Tripoli against the invader without being able to lend effective aid. Now that they have a chance at foes

within reach it is no wonder that they jump at the chance. A treaty of peace with Italy has been drawn up, but the Turkish Government dare not sign it and so cede away part of the empire. But if they have another war on their hands or in prospect, they can without disgrace accept the terms of Italy.

Turkey is surrounded by a ring of covetous enemies. When Russia conquered Turkey in 1878, Bulgaria was given territory reaching to the Ægean, but the Congress of Berlin took away two-thirds of it and gave it back to Turkey. This territory or part of it Bulgaria is determined to regain. Servia, which comes next as we go round the ring, would enlarge to the limits of Old Servia, taking in the northern part of Macedonia and the Sanjak of Novibazar. But Novibazar is wanted by Austria-Hungary, for here is her only chance to send a railroad down to the Ægean. Montenegro, a little country with vast ambitions, would like at least to take Albania under her wing. Greece wants all of Thessaly and Epirus, and Mt. Olympus and the Ægean isles.

So that is the situation. The four kings are spoiling for a fight. The Sultan is always ready for one. In the meantime there is The Hague standing by with nothing to do. At the first Hague Conference the Bulgarian representatives complained because they had to take seats behind the Turkish delegation and sign the resolutions as subsidiary to the Sultan. At the second Hague Conference the Bulgarians were delighted to be recognized as an independent Power and to be seated according to their alphabetic rank, well to the front. But has The Hague, in their opinion, no other function than to settle questions of etiquet and precedence?

A Homicidal People

THIS nation of ours is the biggest thing going—in some ways. We hold many records. A new one has just been published. In disregard of human life no other big nation this side of Russia can touch us.

England and Wales are content to get along with a homicide rate of 0.9 per 100,000 of population per annum. We beat that with an excess of 6.22, or a rate of 6.5 for the registration area. Boston, a little bit behind the rest of us, has a rate of only 4.8. Brooklyn, a slow place, has a rate of only 3.6, and Milwaukee hardly worth noticing, a rate of only 2.8. But Manhattan and the Bronx show up very well with a rate of 6.9. Chicago beats us with a rate of 9.1, and San Francisco with a rate of 10.4.

The South, as we cheerfully acknowledge, is the banner section. New Orleans has a rate of 24.1; Atlanta a rate of 29.8; Nashville a rate of 35.3; Savannah a rate of 37.8; Charleston a rate of 32.3, and Memphis a rate of 63.4. Washington, D. C., very properly has a fairly representative rate of 9.2, intermediate between the rates of the Northern and those of the Southern cities. The average rate for thirty cities, North and South, is 8.3.

These are the rates for the year 1911. For the ten-year period, 1901-1910, inclusive, the average rate for the thirty cities was 6.9. The rate for Manhattan and the Bronx was 5.1 and for Memphis 47.1. For the Eastern cities together it was 4.3, for the central cities 7.8, for the Western cities 9.7, and for the Southern cities 14.7. The authority for these figures is the well known insurance actuary and statistician, Mr. E. L. Hoffman, who makes the comment upon them that they are "not compatible with the common assumption that actual progress is being made in the United States in all that is summed up under the term civilization and national welfare."

Mr. Hoffman should remember that there are differing views or conceptions of progress. The people of the United States have been making, we suppose, the most rapid progress on record in the art of treating malefactors with tender consideration. We don't particularly mind the sufferings of murdered people and their relatives, but we resent anything that savors of harshness toward those unfortunate persons whose inheritance and upbringing prompt them to kill. Would Mr. Hoffman have us go back to the days when murderers were hanged? Surely he must know that we are definitely committed to the maxim: "Better that one hundred innocent men and women should be butchered than that one bloody murderer should be put to death."

No, we are really making progress, as

they view it whose sentiments have not been burdened by statistics and executions. Or, perhaps we should say, most of us are making progress. New Jersey, it appears, is almost as backward as England. Newark has the preposterously low homicide rate of 1.7. But New Jersey clings to the old-fashioned notion, just as England does, that murderers should promptly be brought to trial and, when convicted, be made to suffer the extreme penalty of the law. Such backward areas may always be found within civilized territory, but they are mere survivals of the disappearing past. New Jersey will soon feel the pressure of the "great throbbing heart of humanity" that is beating all about her borders, and Mr. Hoffman will be able, when next he casts up his accounts, to show a fairly respectable murder rate to the credit of our sister town across the river.

Incidentally, Mr. Hoffman's figures are conclusive against those impossible persons who want to be nice to murderers, and, at the same time, discourage murder. They have been telling us for many years that capital punishment, instead of checking murder, increases it by brutalizing the community. The facts are now too patent and indisputable to allow any truthful humanitarian to repeat that nonsense unless there is something wrong with his head.

But for those gentle souls who find murder interesting, who like murderers and love to send roses to them; and for those noble minds who associate murder with chivalry and self-respect, the statistics are full of enocuragement. Already the humblest murderer may hope in America to rise to eminence and die, full of honors, of old age. As for those stupid unfortunates who can't live on good terms with murderers, or get out of their way, they must go the way of the unfit. Progress can no longer be held up by them.

Père Lagrange's Submission

Two weeks ago we noted the condemnation by the Congregation of the Index at Rome of all the works of the Dominican, Père Lagrange, the most distinguished of all Catholic Oriental scholars, head of the School of Archeology at Jerusalem and editor of *La Revue Biblique*. His condemnation followed that of Duchesne, the famous French Catholic historian of the early Church. It is the office of the Congregation of the Index not only to examine all books submitted, to prohibit them, and to concede dispensations to those who may be allowed to read in order to refute them, but also officially to investigate whether writings of any kind that should be condemned are being circulated; and to remind the bishops how solemnly they are bound to denounce them to the Holy See. Père Lagrange submits obediently to this interdict of his works from the Vatican. The words in which he yields his liberty are worth reading, as an illustration of the compulsion which it is a shame to put on scholarly freedom. Thus writing from Jerusalem he addresses the Most Holy Father:

"Prostrated at the feet of Your Holiness I come to protest my sorrow that I have grieved You, and my entire obedience. My first purpose has been, and my last will ever be, to submit in spirit and heart without reserve to the orders of the Vicar of Jesus Christ. But precisely because I feel my heart to be that of a most submissive son, I may be allowed to say to a Father, the most august of Fathers, and yet a Father, my grief at some reflections which seemed attached to the reprobation of numbers of my works and which were charged with rationalism. That these works contained some errors, I am ready to recognize, but that they were not written in a spirit of disobedience to the ecclesiastical tradition, and to the decisions of the Pontifical Biblical Commission, allow me, Most Holy Father, to declare, for nothing could have been farther from my thought. I remain on my knees before Your Holiness, and implore Your blessing."

It must have been very humiliating to him thus to prostrate himself, but we observe that he retracts nothing. He admits "some errors," such as may appear in any book not mathematical, and he submits to the condemnation, but nothing more. He is not the kind of man to change his opinions at command, or to save himself the trouble of thinking. Thus he falls short of that full mental subserviency which *The Pilot*, organ of the Cardinal Archbishop of Boston, proclaims in discussing the Biblical Commission:

"The Church welcomes investigation and encourages scholarship, but wisely sets the limits to prevent fruitless work. . . . Catholic scholars may now follow a scientific method without losing time in chasing will-o'-wisps, and the gain in real Scriptural knowledge will

be proportioned to the economy of intellectual force which these decisions have saved for sensible investigators."

"Economy of intellectual force" is admirable.

It is the Old Testament scholars that thus get into trouble on both sides of the Atlantic. A similar victory of conservativism over Modernism appears in the forced resignation of Professor Day in California. After eight years' conflict between the Presbyterian Synod of California and the trustees of the San Francisco Theological Seminary, the synod has won the victory and compelled the resignation of Dr. Thomas F. Day, for eighteen years professor of Hebrew and Old Testament literature, charged with heresy because he believed and taught that the story of Jonah is not historical and for certain other similar lapses from the synod's standard of orthodoxy. He had many defenders in the synod, particularly among the active pastors, but California has a multitude of retired ministers who are not interested in modern studies of the Bible. Twice the synod has asked the trustees to dismiss Professor Day, and twice they have refused, so that the synod planned to elect three trustees in place of three whose term would expire sure to vote against him, and also to stir up a campaign against two or three other professors who were supposed to sympathize with him. Under these circumstances, and desiring to shield them, Professor Day resigns. The charges made against him in the synod a year ago were that he does not believe in miracles; that, in his view, before the coming of Christ there was no knowledge of the coming of such a savior; that passages in the New Testament supposed to teach the fulfilment of Old Testament prophecy are misinterpreted or spurious; that the Levitical law came into existence after the exile; that the Book of Daniel was written long after Daniel's death; that the stories of Jonah, of Daniel in the lions' den, and the three in the fiery furnace, are parables; and that Isaiah's prophecy of the virgin who should conceive and bear a son did not refer to the birth of Christ. Professor Day declared, in reply before the synod, that he fully believed in the miraculous, but that these other questions about the Pentateuch, Isaiah, Jonah, Daniel, etc., are proper subjects for critical inquiry. But there is a school of Protestantism, tho a declining one, which resents any improvements in theology as much as does the Papal Biblical Commission, or as did the enemies of Jonathan Edwards when he inaugurated criticism in this country. Such removals from theological seminaries in the East have been rare of late years, since removals in the Baptist seminaries of Newton and Louisville, the transfer of a Hebraist from Princeton to Canada, the successful Presbyterian attack on Lane Seminary and the unsuccessful one on Union Seminary. The receding wave of fear for the Bible is now at its temporary hight among the invalids who have retired to the Pacific Coast.

Probing the Contributors During the past week the Senatorial Committee has been probing the gifts—not the expenditures—made by wealthy men for the political campaign of 1904, particularly, and, almost exclusively, to the Republican treasury which aided the election of Mr. Roosevelt as President. All that water has past the mill and ground its grist and will grind no more. What we need to know, and what we are being told, is what are the present political contributions and expenditures. We have had Mr. Roosevelt on the stand to tell what he knew about 1904, not that it is of any importance except to show whether he lied when he said that he was ignorant of certain contributions from unpopular corporations or trusts. Among the other witnesses Mr. Morgan was heard, and with the utmost willingness he told that he had in all contributed $150,000 in 1904, $30,000 in 1908, and nothing at all in 1912. He declared that he asked no favors for his gifts and received none. We are so simple that we can believe this quite true. We can believe that he regarded it as very important for the prosperity of the country, in which also his own business interests were involved, that the Republican party should be in control. He could afford to give first $100,000, then $50,000, as well as others of us could afford to give $10, and it was not to his

discredit that he did it. In reference to such a gift there are two questions of importance, one whether he had received, or expected in the future, such special favors from the administraton as should make the money tainted; but there is no evidence of this. The other is as to how the money was expended. We are fortunately getting to be more critical on this subject, and it needs close and constant investigation and punishment of the bribery of voters.

Nicaragua

We give in another column the story of the landing of a small force of marines in Nicaragua to relieve American and European citizens threatened by a rebel force with loss of property and life, and in danger, with the native people, of starvation. This was no political intervention. It was a case in which, at the request of the President of Nicaragua, and acting in behalf of all other nations, the United States did an act of mercy, at the cost of precious life. The saddest part of it all is that this rebellion and this aid by our brave marines would not have been necessary if the Senate had not refused to approve the treaty negotiated with Nicaragua by which we should have done for that little distracted country very much what we are doing with success for Santo Domingo. It was not a kindly refusal. It is our duty to give all possible aid to such distracted Latin republics, and to do so is the best way to keep out of trouble.

On Exclusion of Orientals

We are very sorry to see this letter from Governor Woodrow Wilson to ex-Mayor Phelan, of San Francisco, in support of the exclusion of Chinese and Japanese:

"In the matter of Chinese and Japanese coolie immigration I stand for the national policy of exclusion. The whole question is one of assimilation of diverse races. We cannot make a homogeneous population out of people who do not blend with the Caucasian race. Their lower standards of living as laborers will crowd out the white agriculturists and will in other fields prove a most serious industrial menace. The success of free democratic institutions demands of our people education, intelligence, patriotism, and the State should protect them against unjust and impossible competition. United labor is the basis of contentment. Democracy rests on equality of the citizens. Oriental coolieism will give us another race problem to solve, and surely we have had our lessons."

Senator Gore quotes this as in defense of Mr. Wilson; and in order to injure Mr. Roosevelt he quotes from Roosevelt's Presidential message of December 4, 1906, in which he says:

"I recommend to the Congress that an act be passed specifically providing for the naturalization of Japanese who come here intending to become American citizens."

As we see it Mr. Roosevelt's position is the really democratic and Christian and patriotic one.

That Ulster Covenant

It is Sir Edward Carson and the few hotheads who stir up the Orange rabble in Ulster that are threatening rebellion and treason, but the sober leaders of the Unionist party do not talk in that way, and they must have had influence to tone down the pledge taken at the Ulster demonstrations. The pledge reads as follows:

"We . . . do hereby pledge ourselves in solemn covenant thru this our time of threatened calamity to stand by each other in defending for ourselves and our children our cherished possession of equal citizenship in the United Kingdom, and in using all means which may be found necessary to defeat the present conspiracy to set up a Home Rule Parliament in Ireland. And in the event of such a Parliament being forced upon us, we further solemnly and mutually pledge ourselves to refuse to recognize its authority."

It does not say anything about fighting. Mr. Bonar Law, the Conservative leader, is wholly opposed to Sir Edward Carson's fiery threat to oppose home rule to the uttermost. He said in a speech in Parliament last year:

"If the people of this country decide that they will make the experiment of home rule, then—and here I must certainly part company with some of my honorable friends in this House, and with some of those who supported me in the constituency I represent—I should say I believe in representative government, and, however much I dislike it, you cannot compel the United Kingdom to keep up the present arrangement against their will. And I should say to the loyalists of Ulster, 'You have got to submit.'"

Mr. Bonar Law is a Canadian, and he knows that under home rule Protestants and Catholics can live together in peace; and he knows that a majority of the Ulster men want home rule, and largely because they hate the control of the large landholders, who will not sell, but keep the farmers as renters.

For downright unblushing pride in his shame it would be difficult to match Mr. Flinn's testimony before the Senatorial committee on political contributions. He told with smacking satisfaction how he "gold-bricked" Mr. Quay in a fight for boss-ship, and he reminded Senator Oliver of their shady political deals together, and saw nothing irregular in the big contributions he had made, evidently not so much out of love for Mr. Roosevelt as for his own rule as the big boss of Western Pennsylvania. Flinn did not give $144,308 just because he loved Roosevelt so much, nor because he was such an ardent reformer—we can't believe it; but because he wanted to run the State as Quay had done before him. To the two factions into which the Pennsylvania Republican party is split, one is inclined to say, "A plague on both your houses." But the conduct by the committee of this investigation has thus far been very partial, directed against the Progressive party, when the Democratic and Republican contributions have been equally suspicious. Senator Dixon says that before the convention the Democrats spent five dollars to the Progressives' one, and are now spending ten to one

The lesson of the terrible accident on the New Haven Railroad at Westport is so plain that it will bear no discussion. Indeed, it was not an accident, but the reckless daring of danger by the engineer, who purposely disregarded signals and made the curve at the speed of 50 or 60 miles an hour when the rules required 15. Such wilful hazard of life of innocent passengers entrusted to him deserves severe punishment. It is not a case like that of the aviator, who risks only his own life to show off his hazardous skill to a gaping crowd, and who kills only himself. When the aviator falls we are chary of sympathy, for he risked nobody else; but in this case the engineer killed four outright and maimed twenty others. No apology is possible.

The genesis of the article in this issue on the lynching in West Virginia was in the sending of Mr. Oppenheim by the National Association for the Advancement of Colored People to the scene of the lynching to discover whether it would be wise for that association to give aid to the prosecution of the leader of the mob. An anonymous letter from a colored man in Bluefield had asked for such aid. He did not desire to sign his name for fear the letter would be opened and his life endangered. One of the objects of the association is the investigation of lynchings, of which there have been over 2,500 since 1885. It aims to uplift the colored people by securing them their civil rights, justice in the courts, equality of opportunity, and giving aid to education. Its organ is *The Crisis,* of which magazine Dr. W. E. Burghardt Du Bois is editor.

Were the men who lynched a negro in Wyoming last week among its "best citizens"? They were convicted prisoners at work in the yard of the State penitentiary. The negro had not been tried, altho probably guilty of an atrocious crime, and the convicts thought him unfit to live. That prisoners should be able to overcome the guards within the penitentiary itself, get the keys, unlock the cell and hang the man without interference indicates very lax control.

An address "To the White Voters of the South in Behalf of the Progressive Party" is signed by its leader, John M. Parker, who was the Southern candidate for Vice-President at the Roosevelt convention, and is published in Southern papers. It is all white, negroes not wanted. This is one sentence:

> "Many of us earnestly believe that the only gate for future salvation politically thruout the South is thru the formation of two white parties."

That is the plan which Mr. Roosevelt accepts for the States which disfranchise the negro.

Readers who cut out and preserve the Book Lists as they are published in THE INDEPENDENT will find this accumulative bibliography growing more valuable year by year. Book List No. 27, published in our issue of October 22, 1908, contained references to sixty-five of the most important books on Turkey and her neighbors.

INSURANCE

Agency Cost in Fire Insurance

LAST week's edition of THE INDEPENDENT contains a communication from Mr. Russell M. L. Carson, a local fire insurance agent, of Glens Falls, N. Y., in which he takes issue with some of the views exprest in our article of August 8 last, "The Expense Factor in Fire Insurance." As we observed last week preparatory to presenting the matter in full, Mr. Carson should possess an intimate knowledge of the conditions under discussion, and we are quite sure he has made good use of the materials at hand.

Omitting the largest general and local agencies (the rewards of which are indubitably ample) from consideration here, it is not contended that the average local fire insurance agent receives an annual compensation that could be classed as excessive in comparison with that yielded by other occupations. Regarded from the viewpoint of actual time invested, his returns, on the other hand, cannot be called unsatisfactory; and right there lies one of the troubles constituting this problem: his entire time is not filled up with insurance agency duties. He is generally compelled to combine fire insurance with other branches of insurance, real estate, law, service in a bank and other kindred enterprises. We venture the assertion that there are thousands of cities in the United States of from 5,000 to 10,000 population in which there are from twice as many to ten times as many local agents as could live comfortably at a reasonable rate of commission calculated on the premiums collected. To put the case in another way, it is highly probable that the city of Glens Falls, N. Y., could be as well served by four or five local agents as it is now by the twelve or fourteen engaged in that business, while the cost to the companies (that is to say, the public who buy insurance policies) would be lowered, and the aggregate return to the four or five agents doing the work would be considerably enlarged.

If, as our correspondent seems to believe, the buyers of insurance protection insist on the impracticability of dealing directly with the companies; that it is "impossible for the average business man to give the time necessary to master all the details of the insurance business to such an extent that he could competently place his business with a company many miles away," and for his own convenience he requires the services of a go-between, then he is estopped from complaining about the cost of the service he delegates to another. But he does complain, and his grievance finds utterance through State Insurance Commissioners. Regulation and reduction of commissions by statute, with their implied criticism of company extravagance, have been favorite themes in the official recommendations for several years past.

As we originally observed, the questions of agency and agency commissions are full of difficulties. They may be imposible of solution. Perhaps the agency system offers the only satisfactory medium between the buyer and the seller of insurance protection. Admitting all this, the conclusion is still obvious that there is something defective in a scheme that uses 23 out of every 100 cents furnished by the buyer for the cost of the exchange. It is not necessary to regard such a statement as a criticism of the compensation received by individual agents, nor is it applicable. We are considering conditions as a whole and premiums and commissions in the aggregate.

There is a vast amount of waste material in the agency field; from the underwriters' point of view, much of it is below standard in efficiency; a small fraction, but too large, is both inefficient and immoral; most of it is underpaid, because the pay is divided among a superfluous number of workers; and all of it, as we think we have shown, is more costly to the insuring public than it should be.

Our correspondent describes an office, the work of which is carried on with intelligence, efficiency and a keen desire to render the best service possible to its companies and its customers. It is fairly entitled to such rewards as it receives, but, if the system now prevailing were cured of its defects, the opportunities of the office would broaden, the service would increase in value, and the ratio expense to the public would lessen.

FINANCIAL

Bonds vs. Mortgages

By the big decline in the price of the best bonds which has taken place and the resulting increase in the rate of income obtainable from this class of security, a new turn has been given the discussion as to whether high-grade bonds or real estate mortgages are the more desirable form of investment. As long as the income obtainable from the best mortgages remained considerably above the income obtainable from the best bonds, the superior investment qualities of bonds did not count for so much and the real estate mortgage seemed to have the better of the argument. But now that bonds have declined to a point where they yield very nearly if not quite so much as mortgages, the many advantages which they do undoubtedly possess weigh heavily in the scale and seem to make them the more desirable from an investment standpoint.

Assuming that some given railroad bond and some given real estate mortgage are equally safe and yield exactly the same amount of income, in what respects is the bond the more desirable form of security?

In the first place, because of its greater degree of marketability. A good mortgage can, of course, be converted into cash without the incurring of any very great delay or the making of any great concession in price. But in the case of the bond there need, as a rule, be no delay at all nor any concession in price. During times of panic or even of great financial stress, there are occasions when it is difficult to get a full price for corporation securities of any sort, but at such times the holder of bonds is far better off than the holder of mortgages. At the hight of the panic of 1907 the market for first mortgage railroad bonds was not an attractive one from the seller's standpoint, but there was never a time when the market was not there. That occasion, on the other hand, saw more than one holder of good mortgages hard put to it as to where to raise ready cash.

A second point of advantage in favor of bonds is that, by judicious selection and purchase at a favorable time, money can be so invested as to allow a chance of some appreciation of principal. Nor is it necessary, in order to get the benefit of this chance, that any risk whatever be taken. High grade bonds bought during times when money is scarce and dear, as, for instance, at present, almost invariably rise somewhat in price upon the advent of easier monetary conditions. Mortgages, on the other hand, sell at the same price, whether conditions are good or bad, and allow no opportunity for skilful investment to increase the principal involved.

A further point of advantage in favor of bonds is their distant maturity, and the fact that, the investment once having been made, the investor need not trouble himself every three years or five years about the question of repayment or renewal. A further consideration of importance is that, because of bonds being split up into separate amounts, it is possible to invest any particular sum, and if desired at any time, to liquidate or shift part of the investment. That, of course, in the case of a mortgage, cannot be done.

About the only thing, indeed, that can be claimed in favor of the real estate mortgage as against the corporation bond of equal safety and income yield is that the mortgage does not fluctuate in price. Five thousand dollars put into a good mortgage, due in three years, means that at the end of three years five thousand dollars will be available, whatever the state of the money market or the other markets may be. And that, to a large class of investors, makes a strong appeal.

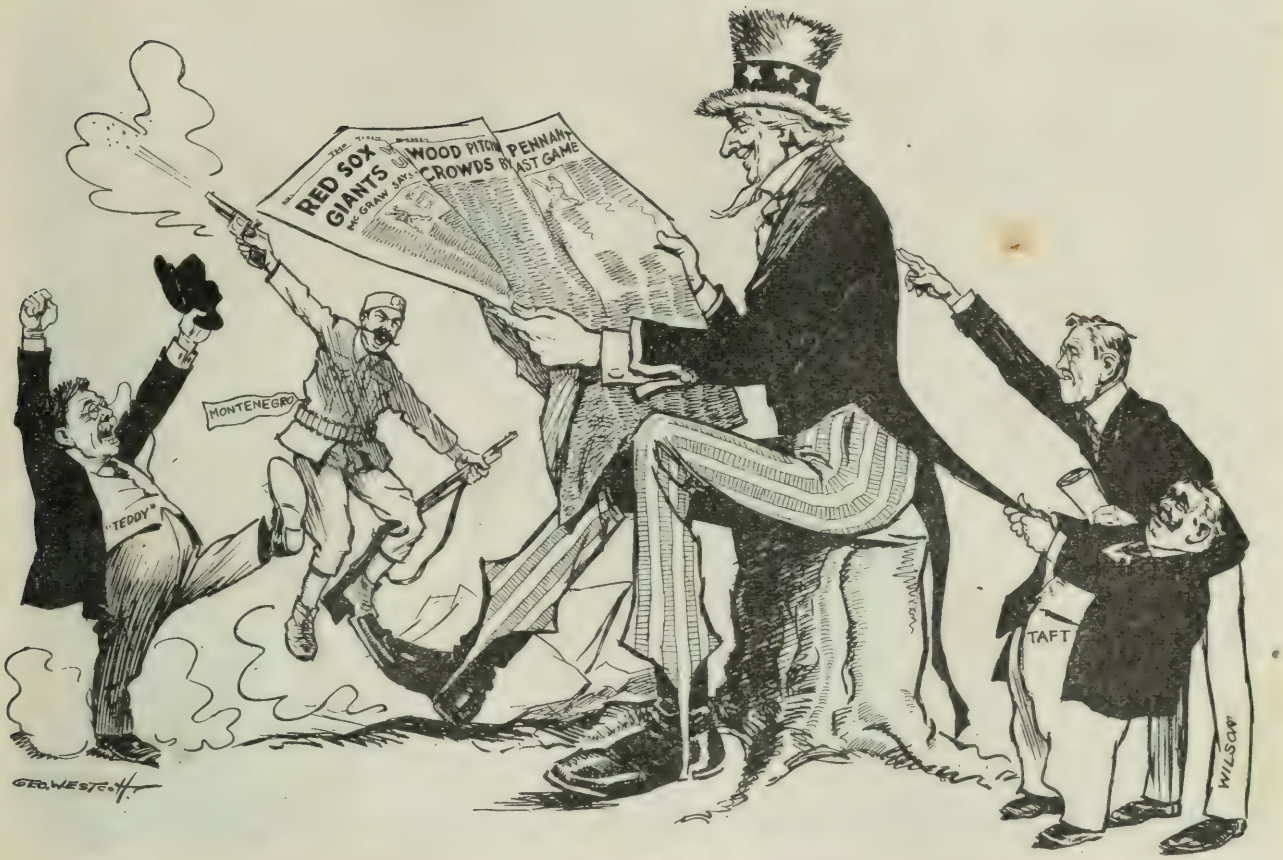
....India's cotton crop is not increasing. The estimate for this year is 3,142,000 bales, which may be compared with 3,833,000 last year, and an average of 4,054,000 in the five years preceding.

....Nelson Olcott, cashier, has been elected a vice-president of the National Bank of Commerce, in New York. The capital of the Bank of Commerce is $25,000,000, the surplus fund and undivided profits $16,157,543, and the total resources $200,365,805.

The Independent

VOL. LXXIII NEW YORK, THURSDAY, OCTOBER 17, 1912 No. 3333

Survey of the World



Pre-Convention Expenditures

The investigation of the Clapp committee of the United States Senate is not completed, and its figures will be considerably increased before the actual sum spent on the primaries and conventions is arrived at. The evidence shows, however, that over $600,000 was raised for Mr. Roosevelt's pre-convention fight and at least $500,000 for Mr. Taft's. On Mr. Roosevelt's campaign $139,867 was spent by William Flinn; and this does not include his contributions to the New York committee. Dan R. Hanna, of Ohio, contributed $127,000 to the same cause, and Ormsby McHarg spent $25,000 in the South. Mr. Hanna is in the coal and iron business, and is an intimate friend of George W. Perkins. His testimony stated that his interest in Mr. Roosevelt's candidacy began in the spring of 1911. It was on April 26, 1911, that he was indicted for illegal rebating at the instance of the Interstate Commerce Commission and the Department of Justice.——The notable feature of the investigation so far as it has concerned Mr. Taft's expense account is the generosity of members of his family. Charles P. Taft, of Cincinnati, told the committee that he contributed this year for preconvention expenses $213,592.41. Some of this money was spent on the Ohio contests. Exclusive of the preconvention campaign of 1908, according to C. P. Taft, he had spent in the President's interests, for political purposes, $372,000. This did not include $150,000 returned at the end of the 1908 campaign from his considerably larger contribution that year. "Personally," said Mr. C. P. Taft, "I believed my brother admirably equipt for the nomination. I believed in his integrity, in his fearlessness, and that no man could bulldoze him. The principal thing to be obviated was any influence that might be aimed against him from a monetary consideration. If elected, I wanted him to walk into the White House free from any embarrassment or obligation. On that basis I was persuaded to go the limit." Other contributors to the President's 1912 pre-convention fund are Henry W. and Horace Taft, other brothers (each gave $50,000); Andrew Carnegie, the Philadelphia banker E. T. Stotesbury and John Hays Hammond, mining engineer (each of these gave $25,000); Ambassador Kerens, Senator Crane, Secretary Knox, etc. Representative W. B. McKinley agreed with Mr. McHarg that the report of the underwriting of the Roosevelt campaign to the extent of two or three million dollars was "absurd."——John D. Archbold, president of the Standard Oil Company, testified before the committee that the Standard Oil contributed $100,000 to Mr. Roosevelt's campaign fund in 1904. This seems to be the contribution which Mr. Roosevelt has admitted he knew had been given, under the name of the late H. H. Rogers, a director of the Standard Oil Company. Mr. Roosevelt has stated that he accepted assurances that Mr. Rogers had large interests outside of the Standard Oil, and that his contribution was essentially personal.—— Mr. Archbold testified that he did not remember the letters published by Mr. Hearst, but that they were no doubt authentic. He denied, however, any infraction of the law, and stated that he never asked any one to break the law or

to secure the enactment of an improper law. Ex-Senator Foraker's payments were, he said, in connection with legal services performed in the so-called Ohio cases.——Ogden Mills, treasurer of the Republican Committee for New York County, testified that wholesale bribery was practised by the Roosevelt leaders in the Eighth Assembly District of New York County last March, and that corruption on a smaller scale had been practised elsewhere. Further he testified that the primary election in general was "the cleanest in the history of the country," partly because there were so many watchers on hand. The Eighth Assembly District is on the lower East Side of New York and was the only district on the East Side carried by Mr. Roosevelt in these primaries.

The Campaign

Altho increased hopefulness on the part of the Republicans was manifested during the last week the betting odds quoted in New York were 4 to 1 on Wilson, and money was offered on the proposition that the Democratic nominee would poll a greater vote than Taft and Roosevelt combined. Mr. Taft returned last week from a motoring tour thru the White Mountains, undertaken for recreation, while Governor Wilson and Mr. Roosevelt continued talking, ending the week with voices much the worse for wear. While the enthusiasm among adherents of the Democratic candidate has been to a great extent partisan rather than personal, a considerable increase in the warmth of his reception has been noted, and, while this might have been explained in St. Louis and Kansas City by the fact that he spoke from the same platform with Champ Clark (as in Lincoln, Neb., he spoke with Mr. Bryan), at Chicago the friendliness of his reception by the great crowds could be ascribed to no coincidence. Governor Wilson has continued to concentrate his fire upon Mr. Roosevelt, alleging in particular that he expresses the point of view of the trusts and emphasizing the fact that the Progressive program of trust regulation has for a principal supporter George W. Perkins. In return Mr. Roosevelt has attacked Governor Wilson as a "tory" and as having failed in his own State to suppress or adequately regulate the many trusts chartered therein. Mr. Roosevelt has also attacked Governor Wilson for alleged inconsistency in his attitude respecting immigration from Southern and Eastern Europe and concerning labor, adding that his thought had advanced since he was a college president, but that he has not yet "entirely reached as advanced a position as I (Mr. Roosevelt) took eleven years ago in my first message to Congress." Mr. Roosevelt was invited to address the Knights of Columbus in Chicago on the 12th, but the invitation was withdrawn, and the same day Governor Wilson became a member of the New York Chapter of the Knights at New York City and made an address on the part played by the various elements in our population, notably by Italians, since the address was made on Columbus Day. Mr. Roosevelt has especially denied Governor Wilson's statements in regard to his trust affiliations. In the course of the week Charles Francis Adams II of Boston advocated in a public letter the election of Mr. Taft, finding Mr. Roosevelt "a man of lawless mind" and regarding Governor Wilson as "an experiment." Another Bostonian, Louis D. Brandeis, told New York social and charitable workers in a meeting at the United Charities Building (where Mr. Roosevelt's editorial offices are) that social reform was to be looked for from the Democratic nominee rather than from the Progressive, in spite of the many excellencies of the platform. Mr. Brandeis regarded the latter as threatening to labor unions and as providing negative rather than positive benefits: prohibiting work for less than a living wage, working under conditions destructive of health, etc. These are measures he regarded as protections for the weak, but he added: "What we long for in this republic, what every American citizen is entitled to, is not the protection of prohibition, but the opportunity of developing. . . . We need the development that comes from self-help, and I find in the program of the new party what would necessarily result in the killing of this possibility. . . . We need now the qualities of the statesman more than those of the agitator or warrior. We need the man who is able to listen with open mind."

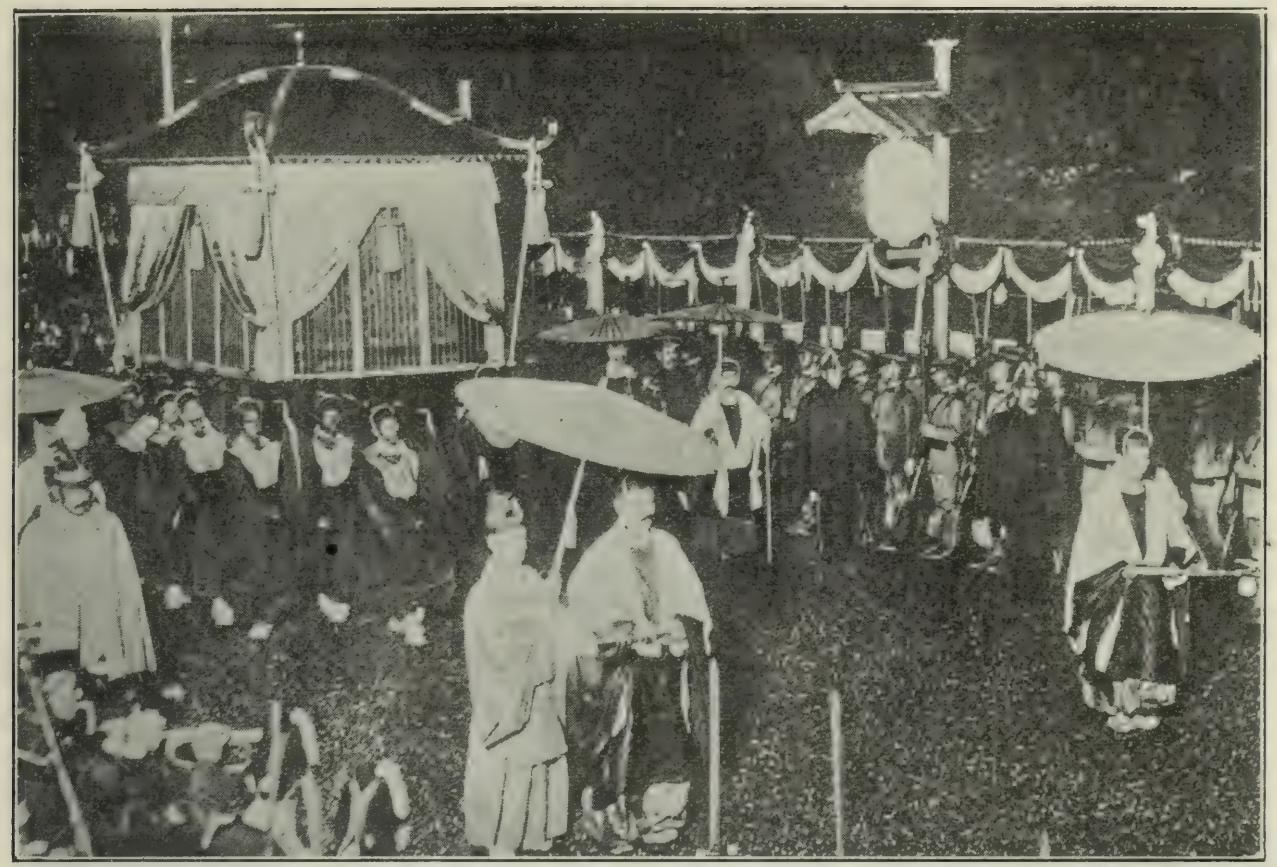
WHAT ARE POLITICS AND WAR TO A WORLD'S SERIES?

Labor

The trial of forty-five men accused of complicity in dynamiting jobs attributed to the International Association of Bridge and Structural Iron Workers is under way at Indianapolis. Ortie E. McManigal, the informer, has pleaded guilty, and has been identified by hotel clerks from various parts of the country as having registered at times when explosions occurred in the vicinity. The movements of J. B. McNamara have been similarly followed. Many telegrams said to have been sent in cipher by members of the Iron Workers' Association have been introduced into the evidence, and one of the forty-five defendants has changed his original plea of "not guilty" to "guilty." According to the prosecution, J. J. McNamara, who is now serving a life sentence at San Quentin Prison, in California, was paid one thousand dollars monthly while active as a dynamiter of non-union bridges and other structures. The Government also claims that a plot to dynamite the locks at Panama was discussed. ——The trial of the Industrial Workers of the World organizers at Salem, Mass., was reopened on the 14th. All but about 500 of the 30,000 textile workers of Lawrence, Mass., had meantime returned to work, those not working being blacklisted, it is said, for intimidation. On Columbus Day, October 12, 30,000 American flags were carried thru three miles of muddy streets by as many men, women and children of Lawrence in a demonstration against the Industrial Workers and their "No God, No Master" slogan. Patriotic songs and "Onward, Christian Soldiers" were sung.

Various Items

The President came to New York on the 14th to review the largest naval demonstration ever seen in the United States: fifteen miles of warships in a double line extending from West Thirtieth street to Spuyten Duyvil Creek. The fleet is commanded by Rear-Admiral Hugo Osterhaus.——The trial of Charles Becker, a lieutenant of police in New York, is in progress. He is charged with ordering the murder of Herman Rosenthal, a public gambler, the alleged motive being fear of Rosenthal's disclosure of a system of blackmailing gamblers and other lawbreakers by unscrupulous police officers. One of the witnesses in the case, a Russian immigrant



C., Brown Bros.

OFFICIALS IN THE FUNERAL PROCESSION OF MUTSUHITO

named Zelig, was shot and killed just before the trial began by a petty gambler and an alleged thief, "Red Phil" Davidson. The murderer states that he had no confederates, but many persons suspect a connection between the removal of this witness and the criminals responsible for the Rosenthal crime. The Rosenthal case, involving as it does the New York police, has led to an investigation by a committee of the Board of Aldermen. This investigation, conducted by Emory R. Buckner as counsel, has revealed infraction of civil service rules by the present Civil Service Commissioner, James Creelman, and also the fact that under Police Commissioner Rhinelander Waldo any man who has not committed a felony is eligible to the force.——According to Secretary Wilson, of the Department of Agriculture, the total value of 1912 farm products will be over $900,000,000, establishing a record.——President Taft has addrest a letter to the Governors of all the States inviting them to confer with him on the occasion of their next annual conference in Washington. The subject which he wishes to discuss with the Governors is a plan for a co-operative credit system to reduce the interest on loans made to American farmers for productive enterprises. In his opinion the systems used in France and Germany are instructive in this connection and the President bases his recommendations on reports submitted by American diplomatic officers who have since March been investigating the question. The President commends the Massachusetts law which allows the incorporation of agricultural credit unions.

Latin America

Colonel Felix Diaz, who recently resigned his commission in the Mexican army, has joined the rebels against the Madero regime. Diaz is a nephew of the former President of Mexico, and the revolutionary factions are said to unite in desiring to instal him as provisional President until another "free election" can be held. He has headed his uncle's partisans since the latter left Mexico to reside in Paris and is said now to be recruiting an army in Oaxaca. ——A revolutionary attempt in Honduras was crushed last week by the ac-

C., Brown Bros.

tion of the Nicaraguan army. A force was organized on the Nicaraguan side of the boundary and was to have been marched across into the neighboring republic. —— American bluejackets and marines in Nicaragua are to be mounted and sent into the interior to patrol districts not accessible by railway. The American force in and about Leon and Chinandhea now numbers over 1,200. Altogether there are over 2,500 Americans under arms in Nicaragua

Preparations for War

The Austrian and Russian envoys delivered, at 11 o'clock in the morning of October 8, a joint note to the Balkan states informing them that the great Powers were prepared to undertake the realization of reforms in the administration of European Turkey and warning them that if war broke out between the Balkan states and the Ottoman Empire no modification of the territorial status quo would be permitted. But Montenegro forestalled this action by a declaration of war two hours and a half earlier. The Ottoman representative at Cetinge was handed his passports and the Montenegrin Chargé d'Affaires at Constantinople asked for his. The declaration of war was issued on the seventy-first birthday of King Nicholas, who, after a public farewell to Queen Milena and his unmarried daughters, amid the ringing of church bells and firing of salutes, rode forth to join his sons at the front. In his proclamation to his people he says:

"Montenegro had hoped to obtain the liberation of the Serbs in Turkey without the shedding of blood, but peaceful endeavors proved unavailing, and no other recourse was left but to take up the sword on their behalf.

"We are assured, in this holy undertaking, of the sympathy of the whole civilized world, and we will have the loyal assistance of the Kings of Servia, Bulgaria, and Greece and their peoples, who in this affair have ranged themselves with the Montenegrins like brothers.

"Montenegro is attacking Turkey not from motives of arrogance, but inspired by a noble resolve to prevent the final extermination of her brethren."

——Part of the Servian troops has been assembled at Nish, and from that point are being dispatched to the Turkish frontier. Another division is to be concentrated on the Bulgarian frontier to co-

operate with the Bulgarian forces, and a third is preparing to invade the Sanjak of Novibazar. The total number is estimated at 220,000.——The Greek army, amounting to 125,000 men, is mobilized and concentrated in Thessaly, on the frontier, under the command of the Crown Prince.——The Turkish Government has seized all the Greek shipping in Turkish ports, stopt the ammunition in transit to Servia, and held the Bulgarian railroad cars, altho these states have not yet formally declared war. The Greeks who are returning home are being forced to pay taxes for the year before they are allowed to leave.——The Turkish army, which has been concentrated at Adrianople to meet the main attack of the Bulgarians, now numbers 450,000 men. A mob of several thousand students armed with revolvers marched to the War Department and the Grand Vizierate, demanding war. The Grand Vizier came out and assured them that he would never grant autonomy to Macedonia, but when he reminded them that the longer war was put off the better for Turkey, they hissed him and smashed the windows. The Sultan has issued the following proclamation to his army and people:

"While the Turkish Government is carrying out reforms and working for the welfare of the people, small neighbors having designs on our country, and realizing that our progress would defeat the attainment of their illegitimate aims, want to prevent the reforms. Taking advantage of our difficulties they have united in an attack on our provinces.

"The Chauvinists of Bulgaria, Montenegro, Servia and Greece, which have been the theater for six hundred years of the exploits of Turkish arms, have sent troops against our frontier, compelling us to mobilize the army for the sacred duty of defending the fatherland.

"It depends upon you to do your duty and not to allow our enemies to tread one inch of the sacred soil soaked with the blood of our ancestors.

"Your enemies are gathering on the frontier seeking to snatch your patrimony from your

NICHOLAS OF MONTENEGRO AND QUEEN HELENA OF ITALY

The King of Montenegro and his daughter are leaving the Cathedral at Cetinge, after the proclamation of the States' elevation from a principality to a kingdom in 1910. In the second row appears the Queen of Montenegro, walking with Victor Emmanuel II, King of Italy, who is all but concealed by the figure of his Queen, in the foreground. Montenegrin troops (on the left) are saluting the royalty.

hands and to destroy the happiness of your sons and your grandsons.

"Fight with the courage of your ancestors."

Montenegro Attacks Turkey

Montenegrin troops began the invasion of Turkish territory last week in two directions, toward the northeast into the Sanjak of Novibazar and toward the southwest into Albania. The latter attack has for its apparent objective Scutari, a fortified town of about 36,000 inhabitants at the southern end of the lake of the same name. Expeditions of Montenegrin troops were sent down both sides of the lake. One party went by boat to Antivari to attack Scutari from the Adriatic side and reached Tarakash, while the main force advanced along the eastern shore of Lake Scutari from Podgoritza, the largest town of Montenegro, tho only having 6,000 population. Here the Montenegrins had assembled on the morning of October 9, under Crown Prince Danilo, when King Nicholas rode out to join him, and, advancing to the front line, was received with cheers and the singing of his own war songs. The honor of firing the first shot was given to Prince Peter, who is serving as captain of artillery. The Turks retired from Mount Planinitza, just across the frontier from Podgoritza, to make a stand at Mount Detchitch. This was captured on the following afternoon, after a hard fight, in which the Montenegrins lost 120 killed and 400 wounded. The Turkish commander surrendered his troops and four guns. The Montenegrins then pushed on to Tusi (Tuji, Tushi), which was surrounded after the capture of its protecting forts. The temper of the Montenegrins is shown by an incident during the bombardment of Mount Detchitch. The King rode up to General Basovich and reproved him for wasting ammunition, whereupon the general saluted his sovereign and immediately committed suicide.——Accounts of the operations in the Sanjak of Novibazar are conflicting. According to the Montenegrin reports General Vukotich captured Byelopolye (Akova) after a hard fight with the Turkish garrison and set

THE SERVIANS IN THE FIELD

THE GREEK ARMY REVIEWED AT 1912 MANEUVERS
The Crown Prince (in the foreground) is General-Commander of the Greek Army

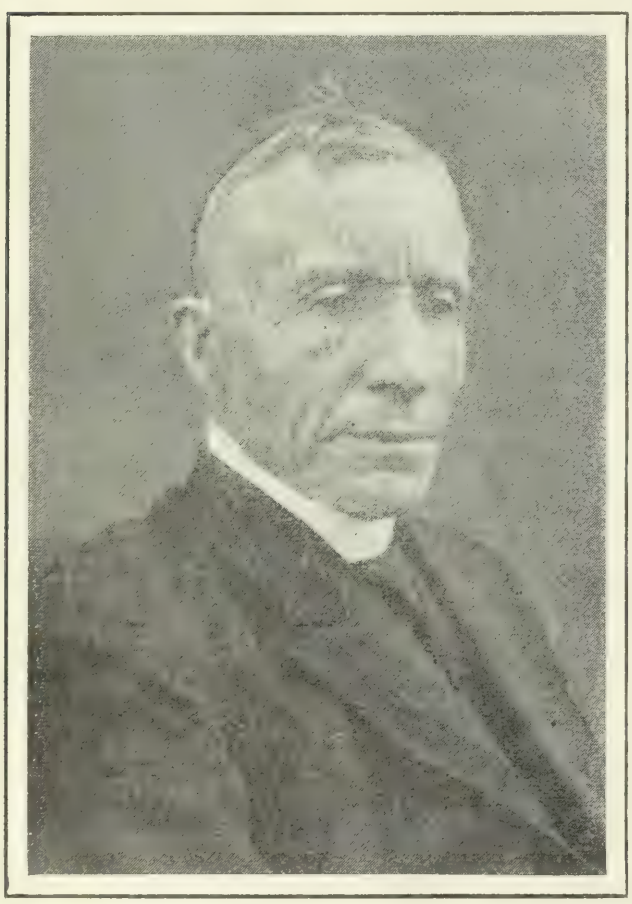
up a provisional government there. The Serb inhabitants welcomed the Montenegrins as liberators and held a church service at which prayers were offered for King Nicholas. Turkish reports, on the contrary, say that Byelopolye was recaptured by the Turks and the Montenegrins driven back to the frontier. They charge the Montenegrins with massacring men, women and children in the surrounding villages of the Sanjak of Novibazar as well as in Northern Albania.——The Servians have also made raids across the border into Novibazar and this invasion of the Sanjak from both sides has aroused Austria, for this narrow strip of territory between Servia and Montenegro is the only point of access which Austria has to the Ottoman Empire, and if it is closed she loses all chance of carrying out her cherished dream of running a railroad thru the Sanjak to Salonika and extending her territory to the Ægean. Austria was permitted by the treaty of Berlin to occupy certain fortified posts in the Sanjak of Novibazar, but after the annexation of Bosnia she withdrew her troops from the coveted district. All Montenegrins in Turkish territory were ordered on October 12 to leave within twenty-four hours. The Malissoris of Albania are divided in their sympathies; the Christian tribesmen are aiding the Montenegrins, while the Moslem have joined the Turks, with whom they have just been fighting.

Diplomatic Maneuvers

On October 12 Italy issued a demand that the Ottoman Government consent within three days to conclude peace upon the terms discussed and said to have been agreed upon at the informal conferences held in Switzerland. In case Turkey does not comply Italy threatens to dispatch her fleet to strike a blow at a more vital part of the Ottoman Empire than has yet been reached. In preparation for the blow the Italian fleet has been collected in the Ægean Sea, tho whether the blow will be struck at Salonika or at Constantinople remains to be seen. The Italian Government has expended on the war up to October 12 about a hundred million dollars. The average annual surplus is about $13,000,000, so that an increase of taxation will be necessary.——The exchange of views among the Powers on the Balkan question instigated by the Austrian Foreign Minister, Count Berchtold, some weeks ago, resulted finally and perhaps too late in the following collective note delivered to the Ottoman Government on October 10:

"The undersigned Ambassadors of Austria-Hungary, Great Britain, France, Russia and

THE BULGARIAN ARMY MANEUVERS



Germany have been instructed by their respective governments to inform the Sublime Porte that the five Powers take note of the intention of Turkey, publicly announced, to introduce reforms and they will immediately discuss with the Porte, in the spirit of Article XXIII, of the treaty of Berlin and the law of 1880, the reforms required in the administration of European Turkey and the measures capable of assuring their realization in the interest of the populations, it being understood that the reforms will not affect the territorial integrity of the Ottoman empire."

Article XXIII of the Treaty of Berlin referred to was quoted in last week's INDEPENDENT. It authorizes the Powers to take under their joint protection other parts of Turkey (meaning Macedonia) in the same way as they have Crete, but they have never taken advantage of the privileges conferred upon them by this clause.——On Sunday night the Bulgarian Government presented notes to the Austrian and Russian envoys at Sofia in reply to the collective note of the Powers. Its tenor is in effect that the three Governments (Bulgaria, Servia and Greece; Montenegro having by engaging in hostilities passed beyond the diplomatic stage) express their gratitude at the interest shown by the great Powers in the condition of the population of European Turkey, but adds that after so many promises made by Turkey and recorded in international documents, it would be cruel to these populations not to endeavor to obtain more radical and definite reforms in order to ameliorate their condition. The three states, therefore, have addrest themselves directly to Turkey, indicating the general nature of these reforms and the necessary guarantees for their application. Should the Turkish Government act as proposed, order and tranquillity will be established in the Ottoman dominions and durable peace will be assured between Turkey and the Balkan states, toward which Turkey has too often assumed an arbitrary and provocative attitude. The note to Turkey referred to above was delivered simultaneously with that to Austria and Russia, and is reported to include demands for the immediate demobilization of the Turkish army and a promise to carry out within six months certain specific reforms, among which are: The administrative autonomy of the provinces under the control of the great Powers and the four interested Balkan states; the appointment of Christian governors; elective provincial assemblies; free education, and proportional representation of the various nationalities in the parliament at Constantinople. This note is scarcely to be regarded as an ultimatum, as it specifies no time for an answer and makes no threats, but the effect is much the same, for the Ottoman Government could hardly, under the circumstances, accept the terms dictated.

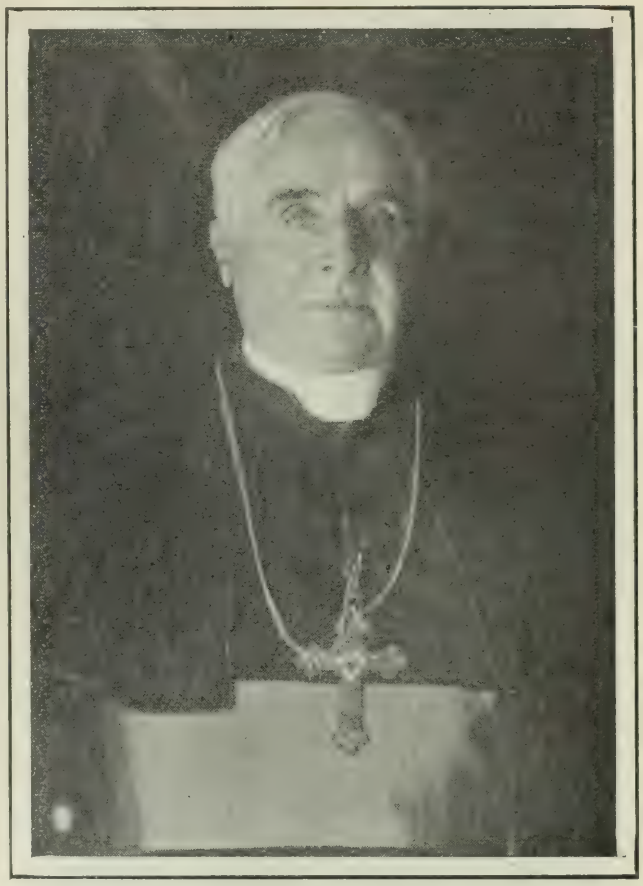
The Three American Cardinals

BY RICHARD SHEIL

FOR a quarter of a century Cardinal Gibbons has worn the Red Hat. Strangely enough, he got it largely by chance. When, in 1884, the Third Plenary Council of Baltimore was convened, Cardinal McCloskey, of New York, was living. As member of the Sacred College and hence papal legate *a latere,* he should have presided. As his health was poor, he waived this privilege and suggested Archbishop Gibbons, of Baltimore, instead of his own coadjutor and future successor, Corrigan, whom the invalid cordially disliked. Here, then, came the first great opportunity for Gibbons. The council lasted about a month and was stormy. Its inner history has not as yet been written. It ended satisfactorily to Rome, who found that its *schema,* prepared and forwarded beforehand, had been rather closely carried out. As a consequence, the Primate of Baltimore received in 1887 the Red Hat in succession to McCloskey, but only after it had first been offered to Williams, of Boston, who refused it. The rivalry, started over the charge of the council and fostered by the entrance of Gibbons into the Sacred College, was brought to a head in the question of the Catholic University. To Cardinal Gibbons the public at large accord the credit of its establishment. He, however, deserves it but little. Bishop Spalding was its father, Mary Caldwell its mother, and Archbishop Ireland its sponsor. Before the bitter controversy, stirred up by the American reactionaries, the Jesuits and the friarhoods, the timid Gibbons weakened and threw up the effort. Ireland was of sterner stuff. He determined never to leave Rome, where he was laboring for the venture, a loser. He not only won, but had the joy of seeing his friend, Bishop J. J. Keane, of Richmond, appointed the first rector.

CARDINAL JAMES GIBBONS
Archbishop of Baltimore

Gibbons, however, secured Washington in his own diocese as the seat of the new school. The Madames of the Sacred Heart, no doubt under the influence of Corrigan, had offered to Bishop Spalding, whose sister was one of the order, part of their property in Manhattanville as a site for the proposed university. Corrigan, Spalding and New York were left aside. The result was a fresh alignment of the American bishops, the liberals and the "mossbacks." The latter were endorsed by the German *Centrum,* and Cahenslyism tormented the American Church for a decade or so of years. On this question of national churches Cardinal Gibbons avoided many pitfalls by taking the stand that the movement would die out. In the long run, he held, the children of Germans would prefer English and would attend English schools and churches. The national movement, now defunct or dormant among Germans, is strong with the Poles, Bohemians and Lithuanians. These last, by the way, have married clergy. In his own diocese Gibbons has national churches, of which seven German are in Baltimore alone.



In another contemporary question Gibbons won, but showed his now well-recognized timidity. His first act as Cardinal was his defense of the Knights

of Labor, who had been condemned by the Canadian hierarchy. Taschereau, of Quebec, and Gibbons, of Baltimore, traveled together to Rome, there to receive the Red Hat and to take opposite sides on the question of the Knights of Labor. Prelates who were then in Rome have assured me that it was all they could do to keep Gibbons up to the scratch. The latter's main argument was, it was useless and needless to condemn that organization, as it would surely fall of its own weight. Leave them alone, he advised. This Leo XIII did. The Cardinal's prophecy proved correct.

At the opening of the Chicago Fair in 1893, Cardinal Gibbons turned a neat trick on the Methodist bishop, Fowler, I believe, who offered the opening prayer. The Baltimore prelate not only imparted the benediction, which was his assigned part, but also delivered a well prepared speech, which he should not have done. In this he was encouraged by the presence of the Papal Delegate to the Fair, Satolli, who had come ostensibly for that purpose, but mainly to impose a set of rules to cover the school question. These he had laid down to the assembly of archbishops at the See House of New York in the shape of fourteen propositions, which thenceforward became the *norma* for Catholic schools. Then Rome showed its true self. It availed nothing that the archbishops, setting aside all other differences, voted unanimously against the new regulations. Gibbons was thus ignored and superseded.

A new question followed, the creation of a Delegate Apostolic in Washington. In its favor were the men whom the Delegation has since hit the hardest. This step seemed a blow at Cardinal Gibbons, who never openly opposed it, altho probably foreseeing the entrance of the never withdrawn Curial wedge. The object of the liberals in securing the legation was to hold a weapon over the reactionaries. It is related that a Catholic politician of high name once said to Cardinal Gibbons: "Why does not Rome send us a man whom we may bring out?" "We American bishops do not want such a man." It was bad enough to have the higher office.

At the start all went well. Satolli, the first Delegate, traveled around the country telling Catholics that they should have the Bible in one hand and the Constitution or American flag in the other. When nominated Cardinal, the Roman prelate stood forth in his true colors. In two speeches—one at the dedication of a German church, Pottsville, Pa., and the other at the Jesuit Seminary, Woodstock, Md.—Satolli threw overboard the American liberals. His addresses had been published and the first edition exhausted. For the second edition Satolli had sent the two new addresses. But when the volume appeared these speeches were not in it. Schroeder, of the Catholic University, called the editor's attention to the omissions. The latter and his coworkers remembered distinctly that they had had one address in galley proof and the other in both galley and page proofs. Satolli was indignant. He charged his own secretary, Rooker, who afterward died a bishop in the Philippines, with having destroyed the addresses, while he exonerated the editor. Rooker and the editor took up the matter and traced the destruction of the two addresses to the printer's office.

CARDINAL JOHN MURPHY FARLEY
Archbishop of New York

CARDINAL WILLIAM HENRY O'CONNELL
Archbishop of Boston

Then the matter was dropped. The suppression was a thin attempt to hide Satolli's turnover. It is enough to add that Cardinal Gibbons had asked the editor to give the book to that Baltimore press.

On his return to Rome, Cardinal Satolli charged Bishop Keane, the rector of the university at Washington, of being a Pelagian, that is, one who believes a man's first efforts must come from himself, while grace steps in and cooperates thereafter. The wily Italian cloaked his schemes under the zeal of religion. Leo XIII demanded of Gibbons the removal of Keane. Had Manning of London or even Richard of Paris been in Baltimore, the order would have gone into the waste paper basket. When Rome ordered Manning to restore Mgr. Capel, whom the former had suspended from all clerical functions, the English Cardinal told the Vatican that it would have to send another archbishop to Westminster. Gibbons yielded. He was content to sign a letter written in French and directed to Rampolla, which was as strong and terse a document as Rome received in many a day. Its writer was Dr. Magnien, of St. Mary's Seminary, but we doubt if the Cardinal saw the drift of its contents. The letter was a balm to himself and left Keane a Canon Sub-Deacon of St. John Lateran, Rome.

Keane made no resistance. The blow struck him as a bolt from the blue. Not so the next victim, Mgr. D. J. O'Connell, rector of the American College, Rome. He fought and fought hard, staving off his removal till Cardinal Gibbons arrived in Rome in June, 1895. Once more Gibbons left the friend who had worked harder and done more for him than any one in the world, save perhaps his parents. O'Connell had to resign, but only to open "Liberty Hall," which became the rallying point of Catholic liberalism and scholarship.

In 1898, during the discussions which preceded the Spanish-American War, Archbishop Ireland was in Washington at the Pope's command in an effort to avert it. He failed. At the most critical point in the proceedings, when Cardinal Gibbons's help seemed useful, if not necessary, His Eminence slipped off to New Orleans to visit his family, and left Ireland to be blamed, notably by the Jesuits, as the cause of the war. Later on this resulted in the Taft Commission to Rome in order to settle the question of the Friars' Land. Ireland had to bear the brunt single-handed against Corrigan of New York, who fought it inch by inch. Cardinal Gibbons would not commit himself.

As the pioneer Bishop of North Carolina, 1868 to 1872, when the Catholics numbered less than 3,000; later on, 1872 to 1877, as Bishop of Richmond, Va., with a Catholic population of 14,000 in a population far in excess of 1,500,000, Bishop Gibbons learned to rough it. He had to use his saddlebags as a sacristy, and was forced at times to curtail liturgical ceremonies in a way which would have shocked Rome.

Thus he had a severe apprenticeship, which, in his case, while ruining his health, rather mellowed his character and in no small measure won him to the simple life. He is a great sufferer and yet gentle in his ways; simple enough to be content with a working room and a

bedroom in the Cathedral parsonage; quite unlike his two brother Cardinals, who live in luxury.

The next Cardinal—Farley, of New York—has had pretty smooth sailing. A Roman student, then a working priest of New York, afterward secretary to Cardinal McCloskey, later on pastor of St. Gabriel's Church in the old twenty-first ward. This parish was formed by Dr. Clowry, who also founded its parochial schools; altho nowadays the present Cardinal gets the credit. When Archbishop Corrigan applied to Rome, Farley was not his choice. His name was on the *Terna*. In all decency, Corrigan had to insert Farley's name, as he had been McCloskey's secretary and was a vicar-general of the diocese; the more so, as he had named the other vicar-general, Mgr. Mooney, who, the report goes, was the Archbishop's choice. Farley was named. Corrigan died rather suddenly, and the pallium fell to Farley, who owed his elevation chiefly to the unanimity of the clergy of the diocese, supported by the archbishops of the country. Farley's appearance in the limelight was not very masterful. Farley hardly sizes up to the importance of his see.

His first prominent appearance as Archbishop of New York was at the mass meeting held in the Hippodrome to protest against separation in France. No doubt Rome ordered this and similar meetings thruout the world, and Farley obeyed orders. But his speech was not merely a round of abuse of the Eldest Daughter of the Church, but proof positive that he knew practically nothing about the real trouble and its causes between France and the Vatican. Since then we heard little of him till he refused to Comptroller Prendergast all information as to the manner in which Catholic institutions expend the grants received by them from the city of New York. Within the fold, Farley gave great offense by removing Dr. Driscoll, a scholar and a gentleman, from the presidency of the Diocesan Seminary, Dunwoodie. This Farley did by letter from Rome.

Since the days of Archbishop Hughes, who was a great public character, the two men who have held the See of New York, McCloskey and Corrigan, have allowed themselves in great measure to be sidetracked. It was the Episcopalian Bishop, Potter, who was to the front in civic gatherings. Cardinal McCloskey, altho a master of English and one of the finest elocutionists I ever heard, cared not to push himself forward. On his part, Archbishop Corrigan had his hands full with Church squabbles at home and abroad. Farley, however, seems to revert to the Hughes type. The latter stood upon his own feet; the former seems rather the apex of a pyramid made up of Jesuits, Knights of Columbus, Federation of Catholic Societies and the New York Catholic Club. The last named had once upon a time blackballed politicians. But since the advent of Farley, the Catholic Club has become the Wigwam of South Central Park. We wonder if the politicians will work Farley or will he manage them. He will make no very striking mark in the history of Catholicism in the United States. In the story of the canonization of saints he will go down to posterity as the man who bought and presented to the reigning Pontiff the birthplace of Saint Pius IX. In the archives of New York he will be recorded as the Catholic Archbishop who cried out to the city's representative, the Catholic Comptroller, Prendergast, "Hands off!"

On passing to the third Cardinal, William O'Connell, of Boston, we meet a different man. While he was rector of the American College in Rome, the successor of his namesake, D. J. O'Connell, Cardinal Gibbons never stayed at that college, his rightful abode, where is a splendid suite of rooms. O'Connell, of Boston, however, may thank the Cardinal of Baltimore for his own entrance into Rome. For Gibbons's weakness in not upholding the other O'Connell was the occasion why the rectorship of the American College was vacant. Both Gibbons and Williams, who suggested William O'Connell for the honor, lived to regret bitterly the day. As Rector of the American College in Rome, William O'Connell enlarged its buildings. He got and took exclusive credit therefor, altho to make the purchase he had at his command a large sum—some say $45,000—gathered by his predecessor and handed over to him. In Rome the new Rector blossomed, flourished, fruited. Always a Curialist, he was also during the Span-

ish-American War an out and out pro-Spaniard. He was soon made Bishop of Portland. His dear friend Satolli, managed the affair. When the venerable Archbishop Williams, of Boston, asked Rome for a coadjutor, the name of William O'Connell was not put upon any *Terna, i. e.,* the canonical list of three candidates. Neither the clergy, nor the bishops of the province, nor, in this case, the Archbishops of the United States, listed him. William O'Connell, then Bishop of Portland, Me., went to Rome ostensibly to take part in the celebration of the Golden Jubilee of the Dogma of the Immaculate Conception, December 8, 1904, and remained there till the following April. Once again Satolli took hold of the nonlisted and discarded aspirant, who left the Eternal City only after he had secured the coveted prize. It was a long fight. The choice of Williams was Harkins, Bishop of Providence. Ranged with the old Archbishop was Cardinal Gotti, Prefect of the Propaganda, who, as luck would have it, fell seriously ill, and thus left the opening to Satolli's protégé. Within the inner circles the story went the rounds that a well-known priest of Boston left that city the day on which the cable announced the nomination of William O'Connell. En route to Washington, he stopped off at Baltimore and told about the cablegram to Cardinal Gibbons, who answered that he did not believe it, as Rome would never inflict that indignity on the American hierarchy. The "indignity" was canonically installed. In Holy Cross Cathedral, Boston, in the presence of an enormous congregation, the Bull was read, the new coadjutor delivered an address and the clergy responded. Thruout the whole ceremony Archbishop Williams sat like a statue upon his throne. When the addresses were over, he stood up and without uttering even a syllable passed out of the sanctuary. Thus he showed his disapproval, affronting, in the most public way, Rome's choice. It may, however, have proven some comfort to the wounded heart of the old Archbishop that Pius X sent him, thru one of his own clergy, the message: "Tell your Archbishop that I am very sorry that he did not get the man he wanted"—Bishop Harkins.

The most notable event in O'Connell's life while Bishop of Portland was his mission as special Delegate Apostolic to Japan. Up to the present the reasons for that appointment have not leaked out. A missionary of the Society for Foreign Missions of Paris, who had spent twenty years in the Mikado's kingdom, declared that O'Connell's visit in all the millinery, pomp and circumstance of a Papal Delegate was disastrous to all missionary efforts. Heretofore the Japanese had seen only the missionary, hard working and poor. Now Dives in purple and fine garments feasted before them, who were, in consequence, disillusioned of their Lazaritic imaginings. When referring to his Japanese mission, Cardinal O'Connell never forgets to declare: "Your Archbishop was the second Delegate to Japan; St. Francis Xavier was the first."

As Archbishop, O'Connell has wrought two very much needed reforms: he divided the large parishes and abolished the custom of giving the Easter and Christmas collections—the largest of the year—to the clergy, chiefly the pastor. In earlier days this extraordinary help was needed, and Archbishop Williams had grown up with the custom. This important step brought home to the clergy that they had a master. Very likely, O'Connell handles his clergy at their own standards, for as they are in the main Irish, the clan idea dominates them. In fact, O'Connell's iron hand in Boston seems but a repetition of Parnell's over the Irish party; John Kelly or Croker over Tammany Hall, and "Boss" McLoughlin in Brooklyn. Luckily, too, for O'Connell the French-Canadian element—more than a million in numbers—mostly dwell in the other dioceses of New England.

To control his people the better O'Connell bought *The Pilot*—the old Irish Catholic weekly—of Boston. To maintain its circulation he levies a subscription list on the various parishes *pro rata,* according to the size of the congregations, their wealth or both. The parish priests are held responsible. In fact, *The Pilot* is the parish tax. Fulsome is its praise of its owner, who maintains it at his ease and without expense.

Of his addresses the first notable one was delivered in Boston while he was still bishop of Portland. It was on the Latin and Teutonic races. His thesis

was that the former had all the poetry, chivalry, courtesy, religiousness, while the latter were gross, materialistic, plodding, without much religious or artistic sense. And yet the same Cardinal is very fond of hobnobbing about Back Bay, where dwell the offspring of these northern peoples. As Archbishop of Boston he spoke at a meeting, held under the auspices of the Federation of Catholic Societies, in which he reviewed Colonel Roosevelt's tiff with the Vatican on his return from Africa. O'Connell called the well-known journalist, John Callan O'Loughlin, who was the intermediary, a "Judas." He then and there put the ban on the writer by declaring no Catholic should ever vote for him or his likes, if a candidate for office.

As Cardinal he laid down the law that he is a prince of the church, ranking next to royalty. To honor this princelet, the committee in charge of his reception desired that the Ninth Regiment —the Irish Catholic—should appear in the parade. Governor Foss had nothing to say against those militiamen taking part; but he refused to allow the uniforms and muskets of the State to appear. At a dinner following soon after, orders came from the See-House, that the new Cardinal should have the place of honor next to President Taft, who presided. Governor Foss refused to be present. The ruler of the Bay State would yield his place to no one but the President of the country.

Taking the three Cardinals together, it must be admitted that the word "scholarly" fits none of them. Not one of them has taken up the great questions of scholarship, higher criticism, modern ethics, history, modern psychology, and many more subjects to which are devoted thoughtful men the world over. Probably the Cardinals feel no need of advanced study. The Sacred College is a political body. As a student of St. Mary's Seminary, Baltimore, Gibbons, so an old professor of his assured us, was devoted to reading the English Catholic Bible; and as a seminarian he had to steal in *Brownson's Review*, which the Sulpitian faculty had forbidden. Of his writings, the little book "The Faith of Our Fathers" describes an idyllic Church; and because of its putting aside all rancor and controversy it has been one of the chief causes of Cardinal Gibbons's popularity among Protestants. In the first edition there was no chapter on the Virgin Mary. His other works, "Our Christian Heritage" and "The Ambassador of Christ," are largely compilations. In the former he went to sea when handling some scientific questions. Another point in Gibbons's favor is his happy knack of giving out popular views on various public questions in rather a plain, homely fashion.

Farley is rather unknown. On no great public questions has he shown much aptitude, but some idea of his literary baldness as well as of his narrowness of view may be formed from the following speech delivered at the close of the last commencement of St. Francis Xavier's College, one of the Jesuit schools of New York:

"We always look upon commencement as the harvest of occasions to the holy priesthood. I hope that St. Francis Xavier will show in the fifty years to come what she has shown tonight, that she is up to date. Let me tell you that the leading men in this city who are maintaining law and order are graduates of this college. I congratulate your parents for choosing a Catholic college for the education of your children."

Finally O'Connell is the true demagog, masterful and unscrupulous. He is a musician, but thus far has produced nothing but speeches and pastorals.

The three men seem to illustrate phases of Catholicism. Gibbons, in his personal appearance of a delicate man and from his unceasing preaching of morals and ethics, may be said to typify the ascetic side. Farley, as priest, bishop, archbishop and cardinal, may stand for the ordinary Catholic of every day life. O'Connell is the Curia itself transplanted under the shadow of Harvard. Curial by training, he is curial in ruling. *"Aut Cæsar aut nullus,"* seems his watchword, as it was Cardinal Manning's. In the long run, Rome will regret his Red Hat. It cannot take it back, but one need never be surprised if the Cardinal of Boston is transferred to Rome. Some twenty odd years ago, the liberals among American churchmen talked of having a cardinal *in curia*, who would look after the interests of the American Church. O'Connell of Boston may yet fill the bill.

New York City.

What If No President Is Elected?

BY ALBERT E. PILLSBURY

Ex-Attorney General of Massachusetts.

AFTER the makeshift Electoral Commission of 1877 had cast the disputed Presidency in favor of Hayes, an eminent scholar and publicist, referring to the fact that the Constitution makes no provision in certain contingencies for succession to the Presidency, said: "The methods of the Presidential election and succession are now the only points in the Constitution which can seriously threaten the perpetuity of the Union; in them, if anywhere, lie concealed the germs of disintegration and destruction."

Events are impending which may again put a serious strain upon this historical weakest point in our frame of government. Various writers in the public press have called attention to the position of the political parties in the two houses of Congress, especially in the House of Representatives, in view of the fact that if neither of the three Presidential candidates secures a majority of all the electoral votes, the election of a President will devolve upon the House, and of a Vice-President upon the Senate. But none of them, so far as I have observed, has traced or perceived all the consequences which may follow from the present situation, without precedent in our political history, nor disclosed the most dramatic and disturbing of its features. There can be no question but that it contains the seeds of possible mischief, and it ought to be fully understood, especially by Congress, which alone has power to deal with it, while actual danger is yet afar off.

By the Electoral Count Act of February 3, 1887, 24 Statutes at Large 373, the electors are required to cast their votes on the second Monday of January following the election, and the two Houses of Congress are required to meet and count the electoral votes on the second Wednesday in February thereafter. If it appears that neither candidate for President has received a majority of all the electoral votes, Amendment XII of the Constitution, which arose out of the Jefferson-Burr episode of 1801 and was substituted for the original electoral scheme of Article II, Section 1, requires the House of Representatives to "choose immediately, by ballot, a President." If the same failure of choice of Vice-President by the electors appears, the amendment prescribes that "the Senate shall choose the Vice-President," tho without the injunction that it shall be done "immediately." The person so chosen by the House, if any, is President of the United States as completely as tho chosen by the electors. In default of an election of President, the person chosen Vice-President by the Senate, if any, "shall act as President," as in the case of any vacancy otherwise occurring.

It is now familiar that in electing a President the House of Representatives votes by States, each State delegation having one vote, the choice being restricted to the three candidates having the highest number of electoral votes, and a majority of all the States being necessary to a choice. Different and conflicting statements have been made of the party alignment of both the House and the Senate. In what is perhaps the most elaborate discussion of the subject, by the editor of the *North American Review* in the September number, it is assumed that the delegations of Maine, Nebraska, New Mexico and Rhode Island are evenly divided between Republicans and Democrats, so that they might be unable to vote, and that of the remaining forty-four States, twenty-two delegations are Republican and twenty-two are Democratic. According to late information, which ought to be authoritative, this classification is correct. It is, therefore, quite within the range of possibility, however unlikely it may be to occur, that neither candidate will be able to secure the votes of the necessary twenty-five States, and that the House of Representatives will fail to make choice of a President if that duty devolves upon it.

If neither Presidential candidate secures a majority of the electoral votes, it is probable that each candidate for the Vice-Presidency also will be left without a majority, whereupon the Senate is to elect a Vice-President. But here the Senators vote by the head, their choice being restricted to the two candidates having the highest number of electoral votes. The votes of forty-nine Senators, being a majority of the whole Senate, are necessary to a choice. The political classification of the Senate is sufficiently uncertain to make the result in that body at least a subject of interesting speculation. It is understood that there are nominally fifty Republicans and forty-four Democrats, with two present vacancies, in Illinois and Colorado respectively, which may be filled early in the ensuing year by the incoming Legislatures of these States. The group of so-called insurgent Senators, who may or may not act with those of the "old guard," is reckoned to embrace Senators Borah, Bourne, Clapp, Dixon, Poindexter and Works. It is yet too early to know certainly whether both of the two Senators to be elected will be Republicans, or whether one or both will fall into the insurgent group. It is, therefore, not certain that the Senate can make, at least without some difficulty, a choice of Vice-President, especially in the unlikely but not impossible event that the choice may have to be made, by the votes of Republican Senators, between Marshall and Johnson.

At this point appears the most remarkable feature of the situation. In the public discussion of this subject it seems, so far as I have observed, to be universally assumed that in event of the failure of the House to elect a President and of the Senate to elect a Vice-President, the Presidential Succession Act of January 19, 1886, 24 Statutes at Large 1, comes into operation, and that the Secretary of State, or if there be none, the Secretary of War, and so down thru the first seven cabinet officers in the order of their historical creation, would succeed as acting President to the powers of that office. This is a mistaken assumption. This act provides for the succession to the powers of the Presidency only "in case of removal, death, resignation, or inability of both the President and Vice-President." The event which we are contemplating is neither removal, death, resignation nor inability, but a vacancy by failure to elect. The term of office of the President and Vice-President is limited by the Constitution to four years, and runs from the fourth day of March, in virtue of the fact that the Congress of the old Confederacy fixed that day for the first inauguration of President Washington, whereupon it was adopted into the law of 1792, which is still in force (Revised Statutes U. S., Section 152), as the beginning of the term. It follows from the statutory beginning of the term at the fourth day of March, and the Constitutional limitation of it to four years, that neither President nor Vice-President can hold over or exercise any of the powers of his office after that day.

Accordingly, the actual situation is that in default of a choice of President at the polls and of an election of President by the House or of Vice-President by the Senate, each office will become vacant on the fourth day of March, and no clause of the Constitution nor any existing Federal statute provides for the filling of either office. The executive power of the United States, except such minor parts of it as particular statutes have conferred upon the heads of departments or other administrative officers, is suspended and adrift, without any law providing for its exercise or for the choice of a person to exercise it

The Succession Act of 1886 repealed the clauses of the act of 1792, which provided for the calling of a new election in such an event (Revised Statutes U. S., Sections 147-150), prescribing that the Cabinet officer succeeding to the powers of the Presidency, if Congress is not then in session, shall summon it to meet on twenty days' notice, leaving the situation to be dealt with by that body as best it may within such constitutional powers as it may have for the purpose. But as this act does not come into operation upon a vacancy by failure of election, there is no existing law for calling a new election or for summoning Congress to provide for an election.

It cannot be denied that this conjunction of events, though doubtless so remote as to be beyond the bounds of

probability, would be highly interesting if it should actually occur. It is reasonable to believe, indeed in view of what we have lately seen and heard of the third term claimant it would be difficult to believe anything else, that if and whenever it should occur he will be crying aloud that he has been cheated of the election, and that a large number of people will believe him. It needs the addition of but one element to set the stage and furnish all the paraphernalia of a revolution, and that element is supplied by the circumstance that Major-General Leonard Wood, the original creation and bosom companion of Theodore Roosevelt, a man of whose personal characteristics the public knows but little, is in command of the army.

We are accustomed to think that revolutions are made of blood and gunpowder. It is not so. The thing may be done, and has been done, without the firing of a shot. A revolution around the corner, as it were, while the people are not looking, might be regarded as impossible but for the fact that there are just such events in recorded history. We have long been in the habit of regarding ourselves as exempt from the calamities that afflict and sometimes destroy other nations. This is only the delusion of ignorance. What has happened to others may, under similar conditions, happen to us.

I do not think, however, that there is any occasion for excitement or the burning of red fire. There are several reasons for this conclusion. First, failure of election of a President, both at the polls and by the House of Representatives, is highly improbable. In the most unfavorable view, a change of position by less than half a dozen representatives, perhaps by two or three, would enable the House to make an election. Still more unlikely does it appear that the Senate would fail to make choice of a Vice-President. Neither is there at present any substantial reason for believing that the commander of the army would lend himself to an attempt to seize the Presidency by force, nor that our army could be made the instrument of so desperate an enterprise. Finally, and of most importance, there is in my opinion a constitutional way out of such a difficulty, which may be and ought to be perfected in advance of the event.

The specific grants of particular powers to Congress, in Section 8 of Article I of the Constitution, are supplemented in the same section by a general power "to make all laws which shall be necessary and proper for carrying into execution the foregoing powers, and all other powers vested by this Constitution in the Government of the United States, or in any deparment or officer thereof."

Omitting the words which are immaterial to the present purpose, this clause may properly be read as an express grant of authority to Congress "to make all laws necessary and proper for carrying into execution all powers vested by this Constitution in any officer of the United States." The event against which it is necessary to provide is the suspension of the powers of the President, thru failure to choose at the proper time any person who may lawfully exercise them and thru lack of any standing law authorizing their exercise by any person. This is plainly a case for the making of a necessary and proper law for carrying into execution the powers vested by the Constitution in the President, which seems to be directly authorized by that clause of section 8 above quoted.

It is, so far as I know, unaccounted for and unaccountable that provision was not made in the Succession Act of 1880 against an emergency of this character, and others which might lead to the same result of putting the Presidency in limbo. The actual purpose of that act seems to have been principally if not wholly partisan, tho perhaps not more in the interest of one party than of another. The act of 1792, in force in 1886 as Section 146 of the Revised Statutes, enacted under the authority of Section 1 of Article II of the Constitution, which declares that "the Congress may by law provide for the case of removal, death, resignation, or inability, both of the President and Vice-President, declaring what officer shall then act as President," prescribed that in such event the President of the Senate, or if none, the Speaker of the House of Representatives shall act as President until the disability is removed

or a President elected. It was deemed anomalous and objectionable that the powers of the Presidency should pass, in the middle of a Presidential term, to an officer who may be and often has been of the political party opposed to the President, thus changing the political character of the administration without any action of the people. The Succession Act of 1886 removed this objection by repealing the succession of the President of the Senate and Speaker of the House and substituting succession by the Cabinet officers, and it accomplished nothing else.

Public attention has been sharply called on more than one occasion to this dangerous gap in the fundamental law, especially in the election of 1801, which exposed the weakness and led to the abolition of the original electoral scheme of the Constitution, again in connection with the election of John Quincy Adams by the House of Representatives in 1824, and in the Hayes-Tilden controversy of 1876. The hand-to-mouth policy of our National Legislature in providing for the day only what is sufficient unto the evil thereof, leaving this menace perpetually overhanging the Government, has been the subject of severe and deserved criticism by political and historical writers at home and abroad, and goes far to justify the opinion that the American Congress, in view of the vast scope and magnitude of the interests which it has in charge, its manifold sins of omission no less than of commission, and its general incapacity to rise to the level of statesmanship on the most important occasions, is the most incompetent legislative body in the world.

BOSTON, MASS.

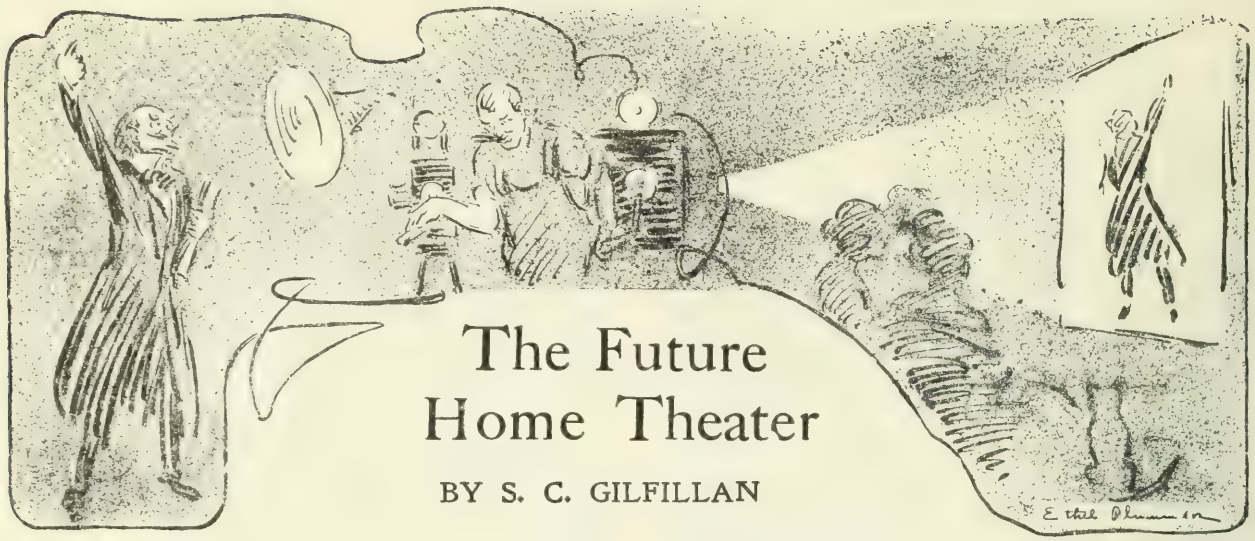
"As Ye Did It Not"

BY CHARLES L. GREAVES

JESUS CHRIST is passing by,
Throw thy cheerful casement high;
Haste, oh haste! bid Him abide
This day with thee, the Crucified!

"Nay, nay, it is not He,
No lambent glory do I see,
No angels fill the throbbing air,
No being passes, kingly, fair;
'Tis but a beggar in the throng,
Who drags his shuffling feet along,
All weazened, wrinkled, pale of face,
He treads the street with weary pace."

Haste, oh haste! He comes again,
Jesus walks the ways of men,
Thy door throw open, open wide,
And draw the heavenly Guest inside!



"Nay, nay, no star I see,
I hear no holy minstrelsy,
No ringing shout, no kingly cry;
'Tis but a child is passing by,
All soiled and touseled, of the street,
With hatless head and shoeless feet,
Pushed, and jostled, giving place
With timid tread and pitiful face."

Jesus Christ is passing by,
He is coming, He is nigh
He is looking to your door,
He may never pass you more!

"Nay, nay, ye do but jest,
For I see no holy Guest,
No hosannas do I hear,
Proclaiming that the Lord is near;
But I see a swarthy slave,
Bending neath his burden grave,
Numb and silent in his woe,
Down the sultry roadway go."

Blind, blind! ye would not see,
Jesus Christ came thrice to thee;
Pray, that on some sad tomorrow
He doth not despise thy sorrow,
When thou tread'st the tearful way,
That the Saviour trod today.

HAWKINSVILLE, GEORGIA.

The Future Home Theater

BY S. C. GILFILLAN

[What gives this prophecy both timeliness and corroboration is the first demonstration of a new form of primitive home theater, which combines the kinetoscope, phonograph and telephone, and promises to be of very great value in large halls.—EDITOR.]

THERE are two mechanical contrivances, one now taking its first unsteady steps in the commercial world, the other still in inventors' laboratries, each of which bears in itself the power to revolutionize entertainment, doing for it what the printing press did for books. They are the talking motion picture and the electric vision apparatus with telephone. Either one will enable millions of people to see and hear the same performance simultaneously, by the "seeing telephone" and the telephone, or successively from kinetoscopic and phonographic records of it, with the result that a matchless production may be attended for almost nothing. Furthermore (if we may use a dogmatic style, but offering proof), these inventions will become cheap enough to be, like the country telephone, in every home, so that one can go to the theater without leaving the sitting room. From this fact we may call both devices the home theater.

One of them bears entertainment into the home by the telephone wires. To witness a play, speech, lecture, music or dance one will simply throw a switch or two and the voices will be heard, while a picture in motion, naturally colored and apparently three dimensional, will be projected on a wall of the room. A view of moving objects has already been telegraphed by Professor Rösing, of St. Petersburg, and by a number of other inventors, but their apparatus is not yet perfected. The other home theater, the combined phonograph and kinetoscope, is now in commercial use. To come into our homes it needs only to have its reproducing apparatus cheapened; the records can be borrowed from a library. Or, still more conveniently, it can be combined with the electric home theater, so that a person wishing to see a certain production may simply telephone the library to play their records of it into his wires.

The home theater has been a dream of Bellamy, Wells and other prophets, but now it is a thing invented twice over. Its forms are both crude, of course. But are our locomotives like Stephenson's, or our automobiles like those of the nineties? One element, the phonograph, is already often mistakable for a human voice, and the kinetoscope is being adapted to color photography and stereoscopy. The screen of the future home theater will not have the flat, flickering, black and white pictures of today, but scenes like those in the ground-glass plate of a camera, fresh and bright with blue sky and green foliage, or the tints of a close-by face. And by stereoscopy the scenes will be more yet—three dimensional, not flat pictures, but vistas of reality. To this add music or the natural voices, and you have the home theater of 1930, oh ye of little faith! It is just as certain that the home theater *will* be improved as it is that color printing *has* been improved.

The electric form of home theater, to describe it more fully, sends sight and sound instantaneously from a central stage to millions of homes, using wires which also serve for telephone and telautograph. The sound is increased by a microphone, so that one can hear plainly anywhere in a room, and the moving colored stereoscopic picture is thrown on a wall. At the other end of the wire actors play on a stage of a central theater, which at first will serve a city and its suburbs, and then, as the difficulties of long-distance transmission are overcome, an urban district and then a time belt or a whole lingual country. If the actors need an applauding audience for inspiration one can easily be secured, but this is not used today by the motion picture producers. The writer has seen Florence Turner, leading woman of a moving picture company, playing tragedy before an audience of a few managers and bystanders and the camera. It is usual in pathetic scenes to have sad music from a violin off stage, but Miss Turner needed none. She played sheer emotion herself, so that the group stood wordless and the only sound was the low metallic purring of the shutter. She knew well that she was playing to millions all over the world.

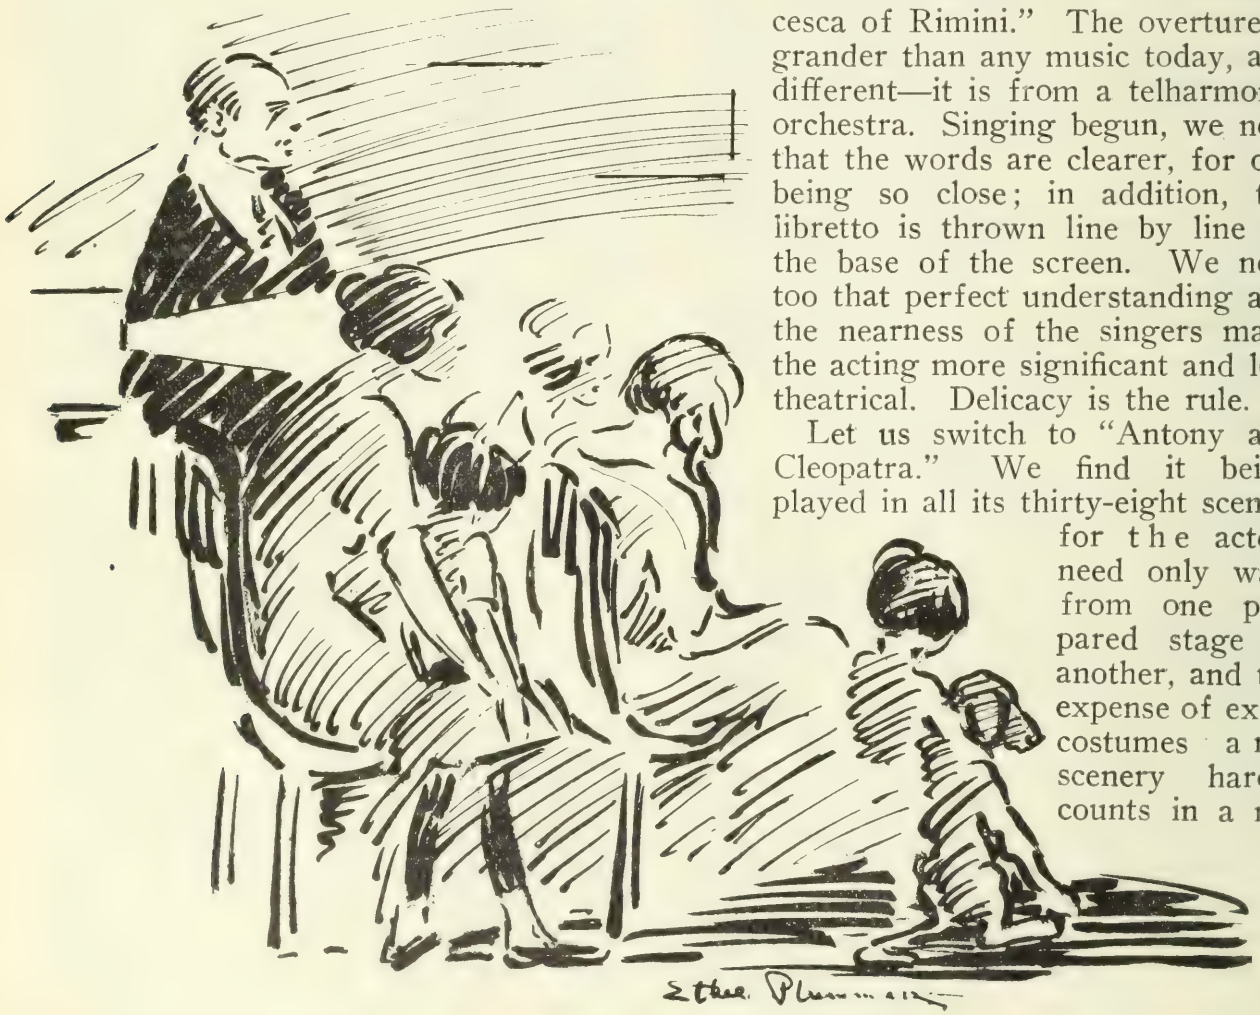
In the same central plants, and often from the same productions, the records for the disk and film theater will be prepared. There are two French companies already producing these "film parlants" for use in motion picture theaters. Toward making them cheap enough for the home Edison has brought out his school kinetoscopes, in which the apparatus is simplified and the 1,000 foot reel put into 75. Films have always been rented, not sold, and the public libraries, some of which are already lending out phonograph and piano-player records, will without doubt see the value of supplying home theaters to homes. They will lend records over the counter and also supply printed catalogs, so that one can have any play that is in the main city library by merely looking up its shelf number and telephoning for it to be played into one's wire. But this very convenient combination of the two forms of theater suffers from having the mechanical imperfections of both systems.

The peculiar ability of the disk and film theater is to preserve, to halt time. We shall see the actors of the past play again, dead orators will speak, the Panama Canal can be reopened. Independence of time again enables it to represent the supernatural, by merely concealing an interval, as when in moving pictures we see a man vanish into the air. And by doctoring films centaurs, elves, earthquakes, murder, everything to be seen on canvas or in joke books will become the material of the playwright.

The disk and film theater can easily use natural scenery, for the players have time between scenes to travel from one spot to another. A natural setting is more beautiful, more correct, and may even be authentic. A recent motion picture drama about the battle of Lexington was fought over again on the bridges and fields of the original. As for beauty, we may use the Piazza San Marco and the Alhambra's Court of Lions and every lovely spot between Lake Tahoe and the Vale of Kashmir. The scene painter's poor versions laid aside, we need only give the actors temporary eminent domain over our places of interest and beauty to make as great an advance in scenery as our present stage has made over the Elizabethan.

The electric theater as well will come to use natural scenery somewhat when it has been adapted to "see" in the twilight of the evening and in moonlight, so that a troupe can play to evening audiences without the necessity of being 30 degrees to westward of them, and still more when we have learned to superpose actors upon a record of natural scenery. But instantaneity is a recommendation also. By the electric theater a whole nation will be able actually to see an inauguration, a launching, a ball game, or a first performance. It will not seem a mechanical device, but a window or a pair of magic opera glasses thru which one will watch the actors or doers.

Since the two forms of home theater are better for different purposes they will doubtless exist side by side. The electric form will publish the more timely and popular productions; the disk and film those involving the supernatural or past actions. The electric will be the cheaper and more convenient, and it had fewer



problems to solve to become available in the home, but the disk and film has a few years' start of it.

The two forms will often be combined by playing records into wires, not only at libraries, but also at the central electric plants, on anniversaries, for instance, to recall the events being celebrated or the great man who in one sense had died.

There will be wide variety of offerings, even in the communal electric theater, for there will be many stages in a producing plant, each connected with the telephone centrals of the country, from which last one could have whichever of the productions one desired. On some evening of 1930 we may find in the newspaper such a program as the following:

Tschaikowsky's "Pathetic Symphony," by the Eighth Telharmonic Orchestra. Popular Music, Telharmonic, instrumental and vocal. "Coppelia," by the National Corps de Ballet of South America. "Francesca of Rimini," grand opera. "Antony and Cleopatra," by William Shakespeare. Thirty dramatic sketches. A reading by Shaemas O'Sheel of some of his poems. "When Sappho and Alcæus Sang," reënacted history. Recent Finds at Herculaneum, by Guglielmo Ferrero. The Annual Metropolitan Exhibit, First Section of Paintings, with comments by X, Director of the Museum. Los Angeles at the Moment; glimpses from various viewpoints in the city, with ciceroni. Winnipeg vs. Gary, championship baseball game. "The Management of Monopolies," by Y, candidate for the Presidency.

Lectures can be interesting in the home theater; suppose we hear Ferrero on Herculaneum. We adjust the telephone and he appears on the wall before us, speaking in a quiet tone. Soon he shows us one of the new-found statues, turning it around, now holds a seal ring under the magnifier, now calls up people attired like the old Herculaneans, now introduces us to the officials in charge of the work.

Let us hear an act of "Francesca of Rimini." The overture is grander than any music today, and different—it is from a telharmonic orchestra. Singing begun, we note that the words are clearer, for our being so close; in addition, the libretto is thrown line by line on the base of the screen. We note too that perfect understanding and the nearness of the singers make the acting more significant and less theatrical. Delicacy is the rule.

Let us switch to "Antony and Cleopatra." We find it being played in all its thirty-eight scenes, for the actors need only walk from one prepared stage to another, and the expense of extra costumes and scenery hardly counts in a na-

tional theater. The plays of 1930 are written with still more scenes, for the best way to tell a story is to tell its every important incident. The old motion picture shows had an average length of scene of about fifty seconds.

If we elect the thirty dramatic sketches we shall find that brief scenes have made very short plays possible, even ones of three seconds. To skim the cream of a plot there are five-minute versions of a tale with a sting in it, and bits briefer still which are actings-out, electrifications, so to speak, of our anecdote, our joke with a picture and our story told in pictures. Some are sympathetic, most are satirical, and all are lightning character sketches.

Some dramas are to be much longer than any of today, since convenience and cheapness allow shows of more than one sitting. That History of Greece is to take a year, in instalments each evening from seven till a quarter past. The limits of drama have been made as wide as those of literature, which are the single word and the ten-volume novel. In drama and opera, too, the breaking up of these restrictions as to time, scenery, the supernatural, etc., which only hamper the playwright's thought have made drama more perfectly bendable to teaching and entertainment.

"The play—the play's the thing!" as Shakespeare said, and he ought to know. For proof he might have put it that all the players are merely men and women. Drama is the Art of human life, and of all arts the most universally appreciated. When freed from cost and trouble and the crudeness of motion pictures it will be the dominant art, and the chief recreation in most people's lives.

Opera, when understandable and not prohibitively costly, will perhaps stand next in popularity, but the other classes of music will rival it. The dance and the art exhibit will amount to far more than they do to-day. The lecture will be developed into an art, and oratory be reborn when for the first time in history it will be worth while for a really great man to give his genius to a speech intended for ordinary people, not legislators. The great write, that they may give their thought to millions. But a page of print is something less than the author himself.

Home theater art will be better than any to-day. For not only will the bad and mediocre artists be massacred in their thousands and the great heaped with honor and riches, but the great will be introduced to a new competition, that with the great dead. Sight and sound records mean that the actor, singer, dancer, musician and orator will, like the painter, writer and composer be inspired by the masters of the past, and taught and competed with.

The moral tone of the home theater will be excellent. For the electric form, like the motion pictures, but in much greater degree, will be supported by family audiences. And the disk-and-film form will be dominated by these and the public libraries, in the main, and for the rest the inevitable concentration of the producing industry will make easy the protection of the innocent public. Some such body as the present National Board of Censorship for Motion Pictures will be given legal power to review all productions and either delimit or forbid their circulation.

There will be enormous educational value in the home theater, just as there is in the analogous inventions of printed words and printed pictures. From these two we have derived almost all our education, including a rough knowledge of the visual aspect of almost every important thing and person that is or has been on the earth. But would our knowledge of Greek history, for example, be so rough, so hazy, if we had watched and listened to that long historical drama of Greece, where every fact was presented in the most interesting and vivid form, and the really essential part of history, the civilization of the epochs, was portrayed as it could be by no other medium? And lectures, giving us all of Naples but the smell, and all of chemistry but the drudgery, will cover well nigh every field of knowledge almost as attractively. The home theater will be of far more educational value than the motion pictures, good as they are, and be attended twenty times as often. The State will probably require that each house or apartment contain a branch of the electric theater, on the principle of self-preservation which calls for a compulsory school attendance law. But even in the most ignorant homes compulsion can stop with the installation.

"TO WANDER THRU THE LOUVRE WITH WILLIAM M. CHASE"

Outside of education lies culture, the appreciation of beauty in ideas, aspects, sounds and gestures. The home theater will impart culture—remember that we shall be wakened from sleep by Hoffmann playing, to wander thru the Louvre with Chase, and in the evening sit at the feet of Maeterlinck, or before the great artists of the stage.

To make room for its own life the home theater will strike right and left among our institutions. The theaters and nickelodiums, of course, and orchestras, will almost all go, as already the melodrama houses have been practically abolished by the "pictures." The novel and the short story will fall from their pinnacle, the all-story magazines are already feeling the motion pictures' competition. The schoolhouse Edison is preparing to invade with his educational films—how far will these replace the teacher when to sight are added speaking and color, depth and perfection? What about churches, the rural ones especially, in competition with national churches which offer glorious music and the best preachers in the land? What will happen to our political forms when a candidate must appeal directly to all the electorate, revealing his personality

by his close range appearance and normal voice? Will representative government survive this nation-wide extension of the neighborhood in which a man can be known?

The home theater, in contrast to most modern developments, will tend powerfully to preserve the home, as the newspaper has by superseding the Athenian barber shop, the Roman forum and the Queen Anne coffee house. And to those who live in small towns and the country the home theater will be a minister of life.

How soon shall all this come to pass? The chief obstacles to the home theater's growth are not on the mechanical side, but the human. The public must be taught the value of the novelty, new orders of playwrights must be trained up and great companies must be developed in a totally new business and controlled.

But a limited use will come soon. The disk and film form, being already in five-cent theaters, ought to reach some private homes by the end of the decade. Of the electric theater a fairly complete form for sound has been in use in Budapest for a dozen years. It is called the *Telephone Herald,* and distributes hourly news, editorials, speeches, language lessons, music of all sorts and the audible part of the town's best plays. In this country a similar thing has been in Wilmington for two years, and is now appearing elsewhere, and the telharmonium will open this winter in New York. If the industries, political included, which the electric theater threatens, do not forbid it to be born, as they endeavored to strangle the telharmonium, it ought to appear in a few theater buildings about five years from now, and be in the majority of homes within twenty.

New York City.

The Parties and the Supreme Issue

BY JOHN B. CLARK, LL.D.

[Professor Clark has been since 1895 Professor of Political Economy in Columbia University, and has written much on his subject. He is at the head of the Division of Economics and History of the Carnegie Endowment for International Peace and is an authority of the first rank for the subjects of which he treats.—Editor.]

A UNIQUE fact in the pending canvass for the Presidential election is the equanimity with which a majority of the people regard it. The intellectual interest in it is keen, but there is little real anxiety about the outcome—partly because there is no great uncertainty about it, and partly because few people would regard the election of either of the three leading candidates as a disaster. A vast number have either not decided for whom they will vote or have reached only a tentative decision, which it would not take much in the way of new light to change. One cause of this indecision is the high character and the superior ability of all three candidates, and another is the fact that they stand upon platforms all of which, ten years ago, would have rated as progressive. With regard to these platforms, however, what interests the people is not so much what they say as how sincerely they say it, and how likely the parties are to act according to it. The people are making up their minds as to tendencies, leanings and seen and unseen influences. They want certain results and will take the course which they think will give them.

The Republican Party.—The Republican party, tho less progressive than the others, is not reactionary. It proposes no backward step in the march of democracy, but has been careful not to advance at a double-quick step. It would require, however, only a small change in its recent program of action to make it more drastic than either of the others proposed. The overshadowing issue of to-day is the treatment of great business corporations. The Sherman law, inter-

preted in the light of so much reason as has recently been exemplified, would break up consolidated companies into rather numerous constituent parts, but would allow the parts to be held together by a "community of interest" more perfect than any which the eminent financier who introduced the name and the measure ever dreamed of. It is clear that if, after such a division, the units act in complete concert, if the prices of their products do not fall and their monopoly is as strong as ever, a rule of reason calls for some addition to the law. Though the buying and selling of stocks will in time trench somewhat on this community of interest, one must wait for a generation before this process will go far enough really to break up the consolidations. Yet if the stock held by one owner had voting power in only one of the corporations, the situation would take a very new complexion, and it is startling to think what might thus be done by a very simple legal change in the accepted policy of the Republican party. If, however, the people should give this party a new lease of life, the action would be interpreted as meaning that they endorse its policy, not as it might be, but as it has been. The vote would be a mandate calling for conservatism and rebuking excessive progress.

Every platform promises to obey the moral law and specifies ways in which it will do so. In labor legislation, in hygienic measures, in improving the currency and the banking system, in conserving natural resources and means of transportation, in reforming court procedure and in other equally obvious ways every party knows that the people expect it to do its duty and promises to meet the expectation. The doubtful and critical issues are those which concern the trusts and the tariff, and they are closely intertwined. Effective control of trusts requires a modification of the tariff. Till recently such a reform has been a dream with small prospect of materializing, and it is the trusts that have lifted it from that position. The reforming of the tariff has a bearing on the treatment of monopolistic corporations. Tho protective duties are not the only cause of their existence, they are the source of much of their power. They make exorbitant prices possible in the American market, and leave a trust free from danger from foreign rivals and able to use its resources in crushing competitors at home. They build up a vast and sinister power in politics. The Republican party has fortified the case against itself by making the people expect very little relief from this condition so long as that party is dominant. To the question, "Will you control the trusts, and, to that end, will you reform the tariff?" the practical action of the party has given the answer which the people believe, and it has not been found satisfactory.

The Progressive Party.—The Progressive party enters the field with one large advantage. The trusts will have to be controlled by the Federal Government, since States cannot do it. No opposition to this use of the Federal power can last very long, and there is no opposition now that counts. The people need the protection of the general Government and will have it. To this extent we are all nationalists, and this fact puts us in some sympathy with the "new nationalism" of the Progressive party. We all prefer getting what is of vital importance rather than losing it by a too cautious safeguarding of local rights under a written constitution. We may differ as to the extent to which this Federal activity should go, and some may act on the injunction in the familiar motto which says "Be bold" and others on the one that adds, "Be not too bold." Drawing a line between the two tendencies is an interesting theoretical exercise; but practically the people are drawing it, in their own irresistible way, by making the Federal Government perform one service after another as new needs arise. If this is nationalism let us make the most of it. Wo be to a party that here tries to stand against fate. In the practical case that is before us for decision no body of citizens has the temerity to do it, and all of them know that the Federal Government must control the trusts. The platform of the National Progressive Party calls, in broad terms, for a general and effective control of trusts by an administrative commission, and the utterances of its candidate give reason for believing that, if elected, he would

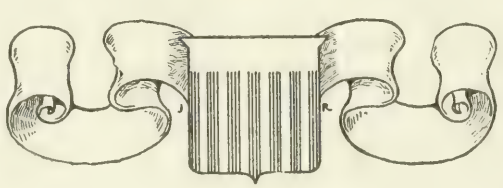
use his powerful influence in favor of reducing them to good behavior. Doubtless the party would take measures to stop the local cutting of prices for the sake of ruining independent producers, the "factors' agreement," which boycotts the customers of independents, the securing of special rates for transportation and kindred practices. It would make good rules of the ring and give rivals of the trusts a fairer chance to survive.

Fifteen years ago these measures would have seemed in themselves sufficient; but at present they do not. They constitute an indispensable preliminary program and would help powerfully in keeping competition alive. There is not one of them that can be omitted with safety. There is a popular impression that the Progressive party has another measure in view, as its main reliance, namely, the regulation of prices by a commission. Rightly or wrongly, the people have concluded that its policy is to draw a distinction between good trusts and bad ones, calling those good that observe the rules of the ring, and letting them alone. If, as a result, most trusts become good and still remain monopolistic, it will be necessary to regulate the prices of their products thru an administrative commission.

The danger from this policy lies in the innocent appearance that it presents to those who have not gone deeply into the economic questions. The fatal objection to price regulation is very little appreciated. Every one perceives that it would be a complex and difficult operation and full of chances of error and of corrupting influence. With many people, indeed, this objection alone suffices; but there is another which is much more serious.

The summum bonum of Economics is progress in production—a continual increase of the power to create wealth. Nothing less than this can make wages rise and cause conditions of life to improve. With the world crowding itself more and more densely with people, the art of extracting a living from it must be practised more and more effectively. We must invent new machinery, discover new raw materials, use new motive powers, apply chemistry to the soil and in every way strengthen the hand of the laborer in his battle with Nature. Otherwise humanity will grow poorer with every passing decade. The only thing that can guarantee such progress is competition. That only can turn the increasing poverty into increasing wealth. If we surrender to the monopolies, we shall invite the increasing poverty, for monopoly is hostile to progress. Trusts would become far less progressive than they now are if the prices of their products were regulated by a commission, even tho that body performed the miracle of adjusting them all honestly and intelligently.

Any monopoly is reluctant to make a proper use of a scrap heap. When it is secure in its power it will adhere to its old methods and keep its antiquated appliances rather than make a sacrifice in order to get new ones. Why should it do so when its prices are so regulated as to give it a fixed return on its capital? A commission, in fixing prices, would count the cost of an article, add a reasonable profit and adjust the rate accordingly. When a producer lowered the cost of his product he would invite a reduction of the price of it. A mode of price regulation might be devised which would partially obviate this evil; but the progress which it might possibly ensure would not be comparable to that which exists under the spur of competition. We must see to it that the trusts do not monopolize their several fields; and while in this brief article we cannot show how this can be done, we take the responsibility of asserting that it can be done and that, too, by methods which are now in sight.

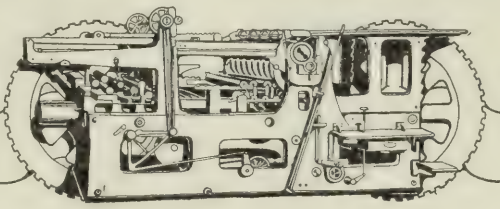


How then shall we judge the Progressive party if the test is its probable course in dealing with trusts? The people do not credit its leader with giving much attention to protective duties, and unless its followers perceive that these duties have a connection with the problem of monopoly, force their leader's hand and compel reforms, there is no strong reason for expecting vigorous action in this direction. If the hand really is reluctant, it will not be an easy one to force. Repressing predatory competition is thoroly admirable, but doing that and nothing more may amount to

a surrender to monopoly. A proposal of price regulation implies some expectation of thus surrendering. If the party does not have this expectation, it should lose not a day in making that fact clear and in showing what it will do to preserve competition. In the continuance of competition lies the sole prospect of that increasing productivity by means of which alone the alluring hopes which this party holds out to the laboring class can be realized. By its pledges it is almost under a contract to produce, if placed in power, a condition of prosperity for laborers. It is a vast contract and can be partially fulfilled only by action that is not in line with what seems to be the party's purposes. If the leaders can show that this is not so, it behooves them to do it.

The Democratic Party.—There are those who think that the question as to which party can succeed in the election is quickly answered by a rule of exclusion, since the Democratic party is the only one which is practically undivided. Much depends, however, on its attitude toward trusts and the tariff, for only by excelling the Progressive party in this particular can it draw many votes from its rivals. Its platform is certainly not above criticism, and for the clause which asserts that a protective tariff is unconstitutional, the best apology that can be offered is that it is a temporary lapse from common sense. If said seriously and deliberately, it would mean "strict construction" of the Federal constitution raised to the *n*th power. Happily the probable action of the party is foreshadowed by other official utterances, and these give promise of a moderate and reasonable reform of abuses in the present tariff. This plan accords well with an intelligent policy in dealing with trusts, and the actual policy of the party is intelligent. It proposes to exclude from interstate trade companies having the clear characteristics of monopoly and recognizes as one of these traits, "the control by any one corporation of so large a portion of an industry as to make it a menace to competitive conditions." There are difficulties in the way of applying this test, but the worst that can be said about them is that it will take wisdom and earnest effort to overcome them. A party which declares that it will not let a corporation become big enough to be a monopoly will certainly never admit, in advance of complete proof, that competition is dead. To admit this and act on the admission would be the most fatal error that the people could fall into. It would be like pronouncing life extinct in a man the moment he fell into the water. Competition is clearly existing under difficulties. In spots it looks moribund; but not even in transportation is it absolutely dead and elsewhere it has great remaining vitality. Said the Democratic candidate in a recent speech: "We propose to introduce (if I had time I would show you how it could be introduced) competition again." The vital incentive of progress, the hope of large future production, the prospect of a rising level for human life are staked on this restoration of the force that ensures them. The keen rivalry of producers can do this; but nothing else can; and a country would deserve to perish itself that should let competition perish without using the last atom of its strength in the effort to preserve it. Here lies the heart of the practical issue between the parties.

The present writer is a Republican, the descendant of Republicans, Whigs, and Federalists. Tested by general views of the Federal constitution, he thinks both his hereditary party and the new Progressive one have the advantage over their common rival. By the test of practical action in the most vital issue of the day he concedes that the Democrats win.



New York City.

The Scientific Analysis of the Press

BY ALVAN A. TENNEY

Assistant Professor of Sociology in Columbia University.

THE effectiveness of the various forms of government was long ago ascertained with some degree of accuracy. Within limits men know what to expect from a despotism, a constitutional monarchy or a democracy. The public has learned also how to distinguish a Tweed from a reformer. The various forms of government and the various kinds of men who govern are recognized as types that function with some degree of regularity.

Analysis has to some extent gone back of both the forms of government and the personalities of the men who govern. In those municipalities where live ignorant and heterogeneous populations we expect the boss. In communities composed of an intelligent and alert body of citizens, whose desires are many but reasonably harmonious, we expect thoro discussion and efficient public action. There are known conditions which produce good government.

In similar general fashion we know what conditions are necessary for the production of an intelligent body of citizens. Among these conditions are prosperity, schools and the means for public discussion. To discover the road to prosperity, economics is applying scientific method. To discover how to obtain the best schools educators are also applying scientific method.

To discover how to obtain the best means for public discussion, however, no thorogoing investigations have yet been made. What is actually known, for example, concerning the net stimulus to public opinion given by the 25,000 daily papers of this country? Practically nothing. Most men are acquainted merely with the character of not more than one or two newspapers and a half dozen magazines. A few experts know in a general way the "policy" of possibly a hundred periodicals. Nobody, however, knows in exact terms even such a simple quantitative fact as the relative proportion of attention paid by the newspapers of the country as a whole to matters of cultural interest compared with the amount of attention paid to topics of a political or business nature. Even in the political field no one can state just how much increased attention has been given by the press of the nation during the past few years to the subject of socialism. Yet it would be of practical value to know the facts. It would then be possible to investigate the truth of such a proposition as that the vote of the socialist party rises and falls in proportion to the degree of attention paid to socialism in the press. More important still would be the opportunity to prove whether or not increased attention to socialism by the press precedes an increased socialist vote or *vice versa*. As socialism in this country has thus far made its chief gains in particular municipalities, the possession of facts by which to show whether or not the same degree of press attention has uniformly preceded an increased socialist vote in those particular municipalities might throw some light on at least one of the possible factors producing the change. It might be possible thus to advance the exact analysis of social causation another step.

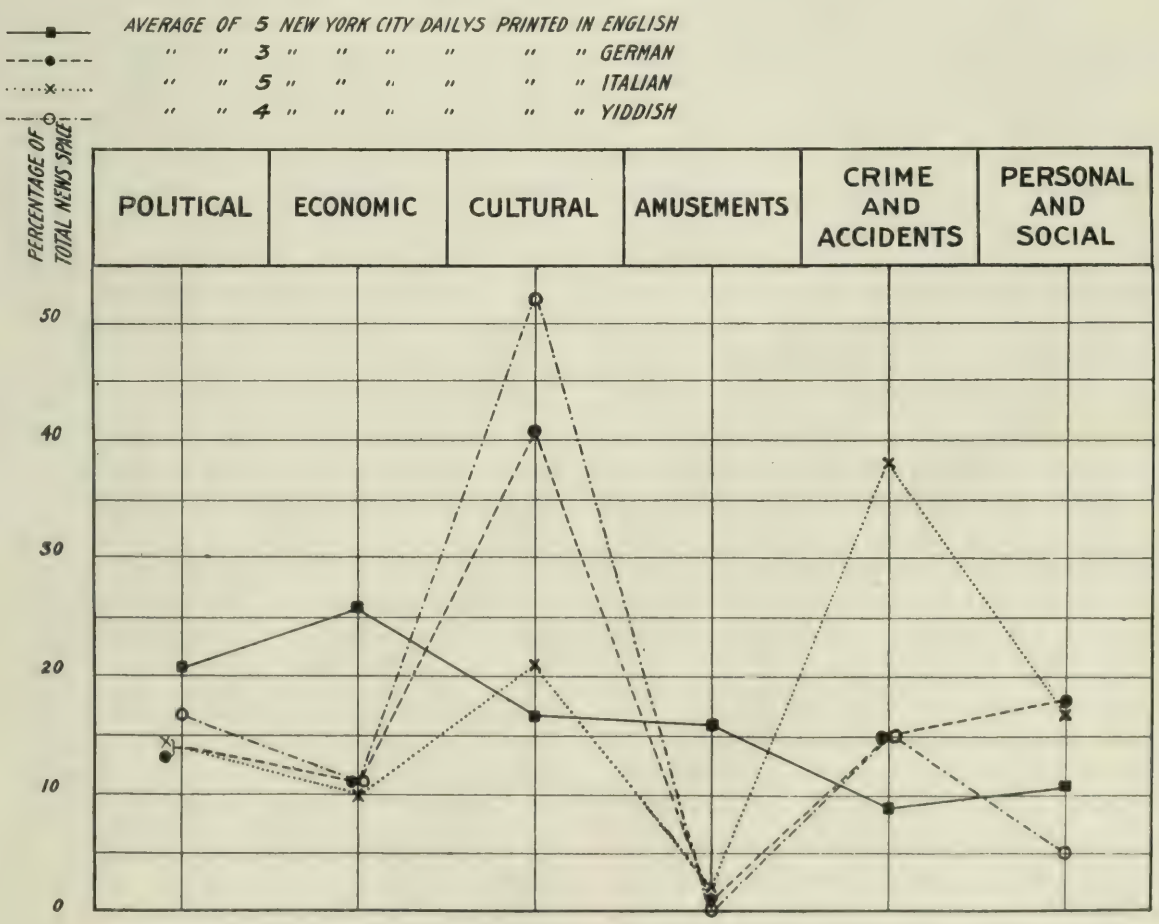
Similar exact knowledge concerning the relation of press attention to other

matters, such as civic reform, legislation on finance, taxation, labor and business, the commission of particular forms of crime and other topics of public concern might also throw some light on the problem of social causation.

To anticipate fairly close correlations pointing to causal connections on such topics as have been mentioned, is no more unreasonable than to expect definite results from advertising. The advertiser knows from careful bookkeeping when, where and how advertising pays. By analysis of his results he learns both the best method and the exact cost of producing certain definite changes in the public mind. He thus obtains accurate knowledge of how to make people think what he desires them to think.

Why should not society study its own methods of producing its various varieties of thinking by establishing an equally careful system of bookkeeping?

The first step in the investigation of such questions as have been suggested is to obtain data concerning the degree of attention paid by the press to the various topics it actually notices. Equipment for continuous analysis of the press of the entire country, or even for analysis of the material sent out by the chief news-supplying agencies each day, would require the continuous services of paid investigators. That an extended trial of such continuous analysis should be made, however, is perhaps a justifiable conclusion from the results of an experiment made by certain students of sociology in Columbia University last year. The first part of this experiment consisted in measuring the number of linear column inches of space devoted on the average by various newspapers to each of the various classes of articles or items published. For example, it was ascertained concerning a prominent New York City daily that, out of a total of 16,572 column inches devoted to news in 13 issues, cultural topics occupied 2,194 linear column inches, economic matters 5,107 inches, political 5,514, other topics 3,757. The amount of space devoted to various subdivisions of these main classes was also ascertained. By applying the same categories and method to several periodicals, material for a number of comparisons was obtained. The periodicals studied were 17 New York City daily newspapers. The choice of individual newspapers was made partly in accordance with the preferences of the volunteers who did the work of classification and enumeration. Of the 17 New York City dailies, 5 were published in English, 3 in German, 5 in Italian and 4 in Yiddish. With the exception of a slight study of advertising in one Italian paper, attention was directed exclusively to the news—defined as everything printed except editorials, illustrations and advertising. Of the papers published in English 13 issues each were examined, of the German 6, Italian 6, Yiddish 7. The total news space measured was for papers in English 98,497 inches, German 13,099, Italian 14,218, Yiddish 33,768. For purposes of comparison the figures of gross space devoted to the various classes of news were reduced to percentages of the total news space. For example, the 2,194 inches of news space devoted to cultural topics in the 13 issues of the New York daily previously mentioned constituted 13 per cent. of the 16,572 inches of news in those issues; economic news occupied 31 per cent., and political 33 per cent.



In the chart on the next page such percentages are represented graphically for the news topics: Governmental, economic, cultural, amusements, crime and accidents, and personal, derived from the total figures for each topic in each class of journals studied.

The most striking facts reflected in this figure are the high rank of dailies published in English in political and economic news, the low rank of the non-English-language papers in these categories, the extraordinarily high rank of German and Yiddish dailies in cultural news, and the extremely high proportion of crime and accident news in the Italian dailies. It is true that there was considerable variation among the individual papers composing the various classes represented in the graph. Nevertheless, if each of the seventeen papers were to be represented by a separate line, even the extreme variations, with but few exceptions, would not in any category be found to remove any member of a class

from the relative rank of the average of that class. This simply means that the individual papers did not vary so much from the average of their respective classes as to render the comparison of averages misleading. The five papers printed in English were less alike than were the representatives of any other class. For these five papers the variation from the highest percentage to the lowest was: for political news, from 33 per cent. to 16 per cent.; economic, 32 to 16; cultural, 23 to 12; amusements, 26 to 8; accidents and crime, 16 to 4; personal, 14 to 7. These variations, even tho they do not invalidate the comparison of average rank, are nevertheless great enough to be significant.

Comparison of figures in more detailed news divisions than the six represented in the graph yielded some curious results. It so happens that, of the five New York dailies printed in English, the paper that published the maximum proportion of financial news had next to the minimum percentage of labor news, whereas the paper giving the minimum financial news, published, with one exception, the maximum of labor news. The paper publishing the maximum labor news was next to the lowest in financial news. It would be interesting to discover by further investigation whether this relationship of financial and labor news would hold true for a larger number of papers over a longer period of

Political, Economic, Cultural, Amusement, Crime and Accident, and Personal News, Expressed as Percentages of Total News-Space.

This figure shows the high rank of dailies printed in English in political and economic news, the low rank of non-English papers in these subjects, the extraordinarily high rank of German and Yiddish journals in cultural news and the high proportion of news of crime and accidents in the Italian journals. Of the 52% cultural news in Yiddish journals, however, 20 units were serial story; of the 41% cultural in German papers 12 units were serial story. The percentage of news of crime alone for the Italian journals was 37, of which less than 6 units were due to the Viterbo trial.

time, or is merely a somewhat peculiar coincidence. It would be desirable also to test further the somewhat unexpected result that the paper, in English, giving the maximum to sporting news was found well to the front in cultural news, and that it actually printed more than the proportion devoted to that topic by the paper paying the least proportionate attention to sports. These results throw doubt upon the truth of the popular idea that much attention to sports accompanies little attention to cultural topics.

For the Yiddish and German dailies the 52 per cent. and 41 per cent. cultural news shown in the figure comprehended the following percentages in sub-classes: Serial story, 20 per cent. and 12 per cent. respectively; education, 14 and 6; anecdotes and verse, 2 and 11; drama, 6 and ½; music, 1 and 4½; religion, 2 and 1; letters, 2 and 0; other cultural, 5 and 6. In the Italian papers the 21 per cent. of cultural news divided as follows: Serial story, 10; science and education, 5; art, 5; philanthropy, 1. These figures reflect the known interest of Hebrews in education and drama, the German's love of music and the Italian's of art. A further analysis of the type of serial story published by each class of journals would doubtless show the influence of further characteristic traits.

The category "crime and accidents" revealed the most startling facts of the whole investigation. For the Italian dailies the figure was 38 per cent. Of this only 1 of the units was "accidents," leaving 37 per cent. as the average for crime alone. Of these 37 not more than 6 units were due to the Viterbo trial, and as far as known there was nothing else to render the 37 per cent. other than typical. This class of news in the various Italian papers of New York City ranged from a maximum of 45 per cent. of the entire news space to a minimum of 25 per cent. Thirteen issues of a standard daily, published in Italy at about the same dates, showed only 8 per cent. "crime" news. The 37 per cent. of "crime" news was subdivided as follows: Trials 16, arrests 4, fights and brawls 3½, bomb and black hand 3½, murder and suicide 3, other crime 7. Such figures seem to sustain the opinion of a leading New York Italian, that "the Italian press of the city has no more constructive value than a band of brigands." In the advertising columns of a single issue of one of the Italian dailies there were 187 insertions of "physician's" cards. Of these 90 were Italian names, 97 non-Italian. In the same issue there were also 69 items advertising medicines.

The necessarily limited experiment which produced these results did not constitute an adequate test of the method. What is needed, as was earlier indicated, is the continuous analysis of a large number of journals. Data would then exist for discovering the exact relation which may obtain between press attention and public action. The records in themselves would constitute a series of observations of the "social weather," comparable in accuracy to the statistics of the United States Weather Bureau.

There is, however, still another use to which the data could be applied that might alone justify an extended trial to discover whether the method here employed will prove valuable when analysis of a much larger number of publications is attempted. If newspapers were compelled by law conspicuously to publish the weekly, monthly and yearly averages of the percentage of attention which, upon continuous analysis of space, they found they were actually giving to various specified subjects, they might soon be advertising their relative rankings, in kinds of news published, as they now advertise circulation. This might lead eventually to more detailed comparisons involving discussion of the treatment, style and social value of the news as printed. Without raising the question of values, however, if the percentage of news attention to a definite set of subjects were continuously obtained a long step toward the scientific analysis of the press would be taken. At any rate, the New York *Times* could then inform us in exact terms what news, on the average, it really does consider "all that's fit to print," and the New York *Evening Post* could tell how nearly, in reality, it is utilizing its space in accordance with the ideals it professes.

New York City.

Where Suicide Is a Virtue

BY H. K. TONG

[Mr. Tong is a young man who came to this country from Shanghai a few years ago to acquire an American education, and after studying at Park College and the University of Missouri he is now a student in the new School of Journalism of Columbia University. He has done all sorts of work on various newspapers from the setting of type to the writing of editorials, for he is ambitious to acquire the experience necessary to enable him to start in China a weekly magazine somewhat after the style of THE INDEPENDENT.—EDITOR.]

MORE than 1,500 people commit suicide every year in Japan, and perhaps 50,000 in China. The causes of most cases of suicide in America are found in economic conditions or in temporary derangement, but in the Oriental countries there are so many causes for it that they defy classification. Some commit suicide because they want to move God to aid them in their noble deeds;. some do it because they desire to stir men to take up the work which they have just feebly begun; some do it for devotion; some for sentimental reasons; some for loyalty; some for economic conditions; some for vengeance; some for a threat; some in the belief that they will become gods; and some as a demonstration of the sincerity of their advice or as a proof that what they wanted to achieve for the welfare of the nation; while a good number of others commit suicide simply because they are tired of living.

The predominant popular conception of harakiri in Japan, however, is that one who commits suicide for the cause of his country usually becomes a god. Thus the Nippon army worship as a guardian spirit of the empire Captain Shima, who performed the rite of harakiri upon the deck of the transport "Kinshumara" in the midnight of April 24 and 25 in 1904, as the ship was sinking. So the Japanese worship Commander Hirose, who, on his first day in bottling up Port Arthur, wrote upon a paper with his own blood: "Thru nine cycles of existence shall I come back to earth till I see my work accomplished." So will the Japanese people worship General Nogi, whose soul is believed by many of his kinsfolk to have traveled together with that of the late Emperor to heaven. Probably Nogi had in mind that he could only in this way follow the Emperor, and serve him there in the next world without intermission. We are not surprised at his old Samurai idea of loyalty, for he was brought up in a warrior family, whose code of honor is to serve the Emperor in life and in death, and he was thoroly influenced by the poetry which describes in the most effective way how such a statesman and such an official committed harakiri for the welfare of their country and became gods. Thus a number of old Japanese believe that they will become divine if they kill themselves for good causes, and as they have worshiped those dead patriots, they would be worshiped by men and women of future generations.

It is hard to tell how the Japanese have got this idea of becoming divine by harakiri, or kappuku, which is the word used by men of refinement. However it is known that Buddhism and feudalism have fostered the spirit of harakiri. Altho the Buddhist teaches that men should not take life, this doctrine is offset by his preaching of metempsychosis—the transfer of soul into some other being or animal according to the merit and demerit of the person, and the ill deeds of his life and the good acts to be rewarded or punished by future avatars. As a result of this doctrine, some persons commit suicide, thinking that their evil deeds are to be redeemed by the sacrifice; and others end their life, believing that the future reward for their good deeds will be doubled by means of their self-destruction. The doctrine of metempsychosis fosters kappuku, while feudalism, which nourishes the military and chivalrous spirit of the Japanese warrior class, makes suicide an act of honor and bravery. Feudalism teaches people to love honor more than life. Boys and girls obey its command by self-destruction whenever their honor is in danger. Seventeen boys of about sixteen years of age committed kappuku after the battle of Wakamatsu about

fifty years ago, in which they had fought bravely by the side of their elders, and were defeated. Following their example, thousands of Japanese men and women at that time ended their lives in the same way. One grandfather is said to have ordered his whole family, including children and baby, to kneel down on a mat in a line. Then he cut off their heads with his big sword and committed harakiri himself, in order not to survive the defeat.

At the same time harakiri is the retreat of honor for those who are hopeless and despondent. A Japanese prostitute committed suicide some years ago in Tokyo, after she had fallen in love with a poor visitor. He had no money to redeem her, and she felt life was not worth living in that infamous house. She proposed to him that they should commit harakiri together, and he agreed. This kind of joint suicide is called "the Joshi," or a suicide compact. Sometimes people also seek consolation in harakiri. About six years ago five Japanese young men from the Tokyo colleges in a moment of despondency, jumped into the Kegon Fall at Chuzenji. Naokuma Yamada, a graduate from the University of Tokyo, cremated himself alive in 1906 in the crater of Mount Aso. A note was found by the edge of the volcano. It reads:

"How mistaken are they who say that suicide betrays weakness of will. . . . But the strongest will is his who can go down to a death that makes men shudder even to hear. . . . Is it not the most blessed ending of human life to be received into the bosom of pure nature and forever to quit the dust of existence? Thinking these thoughts I pass into the smoke of Aso's crater."

Frequently the Japanese people think that harakiri can be employed to atone for wrongdoing. For instance, a father would recommend harakiri to his son who committed any crime in order to save "the face" of the family. Some time ago, it was published in a Tokyo newspaper that a father said to his criminal son: "One death is not enough, and this dishonor must be redeemed by two deaths. Therefore you and I should die to redeem the name of our family."

The Chinese, however, have a different idea in regard to suicide. They do not believe that after "seeking death," they will become gods; and a comparatively small number of people believe that their spirits will live and have power to avenge themselves upon their foes, after committing suicide. Some Chinese women believe that their spirit can unite with that of their dear ones if they end their lives thru devotion. A very small number of Chinese at present believe that "seeking death" or suicide can move God to champion their causes, and can procure for them better life in the future, as Buddhism teaches. Most people commit suicide because they are poverty-stricken and in despair.

There are at least four kinds of "seeking death" in China; namely, suicide for devotion and loyalty, suicide for vengeance, suicide on account of economic conditions, and suicide as an appeal to God or men for help. It is not infrequent in the Celestial Empire, where purity and love are highly valued, that the wife commits suicide because of her devotion after the death of her husband. What is the use of living while the man whom she loves above everything else is dead? That a woman once married should never marry a second husband is an old idea in China, and the people of the present generation still regard it as a virtue, but perhaps do not hold to it to such an extent as our grandfathers and grandmothers did. As a result of this idea of true virtue of 4,000 years' standing, in addition to the belief that her soul, like her body, can live together with her husband either in heaven or in hell, the widow gives up her vain earthly glories and follows her husband to the grave. Sometimes a widow ends her life in order that her body may lie by the side of her husband's coffin. A stone portal is occasionally erected in honor of a woman who thus died because of her pure devotion to her husband. The idea that a monument may be erected as an appreciation of a high type of virtue, tends to enforce a high standard of purity among Chinese women, and at the same time it causes more suicides.

Another kind of suicide under the same class is the suicide for loyalty which was prevalent in ancient China. Many statesmen have committed suicide because the kingdom was in danger, or

the Emperor's life was imperiled. At the end of the Ming Dynasty, many Chinese loyal statesmen ended their lives together with the Emperor. They did not have any idea of becoming divine as Japanese statesmen or warriors had. They were taught by Confucius to be loyal to their Emperor even unto death. They died on account of faithfulness, not in the hope of future reward.

There is still a small percentage of people in China who take vengeance by resorting to suicide. Under the Manchu rule, official graft prevailed, rich men always had an upper hand in any case in which they were involved, while innocent poor persons were ill-treated, having no money to bribe the officials and so get justice. All that is left for the poor man to do is to die at the door of the rich householder. Before dying, he calculates that his suicide will ruin the rich family; the people hearing the cause of his death, will be aroused to right the wrong; perhaps they will even destroy the building of his rich foe; or the magistrate of the city will extort from the rich man a large amount of money as a bribe, or the latter may be given severe punishment for the death. In any case the rich man is ruined, as the poor innocent man wanted, and thus he has taken full vengeance upon his foe by means of suicide. Another idea of suicide in connection with vengeance is that of haunting. Some people have this conception in mind: "If I am unable to avenge myself upon you while living, I will be able to do so after I become a ghost who is invisible, omnipotent, and can take your life with the consent of the God who has the power over death." This idea has been fostered by novels which are full of stories where a headless man in spirit demands the return of his head before his living foe, a black-faced ghost is ready to take the life of his enemy for whom he committed suicide, and the like. Thus there are a few who attempt to commit suicide thinking that if they die in a place where no one knows but God, the Heavenly Emperor will send his thunderbolt to kill their enemy for whom their lives are sacrificed. The people always want to find out about the life of a man killed by lightning, and would say that that man must have either committed murder, or caused some one to "seek death," when they fail in their effort to find out any scandal. But all these methods for vengeance are waning in popularity, and the people gradually realize that self-destruction will hardly pay for what they desire to accomplish.

But once in a great while a man in a certain locality, commits suicide, because he wants to demonstrate his sincerity in the cause he advocates, or because he desires to extend his cause thruout the whole country. Thus two years ago a Manchu lady, principal of a girls' school, unable to raise enough money for her school, committed suicide, and left a note to tell the tale. She said that by her death, the school could exist, and many men and women would come out to support the institution. In truth, the school received more money than it needed, after the news of her death was published in the newspapers.

In China opium is the most common means of committing suicide, for it is easy to secure, cheap to buy, and easy to swallow. Besides, it has been the superstitious belief of some natives that a man once beheaded, remains a headless ghost. Therefore they prefer a drug which will leave no physical mark on the victim.

Such superstitions as believing in the power of different kinds of ghosts—the white ghost, the hanging ghost, the long-head ghost, and the like—are gradually disappearing from the popular mind of China. The people will no longer believe in suicide as a mode of vengeance, nor as a sign of devotion or loyalty, nor use it as a demonstration of one's sincerity, nor do the poor resort to it in order to ruin the fortune of the rich enemy, for the new republican government gives due justice and equality to every citizen whether poor or rich; education to the ignorant; enlightment to the superstitious; civilization to the whole population. No longer will the coming generation in China believe and act like their forefathers in regard to "seeking death," and in their slight esteem for life, but they will struggle on and on to win victory after victory in the field of intellect, commerce, and morality.

New York City.

Literature

Three Books on Africa

A TRIO of books on Africa is at hand which curiously supplement one another and almost constitute a complete library on the subject. The most general one is *Africa of Today*,[1] by Prof. Joseph King Goodrich, since it is in effect an up to date encyclopedia of Africa, presenting in condensed and readable form such an account of the physical characteristics, ethnology, exploration and modern exploitation of that continent as elsewhere one must gather laboriously. This information is arranged geographically, proceeding, after an excellent historical introduction, from the Mediterranean region, especially Egypt, ancient and modern, southward up the Nile Valley. The development of the Sudan has been so extraordinary and rapid since it came under British sway that one feels the chapter devoted to it a little scanty. The chapters on Eastern and on Western Africa are, however, satisfactorily full, and the latter bristles with facts novel and important. This Atlantic coast seems at last to have jostled itself politically into some sort of settled condition, so that the various European governments which have possessed themselves of pieces of coast and spaces of hinterland have pretty well agreed upon boundaries and have gone to work to cultivate their fields. Railroads and steam river transportation have replaced the old carrier system with startling quickness, and a greater civilization and commerce than most of us imagine is flourishing along the old "Slave Coast." A special chapter is given to the negro peoples, and the book concludes with a consideration of the political relations of the outer world, and especially of the United States, toward this speedily developing continent, and a forecast of what is likely to be the course of its evolution. The author is sure it is to be a "white man's Africa," and is optimistic.

Professor Goodrich seems to have written from full information, altho he confesses he has not been there; and inspires confidence in his general accuracy. The book seems well adapted for school libraries, but will be particularly welcome to any business man interested in African trading or investment, or to the sportsman or traveler who proposes to visit that ever-fascinating part of the globe.

On one topic, however, and that one in which Africa has been most conspicuous of late, if not always, Professor Goodrich's book is silent—the topic, namely, of natural history, especially as to game. Those who miss this information may find the matter fully and admirably covered in Major J. Stephenson-Hamilton's *Animal Life in Africa*[2]. This is altogether the most comprehensive popular account of African vertebrate zoology which has yet appeared in English. It includes the whole continent south of the Sahara (the desert and Mediterranean-border fauna are really European), but is fullest for the natural history of the southeastern plains. Naturally, the broadest treatment is given to those animals interesting to the sportsman and settler—the big game; but fair space is accorded to the birds, reptiles and freshwater fishes. The information is authoritative, admirably exprest and readable; and it is accompanied by many capitally reproduced photographs of wild animals and of hunting scenes. A chapter is appended of detailed advice to hunters or settlers intending to go to Africa, with a digest of game laws, etc.

The third volume of this trio would certainly stand first in the estimation of most readers for interest and perhaps for value, since it exhibits the human phase of Africa, as the European feels it. *A Resident's Wife in Nigeria*[3] is an Eng-

[1] AFRICA OF TODAY. *By Joseph King Goodrich.* 12mo, 314 pages, illustrated. Chicago: A. C. McClurg. $1.50.

[2] ANIMAL LIFE IN AFRICA. *By Major Stevenson-Hamilton.* With a Foreword by Theodore Roosevelt. 8vo, 536 pages, illustrated. New York: E. P. Dutton & Co. $5.

[3] A RESIDENT'S WIFE IN NIGERIA. *By Constance Larymore.* Second Edition, revised, 12mo, 296 pages, illustrated. New York: E. P. Dutton & Co. $1.50.

lishwoman's account of her sojourning and travels in the interior of that West Coast province, where her husband was a magistrate, and it is by no means of the tea-and-toast order. Constance Larymore, the writer, is evidently a wise, capable and cheery woman, and has furnished a wise and cheery book, without a needless paragraph or a dull one. This is higher praise than it looks. It was a rough life, at any rate at first, and adventures and hardships were incessant and sudden; but each was taken with courage and humor, and is sketched upon a background which exhibits—aided by a map—the Nigerian land and people in clearest light. Incidentally one sees the admirable manner in which the trained British agents in such frontiers maintain order and educate the natives in respect for law and industry. It is plain that in this function Mrs. Larymore took a very important if informal part, altho she would have you think that she was entirely concerned with her often sadly interrupted housekeeping and in her plants, butterflies and pets.

Tales of Towered Cities

When books were few, men and women were contented with the simple pleasures of country life. But the spread of reading changed all that. Men with burning words fired the imagination of the toiler on the land, filling his mind with dreams of towered cities and their pleasures. The farmer threw down his hoe, and in the riding clouds beheld the palaces of men. Across the quiet pastures there crept the insidious cry of busy cities, calling with voice that brooked no denial. At evening in the inglenook the farmer boy spelled out the magic message of the printed book bidding him go up to the Town—the cruel, maddening Town. And today it is the same—be we country dweller or city dweller. We teach ourselves to believe that life alone is pulsing in those busy streets where we in fancy follow the characters of our books.

Here, then, is store of city reading for us.

A whistling woman for the town, a crowing hen for the country. And both out of place in nature, say the wiseacres. Mr. Robert Halifax, however, invests the heroine of his *A Whistling Woman*[1] with virtues that delight and have reward. She is a hard-working little London girl, whose lover, a clerk, cannot see marriage on his salary of a pound a week. She, by her stronger nature, keeps him by her side. The suburban life of suburban people is told in a suburban style, plainly and crudely, sparing nothing in the way of drab effects, but lightened by flashes of epigrammatic humor. There is little or no plot, but the characters are full of charm and pathos. It is a slice of life in which the plums of characterization are many. The girl's mother, enacting the comedy of an invalid, with a craving for predigested foods; the barroom bully and orator Casswade, with his dependent Martha; the little Sunday school teacher, with her secret love for the clergyman; the bookmaker barber: they are all vivid notes in this picture of Barking Town.

Lucille Baldwin van Slyke has written one of the most charming collections of stories of city dwellers that we have read for a long time. Her *Eve's Other Children*[2] are the Syrians in Brooklyn, tho we do make the acquaintance of those aliens, Tommee-oo-Breen and Geraldine, the Dutch baker lady's daughter. But our interest centers chiefly in Nazileh, daughter of the East; her mother, Leila, and that wonderful baby, Antar; and the quaint "Ameercan En'leesh," shimmering with Oriental imagery and poetry, is a fascinating accompaniment. There are laughter and tears in those tales of the meeting of East and West. Sometimes we do not know whether to laugh or to cry when we read how Nazileh sought the "magic mare" to save the baby Antar from the bogey "fresh-air fun'"; how she sold her "mashallah" beads that ward off the evil eye to celebrate the coming of Antar's first tooth; how Nejeez Baddour, with the gift of tongues, found the thing called Play. It is a book to read more than once, for it is born of the heart, not the head.

Mr. David Graham Phillips apparently left several unpublished works. We

[1] A Whistling Woman. *By Robert Halifax.* New York: F. A. Stokes Co. $1.25.

[2] Eve's Other Children. *By Lucille Baldwin Van Slyke.* New York: F. A. Stokes Co. $1.

wonder if they had not better been left in the desk, for a more unpleasant book of repulsive people we have seldom read than *The Price She Paid.*[3] New York in this book smells unclean, a city of men with "watering lips of desire"—a phrase we borrow from the author. The story told is that of a girl who makes a loveless marriage with a physically odious wealthy man, leaves him, and struggles to achieve distinction as a singer. She is assisted by two men, one giving her money, the other good advice, and there is not an ounce of humanity in either of them. There is the same shallow psychology, the same lack of discrimination, the same bad taste, which characterize the author's most popular works.

It is a pleasure to note the wholesomeness of an unassuming story by Edward Marshall, which, with no pretension to style, no dabbling in problems, yet has more human nature in it than half a dozen heavier novels. *Bat*[4] is an idyllic story of a young architect's love for the granddaughter of a New York boarding-house keeper. When the grandmother dies he finds himself appointed guardian of the girl, and his manlike blundering and self-sufficiency lead him to cause his ward a good many heartbreaks before he sees things clearly. There are several other characters whose portrayal reveals powers of close observation. Decidedly a pleasant story without banal sentimentality.

Chicago, Detective Burns and Peggy, little mother of waifs and proprietor of a news stand, are woven into the woof of *The Penny Philanthropist,*[5] by Clara E. Laughlin. Irish Peggy is the philanthropist, giving her penny a day in charity, and devoting herself to helping others. Among those whom she aids is a young man, who gets entangled in a dynamite plot against a millionaire. Peggy is able to save him and to have that romance which has hitherto been denied to her. This is a good little story with a moral that is not too preachy, and should sell well at Christmas time.

[3] THE PRICE SHE PAID. *By David Graham Phillips.* New York: D. Appleton & Co. $1.30.
[4] BAT. *By Edward Marshall.* New York: G. W. Dillingham Co. $1.
[5] THE PENNY PHILANTHROPIST. *By Clara E. Laughlin* New York: F. H. Revell Co. $1.

The Supreme Court and the Constitution. By Charles A. Beard. New York: The Macmillan Co. $1.

Professor Beard has given us the fruits of a careful investigation into the question as to whether the "makers of the Constitution" intended the Supreme Court to possess the power of nullifying acts of Congress by declaring them unconstitutional. He has discovered that in one way or another twenty-five members of the Constitutional Convention, including the vast majority of the leaders, committed themselves to the principle of judicial control of legislation or at least regarded it as embodied in the Constitution. On the other side but five members can be quoted. Having thus established his thesis by direct evidence, Professor Beard analyzes the general nature of the Constitution and the class of men who framed it, and finds that, next to establishing a strong central government, the chief aim of the convention was to protect property rights, endangered by radical legislatures in many of the lately freed colonies. His conclusion is not that the judiciary should retain thruout the future the powers first exercised under Chief Justice Marshall, but that the opponents of these powers "cannot rest their case on the intent of the eighteenth century statesmen who framed the Constitution." For a brief and quite impersonal piece of historical research the book is eminently readable and should find a wider audience than that of lawyers and historians alone.

The Port of Hamburg. By Edwin J. Clapp. Pp. xiii, 220. New Haven: Yale University Press. $1.50.

Next to London, Hamburg is the chief center of sea-borne commerce in Europe. Mr. Clapp discusses all the factors which have contributed to its prosperity, such as port facilities, oversea lines, shipbuilders and merchants, and the waterways and railways which have tapped the hinterland. Numerous photographs and maps increase the effectiveness of the text. Mr. Clapp has written with a purpose. He believes that Hamburg offers to Americans important lessons, both as to the modernizing of ocean and lake terminals and as to the development, in connection with them, of river

transportation. "The equipment of the port and the use of that equipment have been made in circumstances similar to our own. Therefore a study of the port of Hamburg has more than the theoretical interest which attaches to the construction and operation of any perfect thing." No attempt is made to apply the lessons to American conditions; but such a careful investigation is bound to have influence whenever the time comes for formulating a program. If Hamburg may be called "a perfect thing," its high efficiency is due not only to natural advantages and the intensity of competition between the five great ports which strive for the central European trade, but also to the energy which Germans are manifesting in every branch of commercial and industrial life. The history of Hamburg is significant of the inevitable expansion of German commerce at the expense of the English. For very good reasons Napoleon called Hamburg "that English city"; as late as 1869, sixty per cent. of the registered tonnage came from England, transshipment taking place at London. But today the English middlemen have been largely thrown off; direct lines ply over all the seven seas. Of course, various influences have helped to bring about this change and the consequent stimulation of German industry; and in describing them Mr. Clapp has presented an informing study of the means by which the empire has achieved its economic eminence.

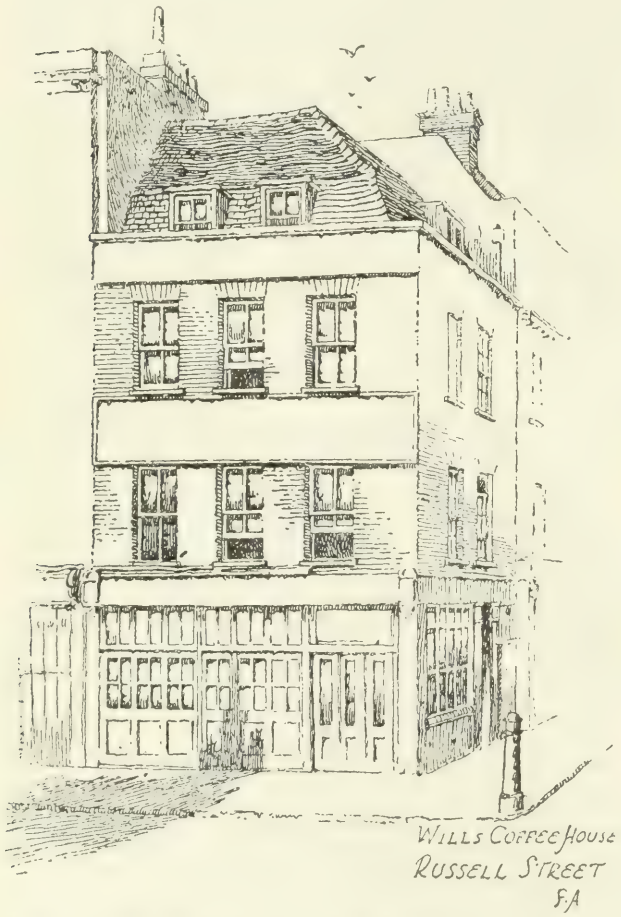
"ACCORDING TO THE NEWSPAPERS HER ENGAGEMENT TO SIR CHARLES WAS EXPECTED"
One of C. D. Gibson's illustrations for Mr. Chambers's new novel

The Streets of Ascalon. By Robert W. Chambers. New York: D. Appleton & Co. $1.40.

Mr. Chambers calls his annual message to New York society for the present year *The Streets of Ascalon*, and it is much above his average work. He takes a clear-eyed boy, just out of college, and finds it unwholesome for him to become a boudoir pet, "always in some fat woman's opera box or in some fat man's yacht or coach," just because he is so delectable a companion with his sunny nature, good heart, and a genius for friendship. We are glad that Mr. Chambers furnishes his hero with a few thoroly nice friends, as well as many unworthy ones. A young widow, who had been disillusionized by two years of a most unhappy marriage, is the means of awakening him to his better and more ambitious self. Other characters crowd the pages and we get the sense of rush and hurry and of futile activity characteristic of the moving multitude in the streets of a modern Philistine city.

Literary Notes

....There is nothing new in *The Voice of the Garden* by George W. Cable (Lane; $1). It is a collection of about 250 of the world's choicest bits of verse and lyrical prose dealing with "the place of spiritual repose."



....Another book for the "tired business man," that is, if he is interested in raising poultry. C. S. Valentine devotes over 400 pages to the subject. If commuters follow the scientific methods they will not miss the 6:37. *The Beginner in Poultry* (Macmillan; $1.50).

....Every one has always known how to play "blindman's buff." Mary Woodhouse gives the rules if you have forgotten them. *Drawing-Room Games and Amusements* may be of some help to a hostess, but only a few of the games are not already indelibly fixed in the mind of every child. (Dutton; 50 cents.)

....A pageant of *Pocahontas* by Marget Ullman is published by the Poet Lore Company, Boston. The ten characters are differentiated by the use of blank verse of varying meters which reads well, but we should reserve our opinion as to its practicability as a play until we have seen it staged.

....One chapter, "The Anatomy of the Foot," lifts William H. Dooley's *A Manual of Shoemaking* out of the class of most trade textbooks. The information contained in the other chapters could be gained, by any intelligent laborer, in six months' factory experience. The book, published by Little, Brown & Co. ($1.50), will be of interest to traveling salesmen who want information concerning the preparation of their goods.

....In *Famous Houses and Literary Shrines of London* A. St. John Adcock writes of the lodgings and mansions of the poets, essayists, painters and novelists of two centuries; also of Shakespeare's London. The American visitor to London will find this a pleasantly rambling volume, full of suggestions; and it is equally a book for the library. There are sixteen portraits and seventeen illustrations in line by Frederich Adcock. (Dutton; pp. 356; $2.50.)

AN ILLUSTRATION BY FREDERICK ADCOCK
From A. St. John Adcock's "Famous Houses and Literary Shrines of London" (Dutton)

....Mr. Mitchell Kennerley's bookshop in Twenty-ninth street, just east of Fifth avenue, has been taken over by Messrs. D. C. Vaughan and L. J. Gomme, who plan to add to its offerings French books and old and rare books. "The Little Book-Shop Around the Corner" is known to discriminating New Yorkers as one of the few places where something like the old-world spirit of the trade persists; where the bibliophile is sure of finding good browsing, good service, and, as often as not, a good look at a good minor poet or two.

....A more optimistic view of conditions and life in American colleges than has been common of late is given by Clayton Sedgwick Cooper in *Why Go To College?* (Century; $1.50). We should not recognize them as the same institutions so harshly condemned by the late Mr. Crane, of Chicago. Mr. Cooper finds the average undergraduate deeply religious, far more temperate than his predecessors and not too much given to athletics. Yet he suggests some deficiencies in our system, particularly the need of great teachers and inspiring personalities in the faculty. The volume is attractively illustrated with drawings and etchings.

....*A Half Century Among the Siamese and the Lao.* By Dr Daniel McGilvary. With illustrations. New York: Fleming H. Revell Co. $2. This interesting and instructive volume contains Dr. McGilvary's life as a missionary for half a century in the "land of white elephants." The author tells of his self-sacrifice and strenuous service in saving the natives from such powers of darkness as witchcraft, fever and famine by introducing quinine and vaccination among the people afflicted by malaria and smallpox. Besides this, he founded educational institutions for little Siamese boys and girls. Dr. McGilvary understands the Siamese and the Lao thru and thru, and his book records the true character of the people.

....*The Birds of God,* by Theron Brown. Decorated cloth, 12mo, 318 pages, colored illustrations. Boston: American Humane Education Society. $1. Here is what its compiler styles "a portfolio of anecdotes" showing "parallels of man in the feathered creation." He confesses that he does not know whether his anecdotes are true or not, but declares that this does not much matter anyway—what he cares for is the "lesson." The stories are, in fact, merely a lot of unverified clippings from Sunday school journals and newspaper corners, nine-tenths of them absurdly erroneous in fact and foolish in sentiment, and the other tenth doubtful or badly exprest. Yet this mess is offered as "materials" for teachers and preachers, who are expected to base

messages alleged to be of divine truth upon tales about birds (no more peculiarly God's creatures, by the way, than spiders or crocodiles) which the smallest critical intelligence would reject

....From Paris comes the second volume of Ferdinand Brunetière's *Histoire de la Littérature Française Classique,* treating of the seventeenth century (Ch. Delagrave; pp. 652; 7 francs 50). The first volume—*De Marot à Montaigne*—appeared several years ago: soon after the death of the great critic. Now, the seventeenth century was, peculiarly, Brunetière's own; and tho his history of its literature was left uncompleted, we are glad that one of his pupils, M. Chérel, has, from Brunetière's outlines, and from the notes of students of the Ecole normale supérieure, prepared what is (in M. Doumic's words) a work that contains all the materials, at least, and faithfully reproduces the general lines of the monument which the master planned. At least one more volume is projected by the publishers.

....It is a tragedy of letters that Brunetière did not live to execute for himself the work in which his friends and pupils have collaborated in this *Dix-Septième Siècle.* Here he found that principle of authority which, in his philosophy, was the essential; here he found his own style. But it is remarkable that a work performed under the conditions of the one before us should have proved so excellent as is this: which bears witness in a high degree to Brunetière the teacher. The method applied to the century of Louis XIV is precisely that used by the "naturalistic" critic in other fields. Evolution—objectivity—erudition: here are the key words. It is Pascal whom Brunetière considers the greatest seventeenth century name—tho Racine is of course the most perfect in form of all the writers of his century. Why is this volume not indexed? Doubtless we must await the final volume of the work for that essential convenience.

....Brunetière is himself the subject of a telling paragraph in Georges Pellisier's new essay in criticism, *Le Réalisme du Romantisme* (Paris: Hachette; 3 francs 50). "After Taine," writes M. Pellisier,

"Ferdinand Brunetière, anxious to apply a method in accord with recent progress in the natural sciences, wished to be a disciple of Darwin and Haeckel. However, by the characteristic traits of his mind he belonged to the same family as Taine; he, too, is a doctrinaire. Besides, when he set up his evolutionary method, his doctrine was already long established; assuredly it is rooted in reason (being essentially classical): reason that is universal and eternal. . . . His method is not itself 'realistic.' . . . From the moment he practises it, . . . it leads toward abstraction."

SIR—Why not use your valuable Finial of Public Utility to put third party applicants thru their entrance exams? As, for instance:

(a) Define the irritative and neverendum.

(b) Do you believe in direct primaries, or do you think the women should propose?

(c) What is the difference between a Republican?

(d) Do you prefer Theodore Roosevelt or moving pictures?

(e) Which is the harder on the eyes?

(f) Who would you rather be: 1. If you were President Taft? 2. It the high cost of living would let you?

(g) Suppose you were putting on your shoes, and you got one foot up and found you had the wrong shoe for it, would you put up the other foot? Or reach the other shoe? Or both?

This last is a Munsterberg test for political defectives. The answer indicates the degree of the applicant's progressivism. Try it yourself.—*New York Mail.*

The Independent

Entered at New York Post Office as Second Class Matter
Publisher, Clarence W. Bowen
130 Fulton Street - - - - New York

A WEEKLY MAGAZINE FOUNDED IN 1848
One Year, $3.00 Single Copies, 10 Cents

Single copies over six months old, 25 cents. Postage to any foreign country in the Universal Postal Union, $1.75 a year extra; to Canada, $1.00 extra. Subscriptions will be received for other periodicals, and clubbing rates will be granted as low as those offered by any responsible agency.

An order for the change of an address should be received two weeks before the change is to take effect. The old as well as the new address should be given.

For the convenience of our subscribers we will send on receipt of the publisher's price any book reviewed or advertised in our columns.

Volumes of The Independent are completed at the end of December and June, and a full index is furnished free on application. Neat binders holding in book form thirteen current issues will be furnished for 45 cents.

If the numbers comprising any semi-annual volume are returned to us prepaid in good condition with $1.50 we will bind the volume in handsome and substantial half buckram and deliver it free anywhere in the United States.

We are always glad to receive articles for examination, but writers desiring the return of their manuscripts, if not accepted, should send a stamped and addressed envelope. Even so, we cannot hold ourselves responsible for their return. Authors should preserve copies of their manuscripts.

Advertising rates will be furnished on application.

Indian Summer

INDIAN summer used to be an afterthought, a little kodak glimpse of June; it is now a compensation for the genuine summer. April has a habit of impinging on May, and frequently on June, leaving July and August doubly hot, as if they were doubled over on each other. September and October are the only really comfortable parts of the year, and they are not unfretted by frosts. Indeed Indian summer has become a necessity, a compensation for the June which used to be. Crowded out of the middle of the year it is dropped into November.

If one could only know just when Indian summer is come, it should become a national jubilee; a two weeks' festival, and Thanksgiving Day might be placed just at the end of it. But it has a habit of coming when it pleases, and lasting, one never knows just how long.

Indian summer is pretty sure to find a lot of corn to husk, and some of the best apples still hanging on the trees. We will leave the Winesaps and Seek-no-furthers, until the last, and that is to make sure that the flavor has got into them. That is the trick with some apples, that they are picked too early and have not quite enough sunshine in them. Wait for these Indian summer days, about the first of November, and the work will be done; but do not wait for the very last day.

For sure as the zodiac there will be a sudden snap-off, and it will come after a luscious day, where there have been belated sweet peas in blossom and string-beans for dinner. The cars that roll in from the west will have snow on the roofs, and the black sky will spread over from the north and a howl will rend the peace, for winter is coming.

If you have a little forethought to throw down a few poles of beans in October, and to cover a plat of nasturtiums, you can have fresh flowers and fresh vegetables, and so the summer conceit will be complete. Kick aside the grass under your Seckel trees, and you will find enough of the delicious little pears to fill your pockets. Grand Duke plums are still purpling on the limbs, and as rich as the Fellenburgs of October. Possibly a few belated strawberries can be found in the garden rows.

Do not fail to get into the beechwoods just now for an afternoon, if indeed a few beech trees still remain near you, and smell the wonderful brown leaves. Perhaps you are not yet too old to enjoy picking up beechnuts while the squirrels scold and would drive you away. The editor prefers to kick his feet thru the dry leaves, or throw himself into a pile on the bank of a brook.

Ah, that dear old brook; it has been going on in this way ever since we were boys and girls that jumped over it when we went blackberrying. It still has the same pleasant ways of laughing and gurgling and carrying leaves down from the wood lot into the meadows. Where did it get its water; where did it learn its songs; and when will it ever get tired enough to stop? What a blessed thing it is that Nature never gets tired. It has gone thru the same old round—a moving picture show—these hundreds of thousands of years, and will go on much the same after we are gone. But the wonder of it is the variety she manages to

work in year by year. Dear old folk! she seems to be saying; my sixty and seventy year old children! I have you always in mind. I never made two Indian summers alike. There is always the unexpected, and I do not forget that, as you get older, you will want all the more "something else."

It is this craving for change that fits us so well to the world we occupy. The father comes in saying, "The Burgamot pears lack flavor this year, mother," and she answers, "We should have thinned them when half grown." "To be sure, little mother, and next time we will not forget." Now with bags over our shoulders we search for butternuts; but the squirrels laugh at us, from their holes half way up the trees. Yes, yes, there are no butternuts this year. That is why they will be so good next year. That is the way of it. Nature knows how to manage it, and while she gives us enough, she never gives us the same basketful.

There is nothing like it, this Indian summer. It is all other good times crowded into one. It is not exactly May, for May was all going ahead, a restless month, of growth, and then more growth. Nor is it quite June, when the berries and roses set the tune. Nor is it July and August, when the quiet fields smiled with golden wheat, and the corn grew all night for fear it would not be ripe in time. The hard work is over with. There is the smile of May, and the warmth of June, and the sweet peace of August. Nature moves quietly about with a notebook, to sum it all up. Wild grapes hang from the elms, and the huskers have stained their mouths, while they toss the ears into golden piles.

Oriental Worship of the Dead

THE death of Mutsuhito, Emperor of Japan, and the almost divine honors given him at his burial, call attention to the nature of that worship of ancestors, and particularly of Confucius among the Chinese, and of the Emperors of Japan, which constitutes so large a part of Oriental religion. There was nothing like it among the ancient Hebrews, while in Egypt the worship of Osiris had much of this nature; and among the old Babylonians a great king was soon after his death given divine honor. Equally the designation *divus* was given to deceased Roman Emperors, and some of them hastened to anticipate that distinction during life. It has been a serious question with the native Christians of China how far it is right for them to join in the required adoration of the spirit of Confucius, and with those of Japan as to the worship of the deceased Emperors. Is it a real worship of prayer, such as should be given to God only, or is it such as Catholics give to saints, or is it only such as we ask our children to give when they salute the flag? The services in honor of Mutsuhito may shed some light.

The Japanese papers give us the prayers read on the occasion of the state funeral of the Emperor. We have already quoted the dirges sung, and we now give the prayers.

The officer in general charge of the services offered this prayer, at least that is what he called it:

"I, Takatsukasa Hiromichi, of the Second Senior Grade, Third Order of Merit, Chief Ritualist, with awe and reverence offer a prayer in the presence of His August Majesty, the Meiji Tenno, whose mortal remains now rest for a brief space in this Hall.

"His Majesty's glory shines both inside and outside the realm to the furthest extremities of the globe. His Majesty's people have enjoyed his fathomless benevolences and wished for the endless continuance of his reign, but His Majesty was suddenly taken by illness and ascended to the Heavens, whereupon the whole country was thrown into an abyss of wonderment, sorrow and grief. Especially great was the grief that overwhelmed the Imperial Palace, where the mourning continued day and night. Deep homage was paid to the late Emperor during the lying in state, and there being nothing more to be done in the present world, on this very day the funeral ceremony has been performed preparatory to burying the remains deep and secure in the adamantine rocks of Momoyama in Fushimi, Yamashiro.

"For that purpose His Imperial Majesty stands here in this Ceremonial Hall and personally prays with offerings of silk brocades and food and *sake* and sundry other things. Let the spirit of His departed Majesty hearken in peace and gratification to this prayer, that His Majesty may start on his long journey without mishap."

This is not exactly what we would call a prayer. It is rather a historical statement, with the expression of the most profound honor in which the late Em-

peror was held, and the hope that his spirit will hear and accept these dutiful expressions of respect. Now let us hear the more important "prayer" of his son, the new Emperor:

"I, the Emperor Hirohito, reverently declare in the presence of His Majesty, my late father, that since his accession to the Heavens, day and night I have had his gentle features in mind. I have made offerings and worshipped in the Death Chamber and in the Chamber of Lying in State for forty days to no avail, and have now come to this place escorting the funeral car previous to burying the remains at Momoyama.

"When his late Majesty departed, the whole people, high and low, prayed to the Heavens and Earth, and now that the funeral is to be performed the whole nation is sunk in deep sorrow—a manifestation of the nation's loyal feeling engendered by His Majesty's beneficent rule. When I think of these things I am sunk in still deeper sorrow."

There is in all this nothing that we should call prayer, in the sense of petition for aid or comfort, or future guidance or benefit. But there is the mention of prayers by the whole people to the Heavens and Earth, following the Emperor's death, but whether of adoration or petition we are not told.

It would seem that the "worship," or whatever it might be called, of the Japanese Emperor can, at least in the present case, be interpreted easily as having in it nothing pagan or inconsistent with Christian faith. At the same time it is certain that the revolution of thought which has taken place in Japan during the reign of the late Emperor has tended to modify the deification of Emperors past and present; and the language of these "prayers" may be affected by such change. We do not see why the foreign Christian princes and Secretary Knox, who attended the funeral, could not have consistently and worshipfully taken part as Christians in the ceremonies. This is a subject of very great importance to the young Christian Church in Japan, and still more to the Christian schools in China, where the periodical "worship" of Confucius is required. While this is commanded, the teachings of Confucius and of the classics generally are now generally dropt in the schools, and the bowings before his image will be made more and more perfunctory. The new China, like the new Japan, will discard the old religions. The danger is that they will be atheistic.

Sweetness and Light

It is a great satisfaction to recognize efforts to promote the welfare of the men who do the hard work of the world, even tho those efforts may seem to be a sort of refined selfishness intended to increase the efficiency of labor for the ultimate advantage of capital. A bright example of social regard for workers is seen in the Territory of Hawaii, on one sugar plantation at least. It is said that that industry, which produces 550,000 tons of sugar annually, is permeated by the wise and humane spirit diffused thruout the islands by the early missionaries, but modern scientific social endeavor is far from being universal even there. Apparently there is no reason, except the lack of such a spirit, why all the sugar plantations should not be conducted on the lines of this model one on the surf-beaten shores of Oahu.

A tract of 3,000 acres, 2,500 of it in sugar cane, gives ample opportunity, among the six or seven hundred employees of ten different nationalities, to carry on sociological experiments in connection with the process of sugar-making: the diffusion of light along with the production of sweetness. So far as possible, the laborers are married when employed. Thus, with about 150 Japanese men there are 110 Japanese women in the field. Each nationality has its own camp, the unmarried men in barracks, the married couples each in a little house of two or three rooms, with ample space for a garden, where the generous climate gives them flowers and vegetables in profusion in return for modest exertion.

Six days in the week a well-ordered crêche receives, bathes and feeds the little children whose mothers share the lighter labors of the field with their husbands. Well cared for, the babies, after a joyous day, return to their mothers at night to be welcomed with unfeigned happiness after the hours of separation. For the older children there are excellent day schools, best and most important of all, an agricultural department where for the four morning hours they are trained in such work as their parents are doing and which promises most for their own future, an independent rural life. To encourage the children, they are not only taught the secrets of raising

sugar cane and other growing things, to fight insect pests and weeds, to raise fowls and other creatures, but as fast as they prove their efficiency by doing things well, they are paid a small sum of money. This school is comparatively recent, but it has already proved that the ability to use the hands helps to develop the ability to use books and the subjects connected therewith more intelligently and seriously.

For the girls and women there is instruction in branches essentially feminine—cooking, needlework, the care of the family and the home. The men and boys have athletic clubs, games, reading rooms and similar provision for leisure hours, which come to them in spite of their constant occupation in the beautiful sugarcane fields.

In case of sickness there is an admirably equipt hospital, with the best modern appliances and skilled physicians, where without money and without price the injured or ill workman or woman may be cared for wisely and tenderly. The cost of all these things is large, undoubtedly, but after all, why should not employers consider that educational expenses are as justifiable as charges for machinery? Is moral machinery less necessary and valuable than that of steel and concrete? Why spend tens of thousands of dollars for irrigation of the cane and leave the minds and hearts of the men who do the work as barren and dry as the unwatered volcanic soil? These are the questions that the sugar planters themselves are beginning to ask. It seems a good omen to those who still remember the old sugar plantation days of the South, and the time when the chief beauty of the waving cane brakes was that they afforded such safe hiding places for the harassed slaves. Compare their chances for life and freedom with those of the worker in Oahu!

What is the result thus far of this one experiment? In the first place, there is more continuity of service—hence more efficiency. The man who has his family, his little home, his bit of ground, the chance for his children to learn something useful, is far less restless than the ordinary laborer. On this particular plantation are men who have been working there eighteen years, an almost unheard of time in a semi-tropical climate.

Even more important is the harmony that exists. That ten nationalities, who in many sections sadly ruffle each other, jealous of supposed preferences, should live together in peace is a striking fact. It is because they are treated with equal courtesy and justice. It is evident to them that the manager, while never losing his sense of responsibility to the concern which is raising sugar, feels an even greater responsibility for the human element that enters into its manufactory. The manager himself has found that these people must be treated as individuals. The mistake is too often made of dumping laborers into a common pot and expecting good results. Each man, he declares, must be treated as an individual, with absolute justice and truth. If an ignorant workman thinks he has a grievance and can come to his "boss," knowing that he will find a willing ear to listen to his tale of wo, and that he will be kindly and justly treated, the grievance dissolves almost in the telling. The man is suddenly imprest with the idea that the boss looks on him as a free individual and not as a slave. He is not encouraged by any dole of false charity; he is not encouraged to malinger, but he learns to realize that if he does his work well he is worthy of his hire, and that something besides money is included in his "hire"; a chance to be a man as well as a "hand."

The religious life of this complex community is not neglected. A Buddhist temple, furnished complete from Japan, a Roman Catholic chapel and a little Protestant meeting house, minister to the different races and creeds, thru the aid of sympathetic priests and clergymen, the results of which must be helpful.

As for the agricultural school, it will take some years yet to demonstrate its full value, but already it is easy to prophesy that five years hence the boys and girls now attending it will have proved that in learning how to till the soil they have acquired an education that "stimulates the imagination, trains the hand and eye, increases self-respect and enhances the market value of their own labor."

The Way of Syndicalism

We have in a previous issue described the principles of Syndicalism as it is proclaimed; we propose here to give briefly its theory and practice in this country as we learn it from its unabashed teachers. We depend on "Syndicalism," a lurid red pamphlet by Earl C. Ford and William Z. Foster, secretary of the Syndicalist League of North America, and the *Internationalist Socialist Review,* which represents the International Workers of the World, known as I. W. W., who are frankly Syndicalists, and who have made the late trouble in Lawrence, led by Mr. Haywood. We notice that the cover of this review is of pure, innocent white except as Candidate Debs's face fills it, while the new Catholic anti-socialist magazine, *The Common Cause,* is of the most blazing Anarchist red. We give quotations from "Syndicalism." This of scabs:

"A poverty-stricken workingman, in his predicament, can do anything save *scab.* He may beg, borrow, steal, starve, or commit suicide, and still retain the friendship and esteem of his fellow workers; but let him take the place of a striker and he immediately outlaws himself. He becomes so much vermin, to be ruthlessly exterminated."

That means murder. We are told approvingly of the French Syndicalists: "They literally hunt scabs as they do wild animals." Compared with this Syndicalism's other weapon, sabotage, is innocent, but sabotage is claimed to be the more effective and the less dangerous. The workman who uses it does not strike; he simply remains at work to do all the hurt he can by spoiling the products and injuring machinery. Says an authority of the Syndicalist:

"He allows no consideration of 'legality,' 'religion,' 'patriotism,' 'honor,' 'duty,' etc., to stand in the way of his adoption of effective tactics."

The end justifies the means.

Mr. Foster tells us that since its organization in 1905 the I. W. W. "has progressed far toward Syndicalism by the rejection of political action and the adoption of 'direct action' tactics"; that is, of violence and sabotage. Every one knows that this is a fact; and the question is whether Syndicalism will capture the labor movement generally in the United States, and the Socialist party, as in France.

Now we return to the *International Socialist Review.* Observe that it is Socialist—it supports Debs for President. It is also the organ of the I. W. W., as its name *International* indicates. Also it will be discovered that it is thoroly Syndicalist. William D. Haywood is one of its associate editors.

The leading article in the October number is by Edward D. Kintzler, Socialist candidate for State Auditor of West Virginia, and it tells the story of the present coal strike. The mines had been patrolled by "mine guards," who are held in the greatest abhorrence, and described as "assassins, brutes in human guise, traitors, rapists, the lowest form of man." The miners wanted a good chance to kill them. The story is gleefully narrated. They secured guns, ambushed the guard house by night, started loaded coal cars down an incline. We quote:

"This was the signal for the battle. A few of the mine guards who rushed out to learn the cause of the damage moistened the dusty platform with their blood. Any light was the target for the miners who had gone behind boulders and trees on the hillside where they were comparatively safe while shooting."

The battle raged two days, till the Governor sent the militia. There is trouble brewing in the November election. S. W. Houston, secretary of the Socialist party, is candidate for prosecuting attorney in Kanawha County. We quote further:

"Watchers will be stationed at the polls. If any treachery is detected a signal will bring an armed force of miners to demand their rights in no uncertain terms. They are prepared to carry the election and secure the political powers of the county in which the State capital is situated."

William S. Towne tells the story of a sudden street car strike in Duluth:

"Cars were derailed, scabs were shown the error of their ways, and the fear of God was put in their hearts. . . This strike, mark you, may be won, not by strikers, but by the 'direct action' of 5,000 sympathizers."

That is, the strikers will themselves keep quiet, and their sympathizers will attend to the violence.

It is of no use for us to cover our eyes and go it blind, wilfully refusing to see the glaring facts. There is—and it is

our business to know it—a faction in federated labor that is trying with an eager passion, which would be religious if it were not demoniac, to capture all federated labor and all Socialism to the methods of merciless violence, murder and ruin, with the purpose of overthrowing and then usurping all government. It will not do it by peaceful tactics, educational or political, but by "direct action," allowing "no consideration of legality, religion, patriotism, duty, to stand in the way of the adoption of effective tactics." It blankly defends and practises what we hang people for. Murderers are its martyrs. Men who refuse to go on strike, or who take the place of strikers, are "vermin," to be "exterminated." This is not anarchism, but worse than anarchism. It is the reign of terror in place of the reign of law. It is not the rule of the people, but of the "militant minority," the aristocracy of assassins. It is trying, really hoping, to capture labor. But we do not believe this possible. The great body of federated labor hates Syndicalism. If one wants to be happily assured of this let him read the reports of the demonstration against the I. W. W. and its Syndicalistic tactics at Lawrence on Columbus Day, when 25,000 marched in line thru the streets, each carrying the United States flag, while scarce 500 attended the rival Socialist—there a Syndicalist—I. W. W. picnic.

The Four Kingdoms

THE Balkan states have stolen a march on the Powers by getting up a concert of their own and mobilizing against their common foe. The outside world is surprised and puzzled; surprised that the four rival and discordant kingdoms should have been able to come to an agreement so suddenly and secretly; puzzled to comprehend how far that agreement extends. Is the quadruple combine an alliance, *entente,* federation, confederation, pool, gentlemen's understanding, trust, holding company or some other sort of arrangement new to political and financial circles? Was the gun fired by Prince Peter of Montenegro at the Turkish fort on Mount Planinitza at 5 o'clock Wednesday morning, October 9, part of the prearranged program of the attack on Turkey? Or did Montenegro precipitate the conflict by acting on her own initiative? Or did King Victor Emmanuel of Italy instigate his father-in-law, King Nicholas, to the attack in order to force Turkey to consent to the cession of Tripoli? Perhaps we shall know next week. Perhaps the secret will be kept until some youthful aspirant for a Ph. D. in history digs it out of chancellery letter files fifty years from now and publishes to an indifferent world at his own expense the information that any newspaper, capitalist or foreign secretary would now give a fortune to know.

It is easy to see why the four kingdoms should be willing to make a simultaneous raid upon the Ottoman Empire, but hard to understand how they could have come to an agreement as to the division of the spoils in case of success. The cause of their present harmony must later, it seems, become a reason for their discord. They all want to free Macedonia—and annex it. What is more, they all can establish their several claims to it, in the customary way, by an appeal to history.

Let us consider first the dominant partner in the new Balkan firm, Bulgaria. The schools established by the Bulgarian Government since its independence in 1838 have been assiduously cultivating the spirit of patriotism and imperialism. Since Macedonia by definition belongs to Bulgaria, all its ancient glories belong also to Bulgaria. This is what the boy Bulgar reads in his history book:

> "The most celebrated sovereigns of Bulgarian nationality in antiquity were the Czar Philip and the Czar Alexander the Great. These, after having conquered the whole of the Greek territories, extended the Bulgarian empire as far as India."

Whether the present Czar Ferdinand, self-styled so since October 5, 1908, aspires to Persia and Egypt by virtue of his inheritance from his illustrious predecessor, the great Czar Alexander, does not yet appear, but he doubtless has ambitions, even hopes, of extending the kingdom at least to the limits allowed to it by Russia after the conquest of Turkey. According to the treaty of San Stefano before it was revised by the Congress of Berlin, the principality of Bulgaria reached from the Danube to the Ægean, including most of Macedonia, and leaving to Turkey two detached territories, Albania to the west and the Con-

stantinople country to the east. This indeed was not so great as the Bulgarian kingdom at the time of the First Crusade, for then it reached to the Adriatic.

But in 1885, the last time when young Bulgaria attempted to expand to the limits of Old Bulgaria, it was attacked by Servia, which also has aspirations in the same direction. The Servians were promptly defeated, and the Bulgarian army was well on its way to Belgrade when it was stopped by Austria with the command: "As you were!" Now the imperialistic dreams of Servia revert to the fourteenth century, when Stephen Dushan ruled over an empire stretching from the Danube to the Gulf of Corinth and from the Adriatic to the Ægean Sea, embracing Bosnia, Albania and Macedonia. But on the fatal field of Kossovo in 1389 the Servians were overcome by the Turks and remained in subservience for five hundred years until Black George, the cowboy, rose and freed his country from the Moslem yoke. Peter Karageorgevich, now King of Servia, is the grandson of Black George.

But tho the Servian empire fell, not all the Servians were conquered. One band of patriots took shelter in the dense forests of the Black Mountains. There they defied the Turk in the hight of his power and now in the days of his decline they return to the valleys for their revenge. The Montenegrins are beginning to adopt the conventionalized clothing of the civilized world, but there is one part of their picturesque national costume that they refuse to discard, their caps of red cloth, encircled by a black band and adorned with five gold stripes; red for Kossovo, black in mourning for lost Servia, the gold stripes for the five centuries during which they alone of all the Balkan peoples have maintained their independence. It is poetic justice that this saved remnant should lead in this war for the liberation of those that still remain under Ottoman domination.

Variations in Temperature

One of the most interesting biological facts in human phenomena is the maintenance of the bodily temperature at a definite level in spite of external conditions. In the summer time, with the average temperature above 70° F., but with many days on which, in tropical climates at least, it rises even above 100°, the human temperature remains at an average of 98.4. In the winter time, with the average external temperature well below 50°, and with many days in severer climates below zero, human temperature is maintained at the same 98.4° with but slight cyclic daily variations. Whether it be in Central Africa, under a direct sun of 120°, or at the North Pole, with the mercury in the thermometer frozen and the temperature perhaps 70° below zero, there is no variation in human temperature unless there is some serious illness at work. Fever runs the temperature up, collapse runs the temperature down, but there is a definite tendency in each case for restoration to the normal, and if health is recovered that is what actually happens.

Almost needless to say, such a maintenance of a definite temperature in spite of conditions that would seem surely bound to disturb it can only be secured by the nicest kind of adjustment of the mechanisms of heat accumulation and heat dissipation. Nearly always nature must make arrangements for heat accumulation, for the external temperature is generally below that of the normal level of human temperature. On the other hand, those external conditions may go very much above normal human temperature without producing serious results. Men can work, for instance, in a glass foundry or in steel mills at a temperature for hours around 120°. The stokers in a large steamer may work for hours at even 130° to 140°. The evaporation of perspiration brings down their body temperature so that it does not rise above normal in spite of these untoward external conditions. Men have been able to remain for a considerable period in ovens with the heat above even 200°, where meat might be cooked and baking done, and yet their temperatures not rise, provided their heat dissipation was good. Under such circumstances they could not touch any metal or solid object of any kind without being burned yet their temperature did not rise materially above the normal.

In spite of this definite power to maintain temperature at an even level it has been found that living in a perfectly equable temperature is not conducive to

the health of man. It might be expected that, if conditions could be found in which there were but very slight variations of temperature from season to season and from time to time during the day, they would be particularly beneficial to man and enable him to store up much more energy to apply to other things, since it did not have to be consumed in the regulation of temperature. Like so many other things that seem at first sight beneficial, any such equability of temperature in living conditions rather weakens than strengthens man, and. above all, fails to supply him with extra energy. The climatic ideal would seem to be to live at a temperature of about 98°, so as to be under the necessity of consuming very little heat-giving material or using up calories simply in maintaining the temperature. As every one knows, that temperature would be almost absolutely fatal to continuous effort of any kind, and as a rule we do not expect accomplishment from men who live under such conditions—and we do not get it—unless they have accumulated incentive while living in a more stimulating climate.

Even for the ailing it has been found that a perfectly equable climate is not conducive to the regaining of health. Lauder Brunton in England called attention to the fact that no climate with an average variation during each day of less than 30° seems to be beneficial for consumption. The stimulus of such variation seems to be the best possible tonic for patients, or at least in its absence they do not get on nearly so well and curative reactions are not nearly so likely to be awakened. They may have fewer symptoms for a time in the more equable climate, but recovery does not take place or is delayed, and, above all, that gain in appetite and weight which is so important for the tuberculous does not take place. Indeed, it is often said now that, while elevation is good for consumptives, the reason why it is so favorable is not entirely the rarefaction of the air and the consequent deeper breathing required, which brings all the lungs into play, but there are other very important factors. Mountain climates are usually dryer and consequently there is less irritation of the lungs by damp air; they are always less dusty and therefore less trying in this way; but more important than any of these is the daily variation of temperature, which is always marked in mountainous countries and sometimes runs above 40° of difference during the twenty-four hours. This is the tonic stimulant of altitudes which proves so beneficial to so many tuberculous patients.

What is good for the ailing is even better for the well. In recent years this principle of therapeusis has come to be recognized very generally. It was thru the benefit obtained by the tuberculous that we learned the value of outdoor sleeping and of the maintenance of weight for hight and of many other maxims of health. From its effect on them we learn the value of variations of temperature as stimulants to natural processes and to human vitality. There is a definite feeling on the part of a great many people that our climate, with its large variations, cannot be particularly favorable to health. Many people envy the good fortune that some few enjoy of being able to live in an equable climate in the Southwest, or of being able to escape the rigors of the winter in the South. It is probable, however, that the dweller in the ruder clime, where large variations of temperature occur, gets more out of life, and, above all, develops more energy for work and more resistive vitality for health than those who live under more equable conditions. There is some consolation in this thought, at least for those of us whose conditions of life require that our work shall be done in this disturbed Eastern climate of what is called the Temperate Zone, tho so many of us are likely to find it intemperate in its variability.

Caloric

THERE are cycles of fashion in the forms of thought as well as in the forms of furniture and dress. Just as the housewife rummages the garret to find old clocks and spinning-wheels for her parlor, and put trails and paniers on her new dress after having long rejoiced in the freedom of light, short skirts, so the man of science often returns to the ideas of a former generation and furbishes up antiquated and discarded hypotheses to use in his latest laboratory. Whatever may be said of the fashions in furniture

and dress, there is usually a good reason in the case of science for this reversion to an earlier mode of thinking, and this is because the later conception, tho it may be better than the old, is found likewise to fall short of the perfect requirement of telling "the truth, the whole truth and nothing but the truth" about the phenomena it is designed to explain. When this is realized the mind reverts to the older notion and it is sometimes found that this is not altogether unreasonable, as was supposed at the time when it was discarded, but contains some germ of truth, perhaps not so well exprest in the more modern conception.

A striking illustration of this philosophical atavism was shown by the recent Dundee meeting of the British Association for the Advancement of Science, when Professor Callendar, president of the section of physics, devoted his opening address to the advocacy of a revival of the theory that heat is a material substance instead of a mere form of energy, a theory that we of the laity thought dead and buried along with phlogiston, the philosopher's stone and perpetual motion. In fact, we Americans had been taking pride in thinking that it was an American, altho a Tory traitor, who gave the death blow to the old substance theory of heat, Benjamin Thompson, of Salem, Mass., later Count Rumford of the Holy Roman Empire. While boring cannon for the Bavarian Government, he was struck by the immense amount of heat developed by the friction and came to the conclusion that one could not call that ordinary matter which could be obtained in unlimited quantity from a single block of bronze. He rightly reasoned that the heat must in some way have come from the work done by the horses in turning the cannon and he determined with quite remarkable accuracy the numerical relation between the horse-power expended and the heat evolved, thus establishing one of the most useful of the constants of nature, the mechanical equivalent of heat.

The objection to the material theory that thru friction or incandescence a continuous flow of heat may be produced indefinitely Professor Callendar gets around by resorting to the ether, that bank of unlimited credit upon which all scientists feel entitled to draw checks *ad libitum*. He conceives of the ether, not as a solid denser than platinum, but as having a grained or molecular structure, and from this and perhaps from the inside of the atoms too the corpuscles of caloric get dislodged by violent action, and then the body, as we say, gives off heat. These heat corpuscles he suggests may be like the electrons or corpuscles of electricity, but neutral, each consisting of a positive and a negative electron hitched together. If they possess weight it must be exceedingly small, since the most careful experiments have never been able to distinguish any difference in weight between a hot and a cold body.

This new old idea that caloric is an indestructible form of matter, the carrier of energy, not energy itself, is certainly revolutionary, but is quite in line with the tendency of the times to extend the atomic theory into the field of energetics. A ray of light is nowadays regarded by many physicists as having a granular structure instead of being a continuous wave. A few years ago we used to think of the electric current as merely a flow of energy along the wire, or even as a transmitted strain in the surrounding ether. Now it is the fashion to look upon the electric current as a veritable stream of corpuscles running thru the wire like water in a pipe. But heat also is carried along a wire in much the same way as electricity. A metal that is a good conductor for the one is a good conductor for the other. So if we think of the electric current as composed of minute material particles, it is natural to think of heat in the same way, as an allotropic form of electricity, if we may be allowed the expression. The aim of science is to promote easy thinking on hard subjects, and scientists are always ready to adopt whatever conceptions prove most convenient.

Taft or Wilson

A correspondent from Washington who is no politician is not satisfied that we are emphatic enough in our support of Mr. Taft and our opposition to the success of the Democratic party. President Taft, he reminds us, is characteristically the advocate of scientific ideas in legislation. He wants a tariff based on thoro investigation of cost of

manufacture at home and abroad, a river and harbor bill free from logrolling, reciprocity with Canada, the widest possible arbitration, civil service on merit thruout, and the retirement system demanded for its complete establishment. For all these things THE INDEPENDENT has repeatedly supported Mr. Taft. On the other side our correspondent asks:

> Why do you not call attention to the fact that nine-tenths of the lynchings in the United States occur in Wilson's sure States, and that the practice is there upheld by public sentiment; that the social ideal of these States is of a higher and a lower caste; that if Mr. Wilson carries out his progressive ideas it will be in spite of the Southern element in his party and by the aid of non-Democratic allies, that if the Democratic party gets into power there will likely be a Jim Crow law enacted for the Capital city?

To this aspect of the political issue we have given clear expression more than once. A conclusive objection to the success of the Democratic party is the fact that its controlling support comes from a public sentiment opposed to free and equal democracy and pledged to caste aristocracy, to conservatism of the worst sort.

Arid and Swamp Lands

Reclamation of arid and swamp lands is a part of the program for restoring the balance of prices, that is, the normal relation between food and the people. Of course, promoters take advantage of the efforts of the Government and the States, and there is an enormous amount of fraud and suffering as a consequence. It remains, however, as a fact, that the vast Everglades of Florida, at present only the home of alligators, will become within fifty years one of the most fertile gardens of the world. Those who desire to settle in such sections should be almost immune to malaria and insects, and the preliminary work will have to be carried on for at least half a century before wholesome homesteads will cover the area. In Wyoming, Montana, California, New Mexico and elsewhere the Government appropriations are rapidly turning waste land into farm land. The Roosevelt dam in Arizona irrigates over two hundred thousand acres of land. The Elephant Butte, in the Rio Grande Valley, has been under way for two years, and it will take at least five years more to finish it. The lake that will be constructed will cover forty-one thousand acres of land, from ten feet to two hundred feet in depth, and it will be forty miles long, with a width varying from one to ten miles. One hundred and eighty thousand acres are to be reclaimed in New Mexico and Texas, while a part of the benefit will recur to old Mexico. All these harnessings of water power will not only irrigate vast areas of arid land, but will furnish power in the way of electricity, which will make the farm homes as well furnished with power and with light as the most progressive of our cities and villages. We are only beginning this work of conservation and reclamation. The United States of 2000 will be fairly in the hands of the people. We are not as badly crowded as our British ancestors, who could only settle along the river courses, but we have by no means as yet mastered the continent. We are on the road only.

Mixt Marriages

It is a real relief which the authority of the Vatican gives in revoking a rigorous clause in the *"Ne Temere"* decree against marriage of Catholics with non-Catholics, and for the past few weeks there has been much discussion of the matter in Catholic journals, a number of which were more Papal than the Pope and unwilling to admit that any relief was given. *The Western Watchman* has been especially severe in rebuking these foes of clemency. The *"Ne Temere"* decree forbade priests to assist in any marriages in which the Protestant party should persistently refuse to have the children brought up in the Catholic Church. The present decree, on account of practical difficulties that have arisen, withdraws the previous prohibition. It reads:

> "The prescription of the decree *'Ne Temere,'* concerning requiring the officiating priest to require and to receive the consent of those wishing to marry, in the case of mixt marriages when the parties pertianciously refuse to consent to the required cautions, is hereafter abrogated (*locum posthac non habere*)."

Of course, this is meant to be very exceptional, and the parish priest is required to use his utmost influence to secure the desired pledge, but if it is refused he can marry the parties as a

better course than to have them driven to a civil marriage not recognized by the Church as true wedlock. The attempt has been made to represent this as applying only to certain countries, but the Latin text of the decree makes it general.

An Arithmetical Test

The Tamils are one of the primitive races of India, driven into the hills and islands long ago by the invading Aryans, which conquest, according to prevailing notions, demonstrated the racial superiority of the Aryans. Now the Indian Aryans are in subjection to the Aryans of the West. How much superior must, then, be an educated Englishman to a Tamil boy? The measure of mental superiority adopted in this country is the examination, particularly in mathematics. "Pass him anyway, if his arithmetic paper is good," is the tacit rule all the way up our educational ladder. There was an interesting test of this kind at Colombo last month, when a Tamil boy appeared before the Ceylon branch of the Royal Asiatic Society, convened to consider his arithmetical powers. The boy was, by special permission of the president, Sir Hugh Clifford, Colonial Secretary of Ceylon, permitted to sit down in the presence of the superior race, because he could not cipher so well standing. Representatives of the Ceylon Department of Education were on hand with complicated problems, worked out in advance. One of them was: "A man gave to 173 persons a bushel of rice each. Each bushel contained 3,431,272 grains, and the donor stipulated that 17 per cent. should be given to the temple. How many grains did the temple receive?" When the question was translated to the boy he gave the answer within three seconds, 100,913,709.52. "Wrong," said the representative of the Education Department, who had 100,913,719 on his paper. But the boy shook his head, and altho the problem was repeated to him several times he stuck to his answer. After the representative of the Education Department had gone home and figured it out once more—nothing said about how long it took, the stopwatch not being held on him—he was obliged to confess that he had accidentally added a ten and forgotten the decimal. Making all due allowances, our race pride as an Aryan has received a shock by this incident. We know that such mathematical prodigies are liable to crop up anywhere, and, like musical prodigies, often do not show any more ability in other lines than less gifted individuals. We are ready also to admit that the significance of arithmetic is exaggerated in our examination system. But, after all, we can nevermore look down on Tamils and other of the "lesser breeds" from the proper hight again. It is getting very hard for us Aryans to maintain that sublime confidence in racial superiority which Max Muller instilled into us and Kipling and Chamberlain are assiduously cultivating. The exceptions of one kind and another are so conspicuous—and so numerous.

The Latest Phenician Inscription

Perhaps Dr. Lidzbarski, editor of the *Semitische Epigraphik,* regards the Moabite inscription as rather Hebrew than Phenician, when he speaks of the inscription lately found at Sendjirle, in Cilician Asia Minor, as the most important Phenician inscription yet discovered, being more interesting in its contents than that on the sarcophagus of Eshmunazar, and more complete than that of the tariff of sacrifices from Marseilles, while older than either. In a later portion of the same palace had been found Aramean inscriptions of the kings Hadad, Barrekub and Panammu; this is of the eighth century B. C., and it is remarkable that it is not Aramaic, but pure Phenician, except in the use of *bar* instead of *ben* for *son,* and is thus closely allied to Hebrew. It is interesting, not only for philological or historical reasons, but also for its ethical and patriotic spirit. Following the translation of Lidzbarski, who is an authority of the first rank and who has the advantage of late attempts at translation by Littman, D. H. Müller, Prætorius, Lagrange, Halevy and Hehn, it reads as follows:

"I am Kilamu, son of Haya. Gabbar ruled over Yadi, and he accomplished nothing. Then followed Bamah, and he accomplished nothing; then was my father Haya, and he accomplished nothing; then was my brother Saal, and he accomplished nothing. I am Kilamu,

son of Tammat [mother], and what I have accomplished that have my predecessors not accomplished. The house of my father was under the power of mighty kings, and all stretched out their hands to devastate it. Then was my beard consumed, then was my hand consumed. The king of the Danians had power over me, since he had hired against me the king of the Assyrians. A maiden a man gave for a sheep, a man for a garment.

"I, Kilamu, son of Haya, set myself on the throne of my father. In the presence of the earlier kings the Muskab had walked about like dogs. But I was to them like a father; I was to them like a mother; I was to them a brother. Him who had not the sight of a single sheep I made to be the possessor of a flock of sheep. Him who had not enjoyed the sight of a single ox I made the possessor of a herd of oxen, the possessor of silver, the possessor of gold. The one who from his youth had seen no linen, in my days clothed himself in byssus. I stood by the side of the Muskab as a protector, so that they showed to me their mind, as the fatherless child to its mother."

The remainder of the inscription is given to blessings or curses on whosoever should preserve or deface it. In that early day, as now the cost of living was a political question, and the aim of a just ruler was to bring prosperity to his people.

Revising the Revision

It is only twenty-five years since the Revised Version of the English Bible was issued, and already the desirability of a second revision has been seriously broached. A committee of English Nonconformist scholars have considered it, and have put forth a statement signed by J. Rendel Harris and fifteen others, in which they say that the time is not yet ripe for it. While they recognize the great improvement made over the Old Version, they yet recognize that it is not without defects. A principal one is that the revisers, while they made needed corrections in the Greek text of the New Testament, yet held close to the common Hebrew text of the Old Testament, and even to the Jewish commentary found in the vowel points. While the apparatus for emending the Hebrew is not as complete as for the Greek, yet there are not a few cases where it is clearly wrong and should be corrected in translations, as it is in critical commentaries. Yet it would be well that this study of the original text should go further before a new translation be attempted. In the New Testament much new study has been given to the Greek text in the last twenty-five years, particularly of the versions, and much more needs to be done, particularly on the Septuagint, the various texts of which, Hesychian, Lucianic, etc., must be disentangled. There has been a striking increase of material for the study of the New Testament text, particularly in the separation of the families in which manuscripts may be classified, as well as in the discovery of old manuscripts. The defects of the Revised Version are caused in part by the dependence on textual theories which now command less confidence, and partly on a rigid literalness of translation, using the same English for a Greek word, which savors of pedantry. The discovery of fragments of Greek papyri in Egypt has given much knowledge of the popular language in which the New Testament was written and shows how the Revisers at times were too faithful to classical usage. These scholars say that at least ten years more are needed for settling questions of text before a new revision should be attempted, and that when it is made the Old Testament Hebrew should be corrected as well as the Greek of the New Testament.

The Supreme Court of Massachusetts, following the Supreme Court of New Hampshire, has declared the will of Mary Baker Eddy, founder of Christian Science, to be valid, and that the heirs at law have no legal claim upon her estate as against the Christian Scientist First Church of Boston. But under a Massachusetts statute no church can hold property of more than $2,000 income annually (parsonage excluded). Therefore the trustees of the church cannot hold the property, but it will be held for the advancement of the Christian Science faith by a trustee to be appointed by the court. The property is a large one, and its existence as an endowment, if it is not providentially exhausted or lost, will tend to keep the organization of the Christian Science Church from becoming extinct a good deal longer than it otherwise would. We suppose that as the property was all made out of the Church it is proper that it should return there.

Altho the Japanese court which tried the Koreans charged with a conspiracy to kill General Terauchi, Governor-General of Korea, has condemned over a hundred of them to terms of imprisonment, it is far from wise for American Christians to flood the Emperor of Japan with individual letters asking him to grant clemency to them. We understand that appeals have been taken to a higher court. So far as we can judge by the reports published of the arguments in defense, they went very far in the direction of admitting that some of the men were guilty and pleading extenuating circumstances.

A very small incident may involve a large principle. Such was the act of the school board of Cedar Grove, N. J., in suspending a boy because at the command of his father, who is a Canadian, he refused to promise allegiance to this country in saluting the flag. The school board said that if the boy could not promise allegiance he should be sent to a private school. We do not see it so. It is for the benefit of the country to educate all children who live here, whether of native or foreign birth, and certainly a father who pays taxes has the right to the advantage of the schools as well as of the streets.

One would expect the purpose of *The International,* judging from its title, to be to cultivate sympathy between the nations. But a long article this month declares Great Britain to be "The Arch-Enemy of the United States," and it concludes by asserting that every self-respecting American should reach the conclusion that the celebration of the signing of the treaty of Ghent with Great Britain nearly a hundred years ago "should be prevented by every possible means." We had hoped that even our Irish patriots had mollified their hatred of England in these late years.

It is a most extraordinary and regrettable condition by which a vicious California law disfranchises the members of the national Republican party. The Progressives took possession of the Republican primaries and chose Roosevelt men as electors, and the peculiar law does not now allow a genuine Republican ballot to be cast, except as the names of the Taft electors are written in. The Chief Justice said, when the Republicans sought relief ineffectually: "It is a very bad primary law. It disfranchises absolutely voters of this State and deprives them of the exercise of their functions as independent voters." Thou shalt not steal.

It is interesting to observe that the Japanese comments on the suicide of General Nogi and his wife are by no means all favorable. They all express admiration for the man, but some of the most influential journals plainly declare that it was rather his duty to give what aid he could to the new Emperor, whose father he had served. One distinguished Buddhist scholar calls it the "last flicker of *bushido.*" It is not unlikely that the effect will be to weaken rather than strengthen the hold of this exaggerated loyalty in Japanese thought.

A leading German paper publishes the opinion that it is a perfectly impracticable scheme which Sun Yat-sen has undertaken to carry out, to construct a great railway system for China, and that he is not the man to do it. Perhaps so; but we remember that it was a most impossible scheme he undertook to overthrow the empire and create a republic for China, but he did it. To gridiron China with three railways from the coast to Tibet is a more reasonable task.

That extraordinary lynching in the Wyoming penitentiary by the prisoners there of a negro who was so bad that the prisoners could not endure him has had a strange sequel. Finding that they could overpower the guards they did it again, and many escaped, and some of them have already met with death in the attempt to capture them. Thus irregular justice results in more irregular justice, and prison discipline will have to be hardened.

The British Unionists complain that the Home Rule bill is to be "rushed." A party that does not want a bill enacted always complains that way. One would think that thirty-two more days for discussion, in addition to the seventeen already spent, would be enough in all reason.

Insurance

Publicity Work

A MEETING of the Bureau of Publicity of the International Association of Casualty and Surety Underwriters was held at the Hotel Astor, in New York City, one day last week, to amend the constitution and take action on a proposal looking to the absorption of the Educational Bureau, recently organized by the Detroit Conference. The last named organization is composed entirely of stock and mutual companies and associations which make a specialty of furnishing the working classes with protection against accident and sickness on the monthly instalment premium plan. Many of the members of the Detroit Conference are likewise members of the International Association and its Bureau of Publicity, and there was naturally a desire on the part of both parties to merge into one working body the educational or publicity work of both.

The first obstacle encountered consisted in a proposal on the part of some of the International Casualty people to remove the headquarters of the Bureau of Publicity from Hartford to New York, a proposition which was opposed by all the Detroit Conference faction and an influential coterie of International members. The motion to make the change was voted down.

It developed later that the International members advocating this change had not only excepted to a circular letter sent out by the Conference people, which the former insisted would be construed into an adverse criticism of workmen's compensation laws, and which the International people were promoting, but that they had in mind a program that would materially alter the official personnel of the amalgamated bureaus if the merger occurred.

The Conference people explained and defended the circular letter objected to, and disavowed any intention of opposing the enactment of workmen's compensation laws. They further held that the objectionable document would bear no such construction as that put on it, and that a fair interpretation would prove it to be but a fair argument for the use of industrial accident and sickness insurance as a complement of workmen's compensation indemnity, particularly as the last named form of benefits cover but about ten per cent. of the workmen's time, leaving the other ninety per cent. to be protected by some other form of insurance.

The resolution to negotiate with the Detroit Conference Bureau of Education for a merger was adopted by a small and close vote, all the Conference and a part of the International membership voting for it; but the vigorous opposition of a number of International companies indicates their secession in the future from the work of the Bureau of Publicity. There seems to be an irremediable difference between the two factions at present, and it is highly probable that the secessionists, with a few others, will organize a separate bureau under the direction of a gentleman of considerable prominence in industrial economics.

Whatever the merits may be of the contention that the Conference circular is injurious to the promotion of future compensation laws, if the argument made in its justification is to be considered, then it was at best injudicious, for it gives the advocates of State insurance an opportunity to advance their cause at the expense of both industrial and liability companies. The legislator is apt to conclude that if existing compensation laws reach but ten per cent. of the way in the interest of workmen, it is the duty of the State to widen their activity by enacting laws that will cover the whole one hundred per cent.

IN a speech delivered at Hartford, Conn., last week, Colonel Roosevelt advocated Federal supervision of insurance, "not to the extent of interfering with the taxing power of the States, but so as properly both to regulate and protect the insurance companies."

Financial

The Demand for a Higher Yield

THE past few years have seen a radical revision of the average investor's ideas as to the amount of income he ought to be getting from his investments. It was not so long ago that 4 per cent. was considered a fair return; today the bond houses report that they cannot get their clients to consider bonds which yield less than 5 per cent., and that the real demand is for securities yielding even more.

The cause of this most important change in investment conditions is the rise in the cost of living. That is generally understood. Its effects, unfortunately, are less well appreciated. In a general way the buyer of investments realizes that the demand for a higher yield has brought about something of a change in the general character of the securities being offered, and that it may not be a good thing for some of the corporations to be paying what they are being forced to pay for the money they need. But by few investors is the importance of these developments fully understood. The public realizes that higher income-bearing stocks and bonds are being offered than formerly, but it doesn't realize the vast amount of insecure "securities" which have been brought into existence and widely distributed. It knows in a general way that some of the railroads and big industrial corporations have had to raise their bids for money, but there is nothing like general appreciation of the difficulty some of these companies have had in getting needed funds at all, or of the makeshift forms of financing to which they have been forced to resort.

Seven per cent. preferred stocks, high interest-bearing income bonds, real estate debentures — these and a number of other comparatively new forms of security have been widely distributed during the past year in response to investors' demands for a higher yield. Some of them are securities of merit, but along with the wheat there has gone a great amount of chaff. Discrimination among new and comparatively untried kinds of securities is difficult; it isn't easy, for instance, to judge the relative merits of several issues of real estate bonds or of the new industrial preferred stocks. And very much alive to that fact have been the less scrupulous sellers of securities. If investors have developed an appetite for this or that kind of stock or bond, they have reasoned, that particular security is the kind to offer. Buyers haven't yet had enough experience to be able to tell what's good from what isn't.

That is one important result of this development of a demand for a high yield. Another is the serious weakening of the financial position of many big companies which have had to get money, and in order to get it have had to pay exorbitant rates. One of the biggest railroads in the country recently arranged a long-term loan on a basis which made the money cost it between 10 and 11 per cent. It had to have the money and the terms were the best it could make. Nor is that an isolated instance. All over the country, railroads and industrial companies have been forced to pay rates for money which will prove a burden on their necks for years to come.

In some cases that has been apparently obviated by the issue of bonds having only a few years to run. We'll issue these notes at a high rate of interest, the company reasons, to tide us over; in a few years, when they come due, conditions will be better and we'll be able to replace them with regular long-term bonds sold on a more advantageous basis. Makeshift financing! High bankers' commissions in the first place and several of them. A high rate of interest. And then, what certainty that, when the notes come due, "investment conditions" will be so much better that it will be possible to sell regular bonds on better terms?

Certainly there is another side to the present high income obtainable than the mere receiving of more interest on the same amount of principal.

The Independent

VOL. LXXIII NEW YORK, THURSDAY, OCTOBER 24, 1912 No. 3334

Survey of the World

Mr. Roosevelt Shot

On the 14th Mr. Roosevelt was scheduled to deliver a speech in the Milwaukee Auditorium, but before going to the theater his party motored to the Gilpatrick Hotel. After dining, the campaigners were taking their places in automobiles when a man in the cheering crowd raised a 38-caliber Colt revolver and fired at Mr. Roosevelt at close range. A stenographer, formerly a college football player, Elbert E. Martin, aged twenty-nine years, prevented the man from firing a second shot, and it was at first thought that Mr. Roosevelt was unwounded. After it was found that the ball had entered his breast, about half an inch under the right nipple, Mr. Roosevelt still insisted upon delivering his speech. "It takes more than that to kill a bull moose," he said in opening, and continued for an hour and a half. He showed his audience the fifty-page manuscript of his speech, which had reduced the force of the bullet in its passage, as had a spectacle case. Of his assailant, Mr. Roosevelt said:

"I do not know who he was, or what party he represented. He was a coward. He stood in the darkness in the crowd about the automobile, and when they cheered me, and I got up to bow, he stepped forward and shot me in the breast. It is a very natural thing that weak and vicious minds should be inflamed by the kind of vile mendacity and abuse that have been heaped upon me for the last three months by the newspapers, in the interests not only of Mr. Debs, but also of Mr. Wilson and Mr. Taft. . . . I wish I were able to impress on our people the duty to feel strongly but to speak truthfully of their opponents."

When he had discussed at some length the attack upon him, and said that for his own part he "did not mind a rap" having been shot, Mr. Roosevelt took up the lines of his speech as originally planned. His friends were greatly relieved when he reached the end without showing grave signs of weakness, for evil effects were dreaded from the strain. Afterward the speaker was removed without discomfort to Chicago, where he was placed in the Mercy Hospital. There it was found that the wound was more serious than had been realized; tho the bullet missed the lung, it had not given a mere flesh wound, as supposed, but had penetrated four inches inward and downward, breaking a rib. The wound was not probed, and the only danger specifically feared was infection. The patient was inoculated against tetanus, and up to Monday, the 21st, his improvement was constant and rapid. Campaigning dates were at once canceled, tho Mr. Roosevelt did not lose touch with the situation and issued press bulletins. Members of the ex-President's family hastened to Chicago. On the 21st he left Chicago on a slow train for New York, en route for Oyster Bay. Among the many messages of sympathy received were those of President Taft, Mr. Debs, Governor and Mrs. Wilson, and the Democratic campaign managers. John Schrank, Mr. Roosevelt's assailant, aged thirty-six years, is a native of the village of Erding, in Northern Bavaria, where he is remembered today as a young man of eccentric and inefficient character. He is still carried on the German army lists as a deserter. He emigrated to New York City sixteen years ago, with his father, who became a saloonkeeper on the lower East Side. Schrank himself formerly worked as a bartender, till he inherited property valued at $25,000. Since then he has not

prospered. He has nursed an imaginary grievance against Mr. Roosevelt ever since the latter served as police commissioner in New York in 1895, and closed his uncle's saloon; and latterly has regarded himself as a divine instrument for the removal of Mr. Roosevelt as a supposed enemy to the nation's liberties, and to save the country from civil war. Tho he says he attended New York night schools, he is incoherent in the style of his letters and numerous memoranda. Yet he read newspapers—notably criticisms of Mr. Roosevelt's attempt to set aside the third term tradition. Among his papers was found an account of a dream in September, 1901, in which the late President McKinley told him that Mr. Roosevelt, and not Czolgosz, was responsible for the assassination at Buffalo in 1901. McKinley appeared to him in a vision last month, he says, and told him to avenge his death. Schrank's confession is signed "Innocent-Guilty," and is inscribed with the opening line of the Lutheran hymn, *"Ein feste Burg ist unser Gott"*—"A Mighty Fortress is Our God." Schrank was placed under immediate arrest, and protected from the angry crowd which witnessed his attempt at assassination. He pleaded guilty on the 15th, and was bound over to the December session of the Criminal Court. He followed Mr. Roosevelt south from New York, on September 21, and north again to Milwaukee. Schrank says he took no one into his confidence. There is no evidence that the man is an Anarchist. He says he is a member of no political party. He is unmarried. His fiancée lost her life in the "General Slocum" disaster, in 1904, when the excursion boat burned and caused the loss of over 1,000 persons—many of them German Lutherans.

Course of the Campaign

After Mr. Roosevelt had been disabled by his wound, Governor Wilson decided to cancel as many of his platform engagements as could be laid aside. As Mr. Taft, he said, had not been active in the campaign, he was unwilling to be the only candidate on the stump, and he would await Mr. Roosevelt's recovery. Reports of a speech made by him in Pittsburgh on the 18th were read with much interest, on account of his statement concerning the Democratic party's attitude toward the tariff. He said:

"The Democratic party does not propose free trade or anything approaching free trade. It proposes merely a reconsideration of the tariff schedules such as will adjust them to the actual business conditions and interests of the country. Every observant business man must have realized long ago that the tariff schedules were constructed in such a way that business was not upon a normal basis in the United States. They do not constitute a system of well considered protection. On the contrary, they embody innumerable cunningly devised and carefully concealed special favors and particular groups of capitalists and manufacturers have taken advantage of these special favors to build monopoly up in a way that is threatening and dangerous to every new and independent enterprise. Our field of industry is like an untended garden. Some of the plants have so overshadowed the rest as to give them no chance of light or air. Their roots, moreover, have monopolized the soil, and new growths are all but impossible. If we would have stable prosperity, we must admit light and air and freedom into the whole process of our industrial life, and it is with that object that the Democrats will approach the revision of the tariff. Their desire is not to check, but to aid; not to embarrass, but to quicken. They will not undertake the task like amateurs, either. They will seek and obtain the best possible advice in the country, but they will seek it far and wide, and not only in the quarters from which it has usually come."

Two or three letters written by Mr. Taft were published. In one of them, addrest to the president of the Union League Club, in New York, he said:

"I am very hopeful that the contest that is now pending will result in a Republican victory and that in this way the protective economic policy of the Government may remain unchanged, business be undisturbed and the prosperity that is now on our threshold may not be halted or driven away, and that the lovers of our Constitution and the institutions of civil liberty preserved therein may have no cause for alarm from threatened radical changes which would shake the structure of democratic, representative, constitutional government which our forefathers and we have so laboriously, carefully and lovingly reared for the lasting benefit of the American people."

Writing to Congressman Moore, of Pennsylvania, he urged that State to "hold to her moorings." He had vetoed the Democratic tariff bills "because they were not in the interest of the American workingman, but were especially adapted to encourage industrial activity and

competition in foreign lands." He deplored the interference of a third party:

"In a contest between Republicans, who believe in protection, and Democrats, who seek to tear it down, the protectionist who votes for a third candidate is giving aid to the enemy. In effect he votes for the Democrat."

In a statement published on the 20th he asserted that the wave of extremely high prices for food had reached its hight in the United States and was subsiding. Agricultural prosperity here was reducing the cost of food products, altho the reduction had not yet reached consumers. The great crops of corn, oats, potatoes and hay must within a few months affect the price of meat. In another statement, on the following day, he predicted Republican victory:

"From all parts of the country assurances are coming that Democrats intend to vote for the Republican candidates and a continuance of prosperous business conditions, and against the programs of economic confusion and socialistic subversion of our institutions supported by the Democratic candidates and their allies. Democratic workingmen refuse to be led from the factory and good wages of 1912 back to the Democratic hard times of 1893-97. They prefer independence and money in the savings bank to loss of employment and dependence on charity."

It was obvious, he added, that either the Republican or the Democratic nominee would be elected, and "not to vote for the Republican candidates is in effect to support their Democratic opponents." It was well known to every one that the third term party did not expect success, and it remained to be seen how many Republicans were "willing to hand the reins of government over to the Democrats to gratify mere desire for revenge."——Betting in New York last week was at odds of 3 or 4 to 1 in favor of Governor Wilson and at even terms on the President and Mr. Roosevelt.

Political Funds

Additional testimony was taken last week by the Senate committee that is inquiring concerning campaign funds. It was shown that $208,565 was contributed for the promotion of the nomination of Governor Wilson, and that $85,800 of this sum was given by a small group of men who had been classmates of the Governor or trustees of Princeton University at the time when he was president. The leader of this group was Cleveland H. Dodge, who gave $51,300. Another contributor was Cyrus H. McCormick, who has been associated with George W. Perkins in the International Harvester Company. This corporation had not then been sued, but Mr. Dodge suggested to Mr. McCormick that he should take back the money, $12,500. But Governor Wilson decided that the contribution should be retained, as the giver had been a generous friend of the university and had contributed in good faith and without conditions. Among the other gifts was one of $10,000 from Charles R. Crane. In the interest of Governor Harmon there was a fund of $150,946, and $77,000 of this came from Thomas F. Ryan. The latter also gave $35,000 to Congressman Underwood's fund, which amounted to about $50,000. Mr. Dodge and George W. Perkins loaned $35,000 to a Trenton newspaper which supported Mr. Wilson, but for the loan there was ample security. Arthur I. Vorys testified that about $80,000 was received in Ohio for the promotion of President Taft's renomination. This sum included $64,800 from Charles P. Taft. Alton B. Parker said that late in the campaign of 1904 he was told by Daniel S. Lamont that a group of men representing corporate interests had agreed to contribute a large sum for the election of Mr. Roosevelt. These men were E. H. Harriman, James Stillman, H. C. Frick, Robert Bacon, Charles F. Brooker, George W. Perkins and Daniel G. Reid. Mr. Reid denies that he was in such a group. On the 18th Elmer Dover, secretary of the Republican committee in 1904, produced at the investigation a list of the contributors in that year. This list had been copied from Treasurer Bliss's private memorandum book with the treasurer's consent. It fills three columns of a daily newspaper, and the total is $2,280,018. Among the contributors were E. H. Harriman, $150,000; J. P. Morgan & Co., $150,000; George J. Gould, $100,000; Chauncey M. Depew, $100,000; George W. Perkins, $160,000, and Whitelaw Reid, $30,000. Thirteen contributions in one group, amounting to $260,000, appear to be those collected by Mr. Harriman after his visit to the

White House, and the testimony of the list tends to support Mr. Harriman's account of the incident rather than Mr. Roosevelt's. To "H. H. R. and J. D. W." is credited $100,000. The initials (one copied incorrectly) are supposed to be those of H. H. Rogers and John D. Rockefeller or John D. Archbold. In some instances large sums were raised by committees and were assigned in the list to the committee's chairman. Medill McCormick, of Chicago, a prominent supporter of Mr. Roosevelt, in the course of his testimony called Secretary Hilles a liar, "whose falsehoods incited weak-minded men to actual assassination." He was checked and reproved by the committee.

Storm Losses in the Philippines

A typhoon of great violence swept over the Philippine archipelago on the 16th, causing a loss of at least 1,000 lives and $25,000,000 worth of property. The area affected by the storm extended from Surigao on the south to Tacloban on the north. Cebu's loss is $10,000,000. It is said that half of the island's 600,000 people are homeless. In the chief harbor twelve steamships, twelve tugs and seventeen schooners were wrecked. In other places hundreds of small sailing vessels were sunk or beached, and many sailors were drowned. In Leyte 2,000 houses were destroyed, and the sugar, hemp and cocoanut crops were ruined. Tidal waves inundated the coasts of Leyte and Cebu. Late reports say that all of the Government ships are safe. Naval vessels from Manila have gone to aid the unfortunate islanders in Cebu and Leyte, taking doctors and supplies.——Mr. Taft will nominate Walter F. Frear to succeed himself as Governor of Hawaii. There were charges against him, and Secretary Fisher went to the islands, where he made a careful inquiry. He was convinced that the charges had not been well founded and that the Governor ought to be reappointed.——It is expected that the report of the commission which has been considering the situation in Santo Domingo will not be favorable to the present Government, and will say that a new election, under American supervision, is needed.

A New Revolution in Mexico

The Madero Government is now menaced by a new and formidable revolutionary movement, led by Felix Diaz, a nephew of ex-President Porfirio Diaz, who was formerly chief of police at the capital and was a colonel in the Federal army until two months ago, when he resigned. On the 16th, Diaz, with 500 men, took possession of the city and port of Vèra Cruz. Nearly all of the Federal troops there joined him, and with them came 1,000 volunteers. Three of the Government's four gunboats in the harbor fell into Diaz's hands. At last accounts he had about 3,000 men in the vicinity of Vera Cruz. At Jalapa, under General Aguilar, were 1,000 more, and the movement was spreading. The Federal garrison at Tuxpam went over to Diaz. Madero hastily withdrew soldiers from the north and elsewhere and planned an attack upon the new revolutionist. General Huerta, who commanded the army in its successful attack upon Orozco in the north, was directed to lead the forces against Diaz. He declined to do so. Some think a large part of the army will join the new rebel commander. It is said that our State Department has proof that he is supported with money and otherwise by his uncle Porfirio. Evidence that several officials at the capital are in sympathy with him has been obtained by Madero. Orozco is on his way from the north to join him, but there is some doubt as to the attitude of Zapata. In the Chamber of Deputies a resolution calling for the resignation of Madero's Cabinet was rejected, and one expressing confidence in the Madero Government was adopted, on the 18th, after a stormy debate. Madero has vetoed a bill increasing the Deputies' salaries by 100 per cent. He says the Diaz movement is not one of much importance, but many think his Government is in danger.——The father of General Orozco, arrested for conspiring to violate the neutrality laws, has been acquitted at El Paso, but is held to await the result of extradition proceedings. Two Americans were captured by rebels in the north last week, and held for ransom. One of them, Arthur McCormick, manager of the Palomas ranch, was released

when his friends paid $5,000.——At the beginning of the present week it was expected that a battle would soon be fought near Vera Cruz. In that city, on Saturday, the Diaz forces fired upon a procession of Maderists and killed fifteen.

Central and South America Minister Weitzel reported on the 15th that peace had been restored in Nicaragua. Six thousand Government soldiers had been paid off and discharged and the army was virtually disbanded. Fifty men prominent among the revolutionists fled to Salvador, where they were captured and disarmed by the Government. They are now under guard at the capital of Salvador.——Mr. Taft is planning another trip to Panama, desiring to inspect the canal. It is said that he will go before the end of the year. ——Our Minister to Colombia, who is now in this country, has prepared for the State Department a report concerning terms for a settlement of the controversy with Colombia about Panama. Dispatches from Washington say he expresses the opinion that the United States cannot afford to ignore Colombia's claims and arguments, and that he hopes to bear with him, on his return to Bogota, instructions that will facilitate a settlement.——The British Government decided, last week, to appoint a select committee for an inquiry as to the responsibility of the English directors of the Peruvian Amazon Company for the cruel treatment of natives in the Putumayo rubber districts.

Turkey Makes Peace with Italy On the third and last day of the final limit allowed by the Italian ultimatum, the Ottoman Government gave way and consented to the terms insisted upon by Italy. The six Italian and Turkish representatives met in the reading room of the Hotel Beau Rivage at Ouchy, Switzerland, at 10 o'clock in the morning of October 19, but it was not until 6 o'clock, after repeated conferences and withdrawals for consultation and telegraphing, that the details were settled and the papers prepared for signature. Then Signor Bertolini with a bow offered the pen to Naby Bey, who signed the protocol. The definitive treaty will be signed soon and will be known as the Treaty of Lausanne. Italy's sovereignty in Tripoli is to be recognized, but the Sultan is to have judicial jurisdiction over the Moslem inhabitants. At the beginning this will be vested in Shemsedin Bey, the former Turkish Minister at Teheran, who will have a native judge under him, as is done in Egypt. Turkey will withdraw her forces from Tripoli and Italy will bring back her troops from the Ægean Islands. The pacification of the Arabs will be left to Italy. Italy under the agreement is to associate herself with the Powers in trying to end the war in the Balkans speedily. She will also pay an annual sum to Turkey, but the amount has not yet been fixed.

Fighting on Four Frontiers The allied Balkan states took the initiative last week by the invasion of Turkish territory. The first to act was the smallest, Montenegro, for in this case mobilization is a short and simple operation. The men of the Black Mountains always carry arms and the women constitute the commissary department and hospital corps. While the able-bodied men are at the front the rest of the family are expected to prepare food and take it to them. This primitive method of warfare is obviously not suited to a distant or long continued campaign, so it is not surprising to hear that the rapid advance of the Montenegrin army from Podgoritza toward Skutari, recorded last week, has been checked and little progress has been made since so far as can be told by the dispatches. The army has been embarrassed by its very success, for in the capture of the first Turkish town on the road, Tuzi, 5,000 or 6,000 Ottoman soldiers were taken prisoners. The number of killed and wounded is probably over 1,000. Doctors and nurses are few, and three days after the battle hundreds of suffering soldiers still lay upon the field at Tuzi without having received even first aid. The need of Red Cross assistance is imperative. King Nicholas of Montenegro has been obliged to restrain the impetuosity of his people by the publication of a manifesto ordering them not to waste their lives so recklessly by charg-

WILL THEY GET THE TURKEY BY THANKSGIVING TIME?

ing the Turkish fortification as soon as they get within sight of them, but to wait for the artillery to be brought up. His sons, Prince Danilo and Prince Peter, have distinguished themselves by their courage on the field of battle, and the latter has been promoted to the rank of major. General Martinovitch some days after the capture of Tuzi pushed forward along the northern shore of Lake Skutari and stormed the hights about Tarakash, the strongest of the outposts defending Skutari. The bombardment of Tarakash has begun. The Montenegrins have been equally successful on the northeastern frontier. General Vukotitch, crossing into the Sanjak of Novibazar, after ten days of hard fighting captured the town of Berana on October 16. The victory was achieved by a double night maneuver; one party stormed Rogame hights, defended by two Krupp guns, while General Vukotitch with another division broke thru the Turkish lines to the east, and in the morning appeared on the rear of the town Most of the garrison, 4,000 Turkish regulars and 3,000 Albanians, escaped during the night, but the rest, 1,200 Turkish troops, surrendered in the morning with fourteen Krupp guns, a large quantity of ammunition, and two months' supplies——War was declared by the Turkish Government on October 17 against Servia and Bulgaria, giving as reasons that the note addrest to the Porte demanding reforms in Macedonia was an interference with the internal affairs of the Ottoman Empire, and that the mobilization of the Bulgarian and Servian armies and daily skirmishes on the frontier made peace impossible. King Peter of Servia issued a declaration of war the same day and followed it with a manifesto calling upon all Christians to unite in a holy crusade to drive the Turks from Europe, and on the 19th the First Corps of Servian troops, under the Crown Prince, crossed the frontier near Ristovatz, to the east of Prishtina, with Uskub as their objective. The Turks have destroyed the railroad leading from the Servian frontier to Uskub. ——The Greek army under Crown Prince Constantine on October 19 attacked Elassona, just over the northern border, and after four hours' fighting captured it. At the same time two battalions and batteries crossed the Arta River, which bounds the Greek territory on the west. Two Greek gunboats accomplished the difficult feat of entering the Gulf of Arta in the night, altho the narrow and shallow entrance is commanded by the Turkish fortifications at Prevesa, where a torpedo boat has been

sheltered during the Italian war. Deputies from Crete have been admitted to the Greek Parliament, and, since Crete still nominally belongs to Turkey, this was taken by the Turkish Government as the equivalent of a declaration of war.

The Bulgarian Advance

Bulgaria, as the largest of the Balkan states and the nearest to Constantinople, must bear the brunt of the war, and it is expected that an important, perhaps decisive battle will soon be fought in the vicinity of Adrianople. At this point the main force of the Turks has been concentrated, probably about 250,000 men, and toward this point the Bulgarians are marching, with perhaps an equal number. Mustafa Pasha, the first town on the Turkish side of the boundary and 17 miles northwest of Adrianople, was captured by the Bulgarians on October 19. King Ferdinand and the Bulgarian commander-in-chief, General Savoff, witnessed the engagement from a hight at Varmaly Belitza, on the frontier. The attack was carried out by General Ivanoff, who drove the Turks from the railroad station across the wagon bridge over the Maritza River to Mustafa Pasha, on the eastern side of the river. The Turks blew up the bridge behind them, but it was rebuilt by the Bulgarians, who then took the town. Besides this advance upon Adrianople along the line of the railroad and down the Maritza River, the frontier has been past by two other divisions of the Bulgarian army, directed toward Adrianople, one to the west thru the Rhodope Mountains and the other 30 miles to the east, near Kirk Kilisse.——The Turkish fleet appeared before Varna, a Bulgarian port on the Black Sea, at 6 o'clock on the morning of October 19, and bombarded the town in the afternoon. The shells did no damage and the fleet retired.

THE FIRST WEEK OF THE WAR

1, Montenegrins advance on Skutari. 2, Montenegrins enter Sanjak of Novibazar and capture Berana. 3, Bulgarians advance on Adrianople and capture Mustafa Pasha just across the frontier. 4, Servians advance on Uskub. 5, Greeks cross the frontier and capture Elassona, at the foot of Mount Olympus. 6, Turkish fleet bombards Varna.

The Political Parties: Their Appeal to the Nation

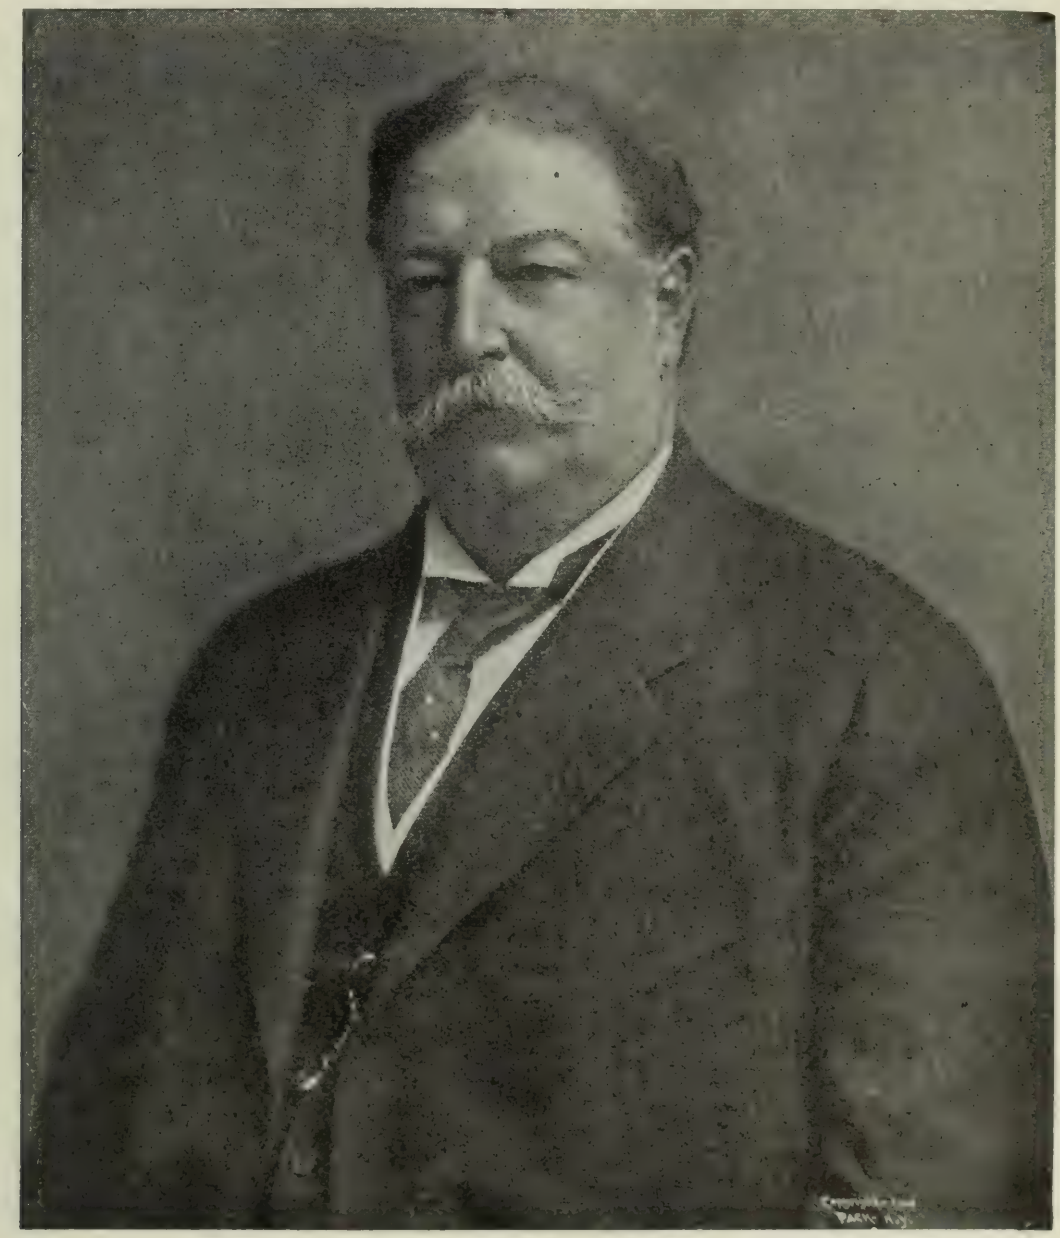
BY THE PRESIDENTIAL CANDIDATES

During the last four Presidential campaigns THE INDEPENDENT *has been favored by the candidates with statements by themselves of the issues their parties have represented and the reason of the appeal they have severally made for support at the polls. We are again much indebted to the candidates at the present election, who have acceded to our request.*—EDITOR.

The Republican Party's Appeal

BY WILLIAM HOWARD TAFT

CANDIDATE OF THE REPUBLICAN PARTY FOR THE PRESIDENCY OF THE UNITED STATES.



IN complying with the request of THE INDEPENDENT that I write something on the issues of the present campaign and the claims of the Republican party, my time is so occupied that I can do it only in great haste. The important question of the campaign is not materially different from that which arises in every Presidential election, to wit, whether the work of the existing Administration shall be approved by continuing in power the same political party, or shall be condemned by turning the administration of the country's affairs over to the Democratic party.

Two phases of practically the same question present themselves to the American people at the present time: first, the party, its history, and its platform; second, the personality of the candidate as expressed in his record of the past four years. The two combine in the normal and logical question to be asked and answered in determining whether the Administration shall be continued in power. In other words—How has the Government been administered? Has it been economical and efficient? Has it aided or obstructed business prosperity? Has it made for progress in bettering the condition of the people, especially of the wage earner? Do its general policies and efforts recommend themselves to the common sense of the patriotic citizen?

Fortunately, by the victory won at Chicago the Republican party was saved intact for future usefulness, and it appeals to the public today, not upon visionary theories and dangerous promises, but clearly and definitely upon its past record and its long-established principles. It is not an uncertain substitute, but the same party thru which substantially all of the progress and the development of our country's history during the past fifty years has been effected. It is the party which carried the country thru the war and saved the Union, then thru the greenback and silver crazes to a sound gold basis, saving the country's honor and credit. It fought the Spanish war and successfully solved the problems of our new island possessions. It met the evils of the enormous trade expansion and combinations of capital and has made a successful crusade against the attempt of concentrated wealth to control the country's politics and its trade. It has made the railroads the servants and not the masters of the people. It has enforced the anti-trust laws until those who were bent upon monopolistic control are now acquiescent in any plan which shall give them opportunity for legitimate expansion. It has been alive to the modern duty of government by positive law to further equality of opportunity to the weaker members of society in their dealings with the stronger and more powerful, and the promotion of the comfort of the people.

The list of legislative enactments for the uplifting of those of our people suffering a disadvantage in their social and

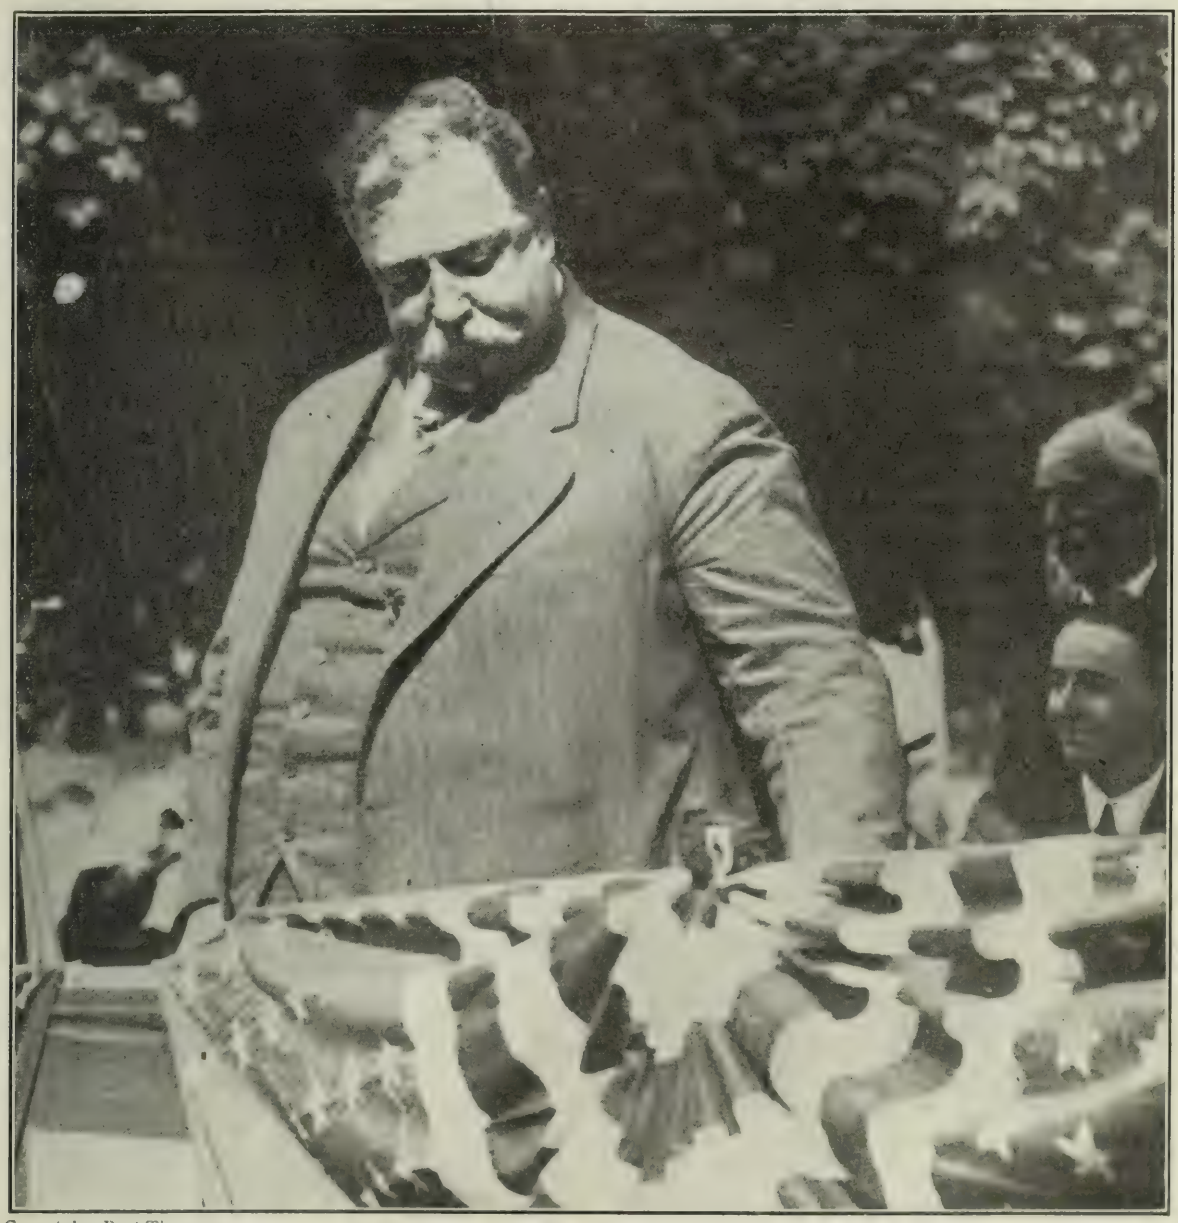
economic relations, thru this and former Republican administrations, is a long one and shows how sensitive the party is to the needs of the people. The pure-food law, the meat inspection law, the statutes requiring safety appliances and proper inspection on railways, checking the frightful loss of life and limb to railway employees, the establishment of the Federal Mining Bureau for the discovery of means for preventing the dangers of mining, the creation of the Children's Bureau, thru which the whole country will be made aware of the actual conditions in the States and of the best methods of reforming them, the increased pension provisions—in a substantial allowance which may properly be characterized as an old men's pension, the white-slave act, to save unfortunates from their own degradation, the railroad legislation by which shippers have been placed much nearer an equality with the railroads whose lines they use, and laws by which patrons of express, telegraph and telephone companies may now secure reasonable rates by complaint to the Interstate Commerce Commission, the millions appropriated annually to the great work of the Agricultural Department for the benefit of the farmer, the efforts of Congress to encourage the movement toward eight hours a day for all manual labor, the workmen's compensation act to save the employee the delay and expense of litigation, the postal savings

WILLIAM HOWARD TAFT

banks, and the parcels post are but a few of the efforts made by the Republican Administration to better the conditions of the poorer and the weaker and contribute to the comfort of living; and we are all in sympathy with every possible effort to remedy injustice and to aid the weak.

I venture to say that there is no national administration in which more real steps of progress have been taken than in the present one. But in so far as the plan for the satisfaction of unrest involves the promise of a millennium, a condition in which the rich shall be made reasonably poor and the poor reasonably rich, by law, that is chasing a phantom; that is holding out to those whose unrest we fear a dream, a vision of the impossible.

In the abuses of the last twenty years ill-gotten wealth has been concentrated in some undeserving hands. It is an incidental evil in the great expansive movement in the material progress of the world, and the best that can be done is to make sure that there shall be no recurrence of the evil. In this the Republican party has made great progress and reform during the present administration and is actively working along lines which will shortly result in still forther betterment. Anything more than this means socialism. Socialism means the taking away of the motive for acquisition, saving, energy, and enterprise. It means stagnation and retrogression. It destroys the mainspring of human action that has carried the world on and upward for two thousand years.



In rousing the people to the danger which threatened our civilization from the abuse of concentrated wealth the public imagination was wrought upon and a reign of sensational journalism and unjust and unprincipled muck-raking has followed in which great wrong has been done to some honest men. Demagogs have seized the opportunity further to inflame the public mind and have sought to turn the peculiar conditions to their advantage. This is an age in which by exaggerations of the defects of our present, unavoidable condition, by false charges of responsibility for it, by holding up to the feverish imagination of the less fortunate and the discontented the promise of an impossible Utopia, a condition of popular unrest has been produced. And new parties are being formed upon vague promises of a visionary panacea.

I do not say that the two gentlemen who now lead, one the Democratic party and the other the former Republicans who have left their party, in their attacks upon existing conditions and in their attempts to satisfy the popular unrest by promised remedies, are consciously embracing socialism; for they do not offer any definite legislation or policy by which the happy conditions they promise are to be brought about. But if their promises mean anything they lead directly to the appropriation of what belongs to one man, to another. Both those who have left the Republican party under the inspiration of their present leader, and the Democrats, under their candidate, are going in a direction they do not definitely know, toward an end they cannot definitely describe, with but one chief and clear object, and that is of acquiring power for their party by popular support thru the promise of a change for the better. They ask for a change in the Government so that the Government may be restored to the people, as if this had not been the people's Government ever since the beginning of the Constitution.

The Republican party refuses to make changes simply for the sake of a change, cultivating a popular hope that in the change something beneficial, undefined, will possibly take place. The Republican party believes it is possible in this world that the fruits of energy, courage, enterprise, attention to duty, work, thrift, providence, restraint of appetite and passion will still continue to have their reward; and that laziness, lack of attention, yielding to appetite and passion, dishonesty, and disloyalty will ultimately find their compensation. We do not believe in any way to avoid human injustice but by perfecting our laws for administering justice. Whenever we can see a statute which does not deprive any person of what is his and is going to help others we are in favor of it. We do not believe that the greatest good to the greatest number can be accomplished by minimizing the rewards of individual effort, or by infringing or destroying the right of property, which, next to the right of

liberty, has been the greatest civilizing institution of history.

The Republican party emphatically believes in progress, but it does not believe that a millennium can be reached by the sudden upheaval and change of all of our existing institutions which have been steadily making for progress and betterment for more than a century. The Republican party stands for the Constitution, with such amendments as new conditions when thoroly understood may require.

Copyright, Paul Thompson.

MR. TAFT SPEAKING

To say that this is not an issue of the present campaign is to deceive oneself. It is the supreme issue! The Democratic party and the Republicans who have left their party have made it so thru breaking away from the Constitution in the hope of securing the votes of those whom they first made restless and discontented. They have left the Republican party the sole nucleus of all public opinion which favors constant progress and development along safe and sane lines under the Constitution.

The record of the past four years is not only an indorsement of the foregoing, but it is also a record of unabated activity in broadening plans and facilities for further and more rapid progress in the future—plans which should not be set at naught, in November, thru the careless votes of those who have been rendered restless and dissatisfied by the specious arguments of men who, in their own interests, are seeking to overturn the Government.

During this Administration we have given special attention to the machinery of Government with a view to increasing its efficiency while reducing its cost. The first year, after careful examination, we cut some $50,000,000 from the original estimates, and this policy has been maintained thruout the Administration; with the result that the Treasury *deficit* of $58,735,000, which we found, July 1, 1909, was changed to a *surplus* of $47,234,000, July 1, 1911. I also secured an appropriation for the appointment of an Economy and Efficiency Commission which has now been working for two years on plans for the reorganization of Government departments.

The gigantic work upon the Panama Canal, involving the expenditure of some $40,000,000 annually, has been carried on without a scandal and with such efficiency, engineering and medical skill, as to command the admiration of the world. In our foreign relations we have maintained peace, everywhere, and sought to promote its continuance and permanence. To this end we negotiated broad treaties for the promotion of universal arbitration, but the Democratic minority in the Senate prevented the necessary two-thirds vote for their ratification. The pressure for intervention in Mexico has at times been great, but this Administration has been conscious that one hostile step would unite the conflicting parties against us and involve us in a war with the whole of Mexico costing millions of dollars, the loss of thousands of lives, and all of the subsequent problems which would arise after we found ourselves in armed possession. It is easy to arouse popular indignation over instances that have occurred. It is easy to take advantage of that indignation for the purpose of justifying aggressive action. It is easy to cultivate political support and popularity by a warlike and truculent policy; but with the experience which we had in the Philippines and in Cuba, no one with a sense of responsibility to the whole American people would involve them in the almost unending burden and the thankless task of intervention. I am very sure that the course of self-restraint which the Administration has pursued in respect to Mexico will vindicate itself—at least in the pages of history. I am glad to believe that there has been more peace in the Central American republics because of our mediations than ever before.

The dignity and effectiveness of the Government of the United States, together with our responsibility to protect Hawaii, Porto Rico, Alaska and the Philippines, as well as the maintenance of the Monroe Doctrine, demand the maintenance of an army and navy. The plan of the Republican party to maintain a navy in proportion to the growth of other navies of the world was thwarted by the Democratic House of Representatives.

The Philippines have had popular government and prosperity thru this Administration and under a continuance of the same policy will gradually fit themselves for self-government. Nothing will prevent the substantial progress toward the best results but the ill-advised policy proposed by the Democratic party.

The Republican platform of 1908 promised that the tariff should be revised in extra session. It did not say in specific words that the revision would be generally downward, but I construed it to mean that. The work has been subject to most vicious misrepresentation. It has now been in operation thirty-five months and the results have fully vindicated the statement that, while far from a perfect bill, it was an improvement; and under it our prosperity has increased. That bill also enabled me to appoint a Tariff Board to investigate each schedule with a view to obtaining accurate information which would enable Congress to adjust each schedule upon a scientific basis to prevent destructive competition from European countries from closing our mills and other sources of production. We are living on an economic basis established on principles of protection. A large part of our products depend for existence upon a rate of duty sufficient to save the producer from a foreign competition which would make the continuance of his business impossible. If Congress had had the benefit of the Tariff Board during the extra session the bill would have been better. The Tariff Board made valuable reports on wool and its manufactures and on cotton manufactures, and if the Republican party had controlled the House of Rep-

resentatives during the past year there would have been no difficulty in effecting a revision of the schedules which would have been just and adequate. But the Democrats presented to me for my signature a woolen bill and a cotton bill which, if allowed to become law, would have forced the transfer of the manufacture to England and Germany, doing incalculable damage to American laborers and American industries.

If the coming election should put the Democrats in complete control of all branches of the Government this single example would extend thruout all business, inevitably producing a recurrence of the hard times we experienced from 1890 to 1897. It is true the Democratic platform says that the change from protection to a revenue tariff should be made in a way not to injure industry, but that is utterly impossible.

It ought to be brought home to the people of the United States so clearly that he who runs can read that a change of economic policy, such as that which is deliberately proposed in the Democratic platform, would obliterate many of our manufacturing enterprises, would throw thousands upon thousands of our wage earners entirely out of employment, would seriously injure the home market which our farmers now enjoy for their products, would cripple or wreck the multitude of small dealers depending upon the prosperous laborer for patronage, and would produce a condition of suffering among the people that no reforming legislation could neutralize or mitigate.

The statement so widely circulated by our political opponents that the tariff is a chief factor in creating the high cost of living is absolutely not true. The increase in the cost of living is world-wide. In our own country the most notable increase in prices has been in the case of products where no duties are imposed, and in several instances where they were reduced or removed by the recent tariff act. No promise in any political platform can remedy this universal condition. If the rate of protection is higher than the difference between the cost of production at home and abroad, it tempts the manufacturer in that particular instance to secure a monopoly of the trade and increase his profits; but these instances can be and will be eradicated by the Republican party thru the aid of a Tariff Board.

Combination of capital in great enterprises should be encouraged if within the law, for every one must recognize that progress in modern business is by effective combination of the means of production to the point of greatest economy. It should be our purpose, therefore, to put large interstate business enterprises acting within the law on a basis of security by offering them a federal corporation law. But the prosecution of all persons reported to the Department of Justice to have violated the anti-trust law has been carried on in this Administration without fear or favor, and every one who has violated it, no matter how prominent or how great his influence, has been brought before the bar of the court, either in civil or criminal suit to answer the charge. It is to the political interest of some to sneer at the decrees against the American Tobacco Company and against the Standard Oil Company and the Administration has been condemned in the Democratic platform for consenting to a compromise in the Standard Oil case. There was absolutely no compromise. The division of the two trusts by the decrees into several companies was not expected to show immediate radical change in the business. It may take some years to show all of the benefits of the dissolution, but the limitations of the decrees in those two cases are so specific as to make altogether impossible a resumption of the old combination. The business public is at last convinced that the anti-trust law means something and that the policy of the Administration in enforcing it means something. My belief is that these decrees mark the beginning of a new era in industrial development; and the Republican party which has carried on the fight to this propitious point should be entrusted to continue it.

Thus it is sufficient for me to say that it is greatly in the interests of the whole people to maintain the solidarity of the Republican party for future usefulness and to continue it and its policies in control of the destinies of the nation. I cannot believe that the American people after careful scrutiny and the education of the campaign, during which they must

have been able to see thru the fog of misrepresentation and demagogery, will fail to recognize that the two great issues which are here presented to them are, first, whether we shall retain, on a sound and permanent basis, our constitutional form of government, with the independence of the judiciary as necessary to the preservation of those liberties that are the inheritance of centuries, and, second, whether we shall welcome the prosperity which is at our door by maintaining our present business basis and by the encouragement of business expansion and progress thru the legitimate use of capital.

I know that in this wide country there are many calling themselves Democrats who view with the same aversion as Republicans the propositions of change that are recklessly advanced to satisfy what is supposed to be a popular clamor. They are men who deprecate disturbances in business conditions and are yearning for that relief from demagogic agitations which is essential to the enjoyment by the whole people of the great prosperity which the good crops and our present conditions ought to bring us. To them I appeal as to all Republicans to join us in our earnest effort to avert the political and economic revolution and the business paralysis which a Republican defeat at this time will surely bring about. Such a misfortune will fall heavily on the wage earner, and we most earnestly hope that he will see his real interest and where his prosperity actually lies, will understand the shallowness of the attacks upon existing institutions, and the deceitfulness of promises of undefined benefit by undefined changes. If he does he will support the continuance of the Republican Administration. He will distinguish between the substance of performance and the fustian of vague promises. He will see that those who would deliberately stir up discontent and create hostility toward those who represent the real business prosperity of the country are only sowing dragon's teeth.

Who are the people? They are the weak and the strong, the poor and the rich, and many who are neither—the wage earner, the capitalist, the professional man, the merchant, the manufacturer, the storekeeper and the clerk, the railroad manager and the employee. They have yet to speak for themselves. They have not given into the hands of any one the mandate to speak for them. This is not the first campaign which the people have entered confused and misled and diverted from the truth and from a clear perception of their own real welfare by specious appeals to their prejudices. But the clarifying effect of a campaign of education, the pricking of the bubbles of demagogic promises have more than once brought them to an understanding of their real interests and to a rejection of the injurious nostrums which in the beginning of the campaign it was feared they might embrace and adopt. So, I believe, it will be in the present case. I have faith in the intelligence, the loyalty, the common sense of the American people, that their deliberate judgment as expressed in their ballots cast in November will show a prevailing majority in favor of the sound progress and real prosperity to be preserved upon a protective basis and under a true constitutional and representative government by the whole people only thru a continuance of the Republican Administration.

The real issue of the campaign is this: Shall the Republican Administration, with its long and magnificent record of new problems met and solved, of things done and statutes passed, be indorsed by the people? Shall the progress and prosperity of the whole country be maintained by a continuance in power of those who have accomplished it, and whose policies and principles have been tested and proven sound thru years of successful administration, or shall there be put in power a party the chief characteristic of which has been its search for new issues and sophistical theories for the purpose of creating unrest and catching votes, with but little regard for the practical results of their propositions and but small sense of responsibility to the real business and the labor interests of the whole country?

I believe that my countrymen can and will answer this question in the only way to secure for the nation the blessings of peace, prosperity and happiness which it now enjoys.

The Democratic Party's Appeal*

BY WOODROW WILSON

CANDIDATE OF THE DEMOCRATIC PARTY FOR THE PRESIDENCY OF THE UNITED STATES.

WHENEVER things are to be done in a new way, in response to a new popular impulse, in obedience to the great democratic traditions of the nation itself, it is to the Democratic party that the country naturally turns. It has been spoken of as the party of opposition, the party of protest, and its long, unbroken party history has been attributed to the fact that it did not attempt a constructive program, but was always critical and on the defensive, always harking back to ideals set up at the foundation of the government, to which it was never wholly possible for it to adjust its own actual policies. But, altho there have been times when this characterization of it would seem to have been justified by the fact, the history of the country abounds in instances when our great party showed itself constructive and aggressive, not protesting, but performing, not criticizing, but projecting great reforms. Other parties have tied themselves up to particular lines of action to which they presently became wholly subject, upon which they at length became dependent, but the Democratic party has remained free to act, free to take on the new elements of popular impulse, free to read new times in new terms.

Its freedom is now about to serve it in an extraordinary degree. Those who look about them see parties apparently breaking up; but if they will look closer what they will see is simply this, that men are turning away by the thousands from those courses of policy and of action to which the alliances and practices of the Republican party have at last bound the country as if with a grip of

*As compiled from his campaign speeches by his secretary.

iron. The free elements of thought in the country are asserting themselves with an extraordinary energy and majesty that must presently work profound changes and mark this as one of the most noteworthy eras of our politics. But they are not exerting themselves to destroy; they are exerting themselves, rather, to find means of co-operation and action. Some men among the Republican leaders see what it is necessary to do, but they are not numerous enough to dominate their party councils; they cannot turn or guide the great organization of their party in the direction of the desired reforms. The great mass of voters in the country perceive this. They are looking, therefore, with great expectation toward the Democratic party to see if it will now, at this critical juncture, prove true to its traditions and supply them with men and measures.

The Democratic party has always had the impulse of reform because it has always been based upon deep and fundamental sympathy with the interests of the people at large. It has now only to prove that its impulse can find expression in a wise and feasible program in order to capture both the imagination and the allegiance of the country. It is this power of self-renewal, this power of looking forward, this power of realizing the present and projecting itself into the future, that has kept it young and which must now make it the party of young men, the party to which those must resort who are coming for the first time into the activities of politics; with which those must ally themselves whose hopes are forming into purposes, whose impulses are framing themselves by sober thought into concrete judgments, who know what they want and are fast finding out by what means they can get what they want.

If we recount the items of the liberal program to which the country is now looking forward, it will be easy to see that it is already the program of that Democratic party. The first item of political program is that the machinery of political control must be put in the hands of the people. That means, translated into concrete terms, direct primaries, a short ballot, and, wherever necessary, the initiative, the referendum and the recall. These things are being desired and obtained, not by way of revolution, not even with a desire to effect any fundamental change in our governmental system, but for the purpose of recovering what seems to have been lost—the people's control of their own instruments, their right to exercise a free and constant choice in the management of their own affairs.

Another great item of the program is that the service rendered the people by the national government must be of a more extended sort and of a kind not only to protect it against monopoly, but also to facilitate its life. We are, therefore, in favor of postal savings banks and of a parcels post, and feel with some chagrin that we have lagged behind the other free nations of the world in establishing those manifestly useful and necessary instruments of our common life.

The revision of the tariff, of course, looms big and central in the program, because it is in the tariff schedules that half the monopolies of the country have found covert and protection and opportunity. We do not mean to strike at any essential economic arrangement, but we do mean to drive all beneficiaries of governmental policy into the open and demand of them by what principle of national advantage, as contrasted with selfish privilege, they enjoy the extraordinary assistance extended to them.

The regulation of corporations is hardly less significant and central. We have made many experiments in this difficult matter, and some of them have been crude and hurtful, but our thought is slowly clearing. We are beginning to see, for one thing, how public service corporations, at any rate, can be governed with great advantage to the public and without serious detriment to themselves, as undertakings of private capital. Experience is removing both prejudice and fear in this field, and it is likely that within the very near future we shall have settled down to some common, rational and effective policy. The regulation of corporations of other sorts lies intimately connected with the general question of monopoly, a question which ramifies in a thousand directions, but the intricate threads of which, we

are slowly beginning to perceive, constitute a decipherable pattern. Measures will here also frame themselves soberly enough as we think our way forward.

Again, there is the great question of conservation. We are not yet clear as to all the methods, but we are absolutely clear as to the principle and the intention and shall not be satisfied until we have found the way, not only to preserve our great national resources, but also to conserve the strength and health and energy of our people themselves by protection against wrongful forms of labor and by securing them against the myriad forms of harm which have come from the selfish uses of economic power.

Beyond all these waiting to be solved, lying as yet in the hinterland of party policy, lurks the great question of banking reform. The plain fact is that control of credit—at any rate of credit upon any large scale—is dangerously concentrated in this country. The large money resources of the country are not at the command of those who do not submit to the direction and domination of small groups of capitalists, who wish to keep the economic development of the country under their own eye and guidance. The great monopoly in this country is the money monopoly. So long as that exists our old variety and freedom and individual energy of development are

WOODROW WILSON AT SEA GIRT

out of the question. A great industrial nation is controlled by its system of credit. Our system of credit is concentrated. The growth of the nation, therefore, and all our activities are in the hands of a few men who, even if their action be honest and intended for the public interest, are necessarily concentrated upon the great undertakings in which their own money is involved and who necessarily, by very reason of their own limitations, chill and check and destroy genuine economic freedom. This is the greatest question of all, and to this statesmen must address themselves with an earnest determination to serve the long future and the true liberties of men.

I have said that the Democratic party is now to attempt constructive statesmanship. There are well known conditions which surround so great a task. In the first place it cannot be executed if attempted with inconsiderate haste. That is not constructive which is loosely or hastily put together. Its parts must be sound, and their combination must be true and vital. No man can in a moment put great policies together and reconstruct a whole order of life.

We must remember that the abuses we seek to remedy have come into existence as incidents of the great structure of industry we have built up. This structure is the work of our own hands; our own lives are involved in it. Reckless attacks upon it, destructive assaults against it, would jeopardize our own lives and disturb, it might be fatally, the very progress we seek to attain. It would be particularly fatal to any successful program to admit into our minds, as we pursue it, any spirit of revenge, any purpose to wreak our displeasure upon the persons and the institutions who now represent the abuses we deprecate and seek to destroy. I do not say these things because I feel that there is danger of vengeful action or of revolutionary haste, but merely because we ought always to recognize that it is of the very essence of constructive statesmanship that we should think and act temperately, wisely, justly, in the spirit of those who reconstruct and amend, not in the spirit of those who destroy and seek to build from the foundations again.

The American people are an eminently just and an intensely practical people. They do not wish to lay violent hands upon their own affairs, but they do claim the right to look them over with close and frank and fearless scrutiny from top to bottom; to look at them from within as well as from without, in their most intimate and private details, as well as in their obvious exterior proportions; and they do hold themselves at liberty, attacking one point at a time, to readjust, corect, purify, rearrange; not destroying or even injuring the elements, but filling their altered combination with a new spirit. This is the task of the Democratic party. It is the task of all statesmanship. It is a task which just at this particular juncture in our affairs looms particularly big. It is not ominous, but inviting; not alarming, but inspiriting. We should congratulate ourselves that we have an opportunity to take part in the true spirit of those who would serve a great country, in a task which may recover for America her old happiness and confidence, her old spirit of triumphant democracy.

The only way to settle the tariff question is for the good of the country and not for the good of anybody in particular. Link it with special interests; let special interests have the chief interest in it, and you cannot settle it and take it out of politics. But once apply the rule of general interest and you have taken it out of politics. The minute you make it a tariff for revenue you have taken it out of politics. Then you have got something to stand on. I am not saying that you must do this thing offhand, without considering all the vested interests that have been built up. That's a different question.

The tariff question is not now what it was a generation ago. There was a great deal to be said for the policy of protection. A generation and a half or two generations ago the men in favor of it defended it with the greatest success. They said: "It does not matter how high a tariff wall you build around the country, because here is a great continent with almost inexhaustible resources, in which the initiative will build up a great many enterprises of a great many kinds and a great many enterprises of the

same kind, and prices will be kept down by competition." One of the things the people do not realize is that we have exhibited one of the biggest experiments in business that have ever been set up. There was once free trade within the whole area of this great country, free trade between innumerable competitors, and it was reasonable to expect then, as the earlier advocates of protection did expect, as great men later constantly believed it was reasonable to expect, that prices would be kept down by internal competition. But prices are not now kept down by internal competition. I don't have to point out that the beneficiaries consulted with one another and said: "Now, is it really necessary that we should cut one another's throats? These gentlemen in Washington will build this wall as high as we want it built. Let's get together. If the law is too watchful, let us have an understanding. We are men of honor. We will keep our word of honor. We can form an arrangement by which we can determine, to a very considerable extent at any rate, the price of the raw material. We can, if we will, control the sources of the raw materials, by means *ad libitum*. We can buy mines we do not intend to use for a generation and keep them in our side pockets, and so we can cut out any automatic regulation of this kind, instead of having a price schedule that is not our own and in open competition with the market."

Do you realize the extent of the audacity of the men who created the protective system? They said, "We are going to see to it that nothing is done for the farmers," who at that time were producing the wealth of the nation, "and that everything is done for the men who have not yet produced any wealth at all"; and by this process of favoritism and subsidizing of one kind or another, direct or indirect, we have altered the natural planes of life in this country.

How does it happen that when immigrants come to this country from agricultural regions they do not go to the farms, but are caught in the meshes of our cities? For the same reason that the boys of the plow of our country have been turned away from the farms and into the factories. All the life-blood of the country is being drained from the farms into the factories. A great many of the morbid conditions of our society are due to this same excessive fostering of one side of national life at the expense of the other. We have stimulated manufacture so much that we have not a large enough market or the means of disposing of the surplus product. This nation calls itself a trading nation, and has the knowledge of other manufacturing nations as to foreign markets; but whenever we have to ship any goods we have to ship them under some other flag than the flag of the United States. How did it happen that we destroyed our own merchant marine, and were associated with the policy by which we taxed the stuff out of which ships were built? We could not build them, and so, as if by deliberation, we deprived ourselves of the carrying trade of the world, which, if we had kept on our original plan, we might have had almost to the exclusion of other nations. Now we are getting very much interested in foreign markets, but the foreign markets are not particularly interested in us. We have not been very polite; we have not encouraged the intercourse with foreign markets that we might have encouraged, and have obstructed the influence of competition abroad.

So these circumstances make the tariff question a new question; and yet the standpat Republican leaders remain unenlightened, uninformed, absolutely blind and stubborn. They don't know anything has happened. These gentlemen talk in the same phrases that were used thirty, forty and fifty years ago. One of the things they say is that they are the guardians of prosperity and that nothing but the protective system can bring us prosperity; and when you press them to define prosperity they will define it in terms of the bulk of business. One of their most delightful expositions of patriotic purpose is, We must have new industries; if we have not got them we must acquire them at any cost. Professor Taussing calls attention to the fact that in the debate in the Senate on the Aldrich bill, Mr. Aldrich said, in defense of a duty of 50 per cent. on some article, that he was just as willing to pay 300, 400 or 500 per cent., provid-

ed he could thereby bring that industry to this country. Mr. Aldrich's idea of prosperity is to get as many industries as possible established in this country at any price. Who pays the price, I would like to know? The consumer, of course; but rather the price is distributed in the readjustments of the whole economic system. It is impossible to find who pays it. If you could, you might make him mad. But the trouble is, you cannot convince anybody in particular that he is paying it. But we, let us say in general terms, are paying 50, 100, 200 or 300 per cent. in order that some gentlemen may set up, and make profit in, some business that ought not to be set up in America, because America does not offer the ideal conditions. And that is prosperity! I understand prosperity to be the abundant, intelligent, economic development of resources possessed by the country itself. That is prosperity! It is using the plow, engines, mills and water powers of this country just as you would use your own intellectual and physical resources. My prosperity consists in the best development of my powers. It does not consist in my loading my back with borrowed plumage that I have to pay something for and wear with an unaccustomed awkwardness. That is not prosperity. And by the same token they say you are making business, therefore you are making employment; and we must assume, we must still assume, that the American workingman is so ignorant, so unintelligent as to suppose they are doing it for his sake. I'd like to know how he ever got into the game? I'd like to know how many gentlemen voluntarily share the profits of production with their workingmen? I know how the workingmen got their share—they got it by saying they would not work until they did. That's the reason the heart of America really sympathizes with the combinations of labor; that's the only way they are going to prosper in what is a selfish game.

Now, what is the conclusion of the whole matter? There are three conclusions. In the first place, we have been doing this thing at a tremendous economic disturbance, artificially changing our whole plans of society, and I fear we will go on doing it at an enormous waste. Has this country really husbanded and used its resources properly? Hasn't it used them in a way disgracefully wasteful? Haven't we stopped working a mine the minute it began to be difficult to work? Haven't we stopped using them the minute our virgin properties seemed difficult to manipulate? Haven't we left scrap heaps everywhere? Haven't we left off taking care of our forests, the splendid trees, ripping and tearing everywhere we have gone? Hasn't our progress been marked by scenes of devastation; nothing looked to, nothing saved, nothing utilized to the utmost? The Government has made everybody pay this bill of wastefulness, and we have even gone to the extent of paying bills of the next generations. Don't you know the combinations bought up mines they do not intend to use while we are still alive, and we are paying the interest on what it cost them to buy those mines which the next generation is going to use Isn't there an enormous economic waste when every generation must not alone pay its own bills, but the next generation's bills? The whole thing is an extravagant mirage of philanthropy, and this economic waste has bred in us something that is contrary to our trade genius—a sort of indulgence of looseness, a method of imperfection.

In the second place, we have got ourselves in the habit of legislating for the few instead of for the many on an interesting theory that I am very fond of explaining.

The theory of the Republican party has been, if a few prosper, all will be given a share of their prosperity; if you make the great captains of industry rich, they will make the country rich. It isn't so, but we have been foolish enough to believe it sometimes. We have been foolish enough to settle national elections on the belief that it was so. We believed that factories would be shut up and some thousands of poor devils sent out of employment and that symptoms of distress would be established, when there was no genuine necessity for distress at all. Oh, the greed of these men, the indulgence, the eternal indulgence of selfishness! They will say you have paid

the bills for us and for our fathers, and you have got to pay them again or we will know the reason why. I don't feel any bitterness about this; all that is buried; but it is the fact that we should have been so put upon; that we should have been so innocent as to believe the incredible—which we could demonstrate as untrue, if we only took the pains and looked into the facts; what the consumers knew to be untrue at the very time they were patiently casting Republican ballots and made believe they thought it wise; this putting the advantages of legislation in the hands of the few at the constant service of the many; and the dream of America has been reversed, to a government for the privileged few and not for the many.

There is a quotation which we have been applauding nearly every Fourth of July, as I remember, but which we have not believed since I can remember. We have applied that quotation from the Virginia Bill of Rights and from one of Washington's addresses, in which he lays it down as a fundamental conception of American affairs, that when the people deem their government is not serving their interests they have a right to resume it into their own hands. Haven't you heard that before and haven't you applied it? Well, do you believe it? America has not acted upon that in my lifetime. That belief is merely intended to be engraved in golden letters upon some tablet of our memories and enshrined as a fragrant recollection.

Now, there is another thing that the tariff has done—it has reversed all our natural conceptions of government. The worst feature of protection is the demoralization of our political ideas. We have based government upon patronage and privilege instead of upon justice and equality. That's the cancer that eats at the hearts of all.

Now, what are we going to do? Are we going to turn revolutionists? Are we going to act as free traders? I wish I might hope that our grandchildren could indulge in free trade, but I am afraid even they cannot, because they have to pay the bills of the Federal Government. We have a Federal system of government, but it is wise, it is good housekeeping, it is good management to leave direct taxes, for the most part, to the State government, because they have current bills to pay. It is likely that for an indefinite period we shall have to pay our national bills by duties collected at the ports. Tho I am not for drastic changes, yet I wish I saw some ultimate escape from it. At present I do not. Therefore, what we have to ask ourselves is not the principle upon which we are to act, for that is plain. We are to act upon the fundamental principle of the Democratic party, not free trade, but tariff for revenue, and we have got to approach that by such avenues, by such stages, and at such a pace as will be consistent with the stability and safety of the business of the country. Fortunately, there are some things that are plain. The very wide-awake gentlemen who constitute the Democratic majority in the lower house of Congress saw the opening in the line and carried the ball thru. They saw the schedules upon which it was safe to act, and unanimously agreed that it was safe and wise to act now, which they did; and now they may have to act again to the same effect, because all excuses, so far as I can see, for any co-operation, are swept away. Many excuses were offered. The cover of the tariff bill was an excellent cover while it lasted, but the Tariff Board has uncovered the defense and now there are certain schedules upon which our minds are fixt, with a sufficient illumination of the facts and conditions to enable us to act upon them. We can act upon them, and feeling our way prudently here and there, not like doctrinaires but like practical and prudent men, we can by prudent stages bring this tariff down to our children on a proper tariff basis. That's a plain program. It is a practical man's program. It is not a theoretical program; it is not a program based upon patience that special privilege has exhausted; it is merely an open-minded, prudent, statesmanlike course of action.

The Progressive Party's Appeal*

BY THEODORE ROOSEVELT

CANDIDATE OF THE PROGRESSIVE PARTY FOR PRESIDENT OF THE UNITED STATES.

THE time is ripe for a genuine Progressive movement. We must put at the service of all our people the collective power of the people, thru their governmental agencies. We propose boldly to face the real and great questions of the day on a platform which is a contract with the people. If the people accept this platform by putting us in power we shall hold ourselves under honorable obligation to fulfill every promise it contains as loyally as if it were actually enforceable under the penalties of the law.

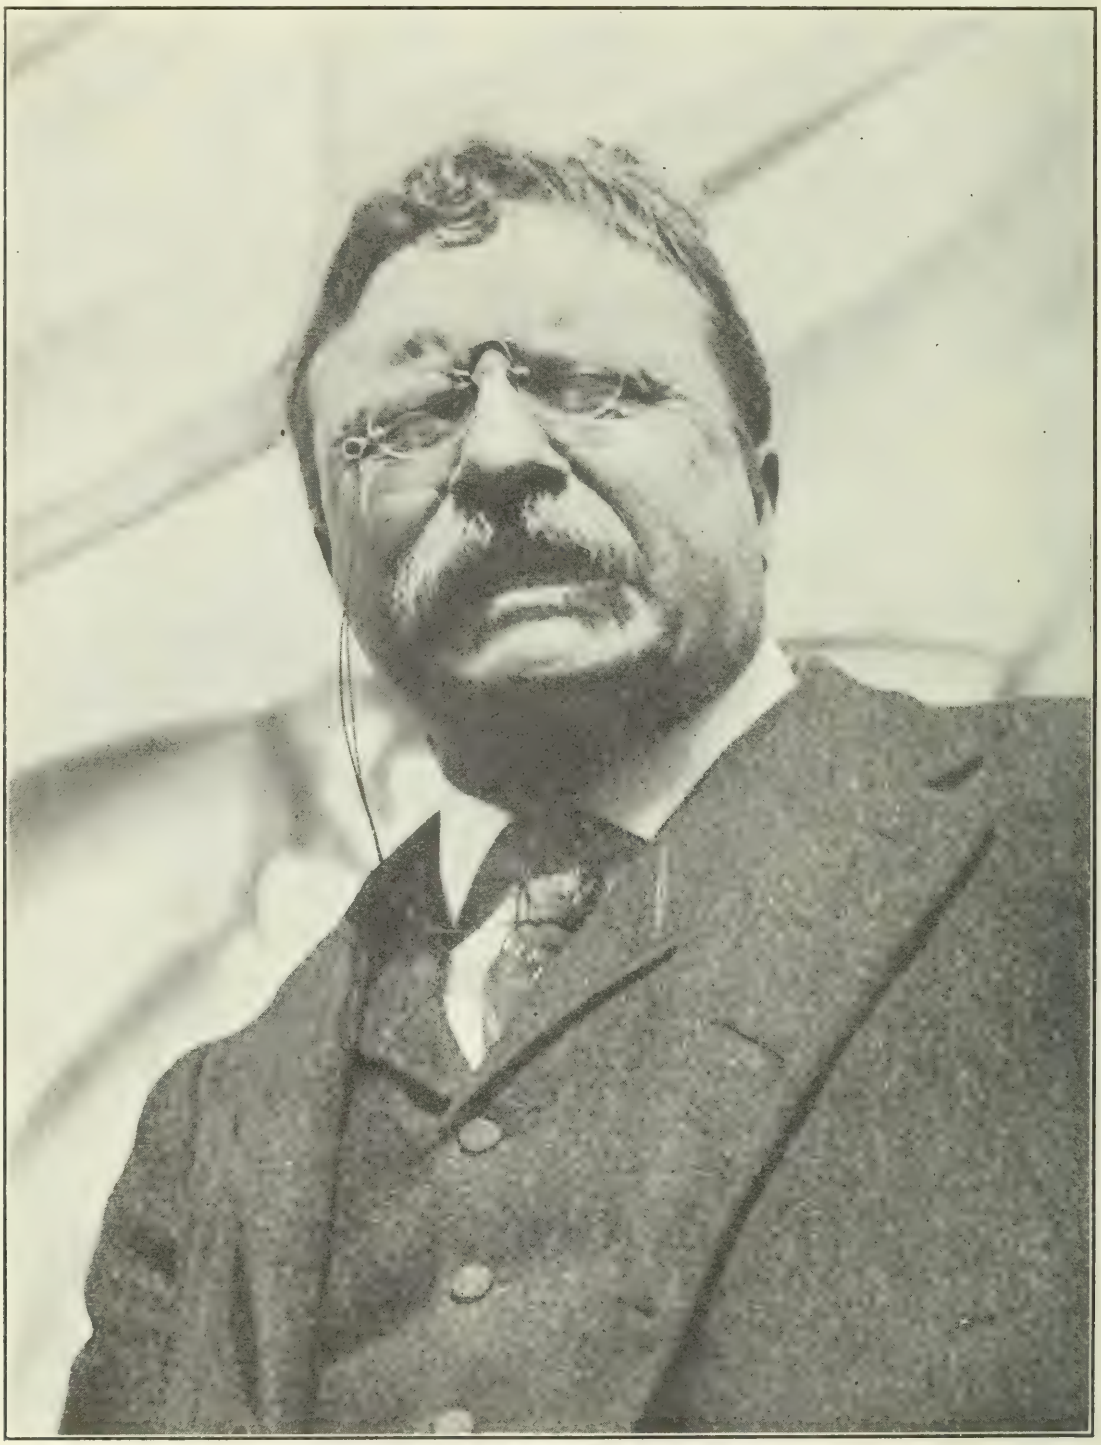
We are now in the midst of a great economic evolution. There is urgent necessity of applying both common sense and the highest ethical standard to this movement for better economic conditions among the mass of our people if we are to make it one of healthy evolution and not one of revolution. To do this we must break up old party organizations and obliterate the old cleavage lines on the dead issues inherited from fifty years ago. Our fight is a fundamental fight against both of the old corrupt party machines, for at present both the old parties are controlled by professional politicians in the interests of the privileged classes Our aim will be to use the government as an efficient agency for the practical betterment of social and economic conditions thruout the land.

We have founded a new party of nation-wide and non-sectional principles, a party where the titular national chiefs and the real State leaders shall be in general accord; a party in whose counsels the people shall be supreme; a party that shall represent in the nation and in the several States alike the same cause, the cause of human rights and of governmental efficiency.

The first essential in the Progressive party program is *the right of the people to rule.* We stand for woman suffrage, believing, as our platform declares, that "no people can justly claim to be a true democracy which denies political rights on account of sex, and we pledge ourselves to the task of securing equal suffrage to men and women alike." We stand for Presidential primaries; for the election of United States Senators by popular vote; for a short ballot; for stringent and efficient corrupt practices acts and publicity of campaign contributions during the campaign. We would provide thruout this Union for giving the people in every State the right really and not nominally to control their public service and their agencies for doing public business; wherever representative government has in actual effect become non-representative, there the people should secure for themselves the initiative, the referendum and the recall. I do not mean that we shall abandon representative government. My proposal is merely that we shall give to the people the power, to be used not wantonly but only in exceptional cases. The American people, and not the courts, are to determine their own fundamental policies. I deny that the American people have surrendered to any set of men the final right to determine those fundamental questions upon which free self-government ultimately depends. Means should be devised for making it easier than at present to get rid of an incompetent judge, and by the bar and the bench acting in conjunction with the various legislative bodies to make justice far more expeditious and more certain than at present.

The first charge on the industrial statesmanship of the day is to prevent human waste. In the last twenty years an increasing percentage of our people have come to depend on industry for their livelihood, so that today the wage workers in industry rank in importance side by side with the tillers of the soil. As a people we cannot afford to let citizens live or labor under conditions injurious to the common welfare. Industry, therefore, must submit to such public regulation as will make it a means of life and health.

The public has a right to complete knowledge of the facts of work. The



*As compiled from his campaign speeches by one of his supporters.

constituted authorities should be empowered to require all employers to file with them such wage scales and other data as the public element in industry demands. All tallies, scales and check systems should be open to inspection. All deaths, injuries and diseases due to industrial operation should be reported to public authorities. On the basis of these facts and with the recent discoveries of physicians and neurologists, engineers and economists, the public can formulate minimum occupational standards below which, demonstrably, work can be prosecuted only at a human deficit. Minimum wage commissions should be established in the nation and in each State to inquire into wages and determine the standards which the public ought to sanction as a minimum. There should be at once established minimum standards for the wages of women. We stand for the passage of legislation in the nation and in all States providing standards of com-

THEODORE ROOSEVELT

pensation for industrial accidents and death, and for diseases clearly due to the nature of conditions of industry, and we stand for the adoption by law of a fair standard of compensation for casualties resulting fatally which shall clearly fix the minimum compensation in all cases. We stand for a living wage. We hold that the night labor of women and children is abnormal and should be prohibited; that the employment of women over forty-eight hours per week is abnormal and should be prohibited; that the seven-day working week is abnormal, and that one day of rest in seven should be provided by law. We hold that the continuous industries, operating twenty-four hours out of twenty-four, are abnormal, and where, because of public necessity or of technical reasons (such as molten metal), the twenty-four hours must be divided into two shifts of twelve hours, or three shifts of eight hours, they should by law be divided

MR. ROOSEVELT CAMPAIGNING

into three of eight. Safety conditions are abnormal when, thru unguarded machinery, poisons, electrical voltage, or otherwise, the workers are subjected to unnecessary hazards of life and limb; all such occupations should come under governmental regulation and control. Home life is abnormal when tenement manufacture is carried on in the household. Temporary construction camps are abnormal homes and should be subjected to governmental sanitary regulation. The premature employment of children is abnormal and should be prohibited; so also the employment of women in manufacturing, commerce or other trades where work compels standing constantly; and also any employment of women in such trades for a period of at least eight weeks at time of childbirth. Our aim should be to secure conditions which will tend everywhere toward regular industry, and will do away with the necessity for rush periods followed by out-of-work seasons.

The welfare of the farmer is a basic need of this nation. The Country Life Commission should be revived with greatly increased powers. Everything possible should be done to better the economic condition of the farmer, and also to increase the social value of the life of the farmer, the farmer's wife and their children. The Government must cooperate with the farmer to make the farm more productive. Every invention and improvement, every discovery and economy, should be at the service of the farmer in the work of production; and, in addition, he should be helped to cooperate in business fashion with his fellows, so that the money paid by the consumer for the product of the soil shall to as large a degree as possible go into the pockets of the man who raised that product from the soil. Steps must be taken at once to put a stop to the tendency toward absentee landlordism and tenant farming. The question of rural banking and rural credits is also of immediate importance.

The present conditions of business cannot be accepted as satisfactory. We heartily approve of prosperity, no matter how great, of any man, if it comes as an incident to rendering service to the community. But we wish to shape conditions so that a greater number of the small men who are decent, industrious and energetic shall be able to succeed, and so that the big man who is dishonest shall not be allowed to succeed at all.

Our aim is to control business, not to strangle it. Our aim is to promote prosperity, and then see to its proper division. We wish to control big business so as to secure among other things good wages for the wage workers and reasonable prices for the consumers. Says President Van Hise, "concentration, cooperation and control are the keywords for a scientific solution for the mighty industrial problem which now confronts this nation."

We Progressives stand for the rights of the people. When these rights can best be secured by insistence upon States' rights, then we are for States' rights. When they can best be secured by insistence upon national rights, then we are for national rights. Interstate commerce can be effectively controlled only by the nation. There is no surer way to prevent all successful effort to deal with the trusts than to insist that they be dealt with by the States rather than by the nation, or to create a conflict between the States and the nation on the subject. The only effective way in which to regulate the trusts is thru the exercise of the collective power of our people as a whole thru the governmental agencies established by the Constitution.

It is utterly hopeless to attempt to control the trusts merely by the anti-trust law or by any law the same in principle, no matter what the modifications may be in detail. In the first place, these great corporations cannot possibly be controlled merely by a succession of lawsuits; the administrative branch of the Government must exercise such control.

While the anti-trust law should be kept on the statute books and strengthened to make it generally and thoroly effective against monopoly or anti-social practices, at the same time a National Industrial Commission should be created which should have complete power to regulate and control all great industrial concerns engaged in interstate business.

This commission should exercise over these industrial concerns like powers to those exercised over the railways by the

Interstate Commerce Commission, and over the national banks by the Controller of the Currency, and additional powers if found necessary. The establishment of such a commission would enable us to punish the individual rather than merely the corporation. This commission should deal with all the abuses of the trusts. It should have complete power to make the capitalization absolutely honest and put a stop to all stock watering. It should have free access to the books of each corporation and power to find out exactly how it treats its employees, its rivals and the general public. It should have power to compel the unsparing publicity of all the acts of any corporation which goes wrong. The regulation should be primarily under the administrative branch of the Government, and not by lawsuit. It should prohibit and effectually punish monopoly achieved thru wrong, and also actual wrongs done by industrial corporations which are not monopolies, such as the artificial raising of prices, the artificial restriction on productivity, the elimination of competition by unfair or predatory practices, and the like; leaving industrial organizations free within the limits of fair and honest dealing to promote thru the inherent efficiency of organization the power of the United States as a competitive nation among nations, and the greater abundance at home that will come to our people from that power wisely exercised.

The Progressive proposal is definite. It is practicable. We promise adequate control of all big business and the stern suppression of evils connected with big business, and this promise we can absolutely keep. Our proposal is to help honest business activity, however extended, and to see that it is rewarded with fair returns, so that there may be no oppression either of business men or of the common people. We propose to make it worth while for our business men to develop the most efficient business agencies for use in international trade. But we propose to make those business agencies do complete justice to our own people. Whenever it is practicable we propose to preserve competition, but where, under modern conditions, competition has been eliminated and cannot be successfully restored, then the Government must step in and itself supply the needed control on behalf of the people as a whole.

The tariff question should be approached from the standpoint of the interests of the whole people, and not as a bundle of preferences to be given to favored individuals. The American people desire a protective tariff primarily in the interest of the wage-worker and the consumer. The chief opposition to our tariff at the present moment comes from the general conviction that certain interests have been favored by overprotection.

It is not merely the tariff that should be revised, but the method of tariff making and of tariff administration. Wherever nowadays an industry is to be protected it should be on the theory that such protection will serve to keep up the wages and the standard of living of the wage-worker in that industry, with full regard for the interests of the consumer. To accomplish this, the tariff to be levied should as nearly as is scientifically possible approximate the differential between the cost of production at home and abroad. This differential is chiefly, if not wholly, in labor cost.

The first step in tariff reform should be the creation of a permanent commission of non-partisan experts whose business shall be to study scientifically all phases of tariff making and of tariff defects. As a further means of disrupting the old crooked, log-rolling method of tariff making, all future revisions of the tariff should be made schedule by schedule, as changing conditions may require. Under the Constitution, Congress is the tariff-making power. It should not be the purpose in creating a tariff commission to take anything away from this power of Congress, but rather to afford a wise means of giving to Congress the widest assistance possible, and of furnishing disinterested information.

We in this country are blessed with great natural resources, and our men and women have a very high standard of intelligence and of industrial capacity. We cannot permanently support conditions under which each family finds it increasingly difficult to secure the necessaries of life and a fair share of its com-

forts thru the earnings of its members. The cost of living in this country has risen during the last few years out of all proportion to the increase in the rate of most salaries and wages; the same situation confronts alike the majority of wage-workers, small business men, small professional men, the clerks, the doctors, clergymen. The problem is worldwide. No conditions have been shown which warrant us in believing that the abolition of a protective tariff as a whole would bring any substantial benefit to the consumer, while it would certainly cause unheard of immediate disaster to all wage-workers, all business men and all farmers, and in all probability would permanently lower the standard of living here.

It is also asserted that the trusts are responsible for the high cost of living. Trusts which increase production—unless they do it wastefully as in certain forms of mining and lumber—cannot permanently increase the cost of living; it is the trusts which limit production, or which, without limiting production, take advantage of the lack of governmental control, and eliminate competition by combining to control the market, that cause an increase.

There remain many other elements. Wrong taxation, including failure to tax swollen inheritances and unused land and other natural resources held for speculative purposes, is one of these elements. The tendency to leave the country for the town is another; the exhaustion of the soil and poor methods of raising and marketing the products of the soil make up another. Another element is that of waste and extravagance, individual and national. There are yet other elements. There should be a fearless, intelligent, searching inquiry into the whole subject by a non-partisan body of experts, with no prejudices to warp their minds, no objects to serve, who shall recommend any necessary remedy, heedless of what interests may be helped or hurt thereby.

We must conserve the soil, the forests, the mines. The public should not alienate its fee in the water power. Just as the nation has gone into the work of irrigation in the West, so it should go into the work of helping reclaim the swamp lands of the South. We should undertake the complete development and control of the Mississippi as a national work, just as we have undertaken the work of building the Panama Canal. In the West, the forests, the grazing lands, the reserves of every kind, should be so handled as to be in the interest of the actual settler, the actual home maker. Alaska should be developed at once, but in the interest of the actual settler. The Government should at once construct, own and operate the railways in Alaska. The Government should keep the fee of all the coal fields and allow them to be operated by lessees, with the condition in the lease that non-use shall operate as a forfeit.

In international affairs we should do no wrong to any nation, weak or strong, and we should submit to no wrong. Above all, we should never in any treaty make any promise which we do not intend in good faith to fulfil. I believe it essential that our small army should be kept at a high pitch of perfection, and that the navy should be steadily built up. The process of upbuilding must not be stopped until it proves possible to secure by international agreement a general reduction of armament.

The Panama Canal must be fortified. In time of war the canal would of course be open to our warships and closed to the warships of the nation with which we were engaged in hostilities. But at all times the canal should be opened on equal terms to the ships of all nations engaged in international commerce.

Surely there was never a fight better worth making than the one in which we are engaged. It matters little what befalls any one of us who for the time being stand in the forefront of the battle. I hope we shall win, and I believe that if we can wake the people to what the fight really means we shall win. But, win or lose, we shall not falter. Our cause is based on the eternal principles of righteousness; in the end the cause itself shall triumph.

We, here in America, hold in our hands the hope of the world, the fate of the coming years; and shame and disgrace will be ours if in our eyes the light of high resolve is dimmed, if we trail in the dust the golden hopes of men.

The Socialist Party's Appeal

BY EUGENE V. DEBS

CANDIDATE OF THE SOCIALIST PARTY FOR THE PRESIDENCY OF THE UNITED STATES.

FOR the first time in fifty years, or since the Civil War, a great moral question cleaves the political atmosphere of this nation.

Socialism indicts capitalism at the bar of civilization and challenges its political spokesmen of whatever name or brand to defend it.

The political struggle now on in this nation is a struggle to the death; either capitalism, with its gorgeous wealth and power for its successful devotees and owners, and its brutal, degrading struggle for existence for its workers, will write *"esto perpetua"* upon the scroll of Time and this civilization will enter eclipse and decline, as have the civilizations of every previous age, or else capitalism will surrender the scepter of power to socialism and the race will progress to hights undreamed and establish a civilization as far in advance of capitalism in its beneficence to mankind as capitalism is in advance of savagery.

The fundamental difference between the Socialist political organization of this and every other nation of earth and all other political organizations is in its *economic program.*

In this nation the politicians or statesmen of the Roosevelt, Taft, Wilson type, who are the chosen or self-appointed spokesmen for their respective political organizations, may have widely different convictions or opinions upon *political* issues, such as direct legislation, recall of public officials, including the judiciary, direct election of Senators, etc., *but upon economic questions affecting the present social order they are at one. They represent the capitalist system and they stand or fall with capitalism.*

The Socialist party and its chosen spokesmen, on the other hand, challenge the right of capitalism to longer exist, and they boldly proclaim the program of socialism as the legitimate successor of the present order.

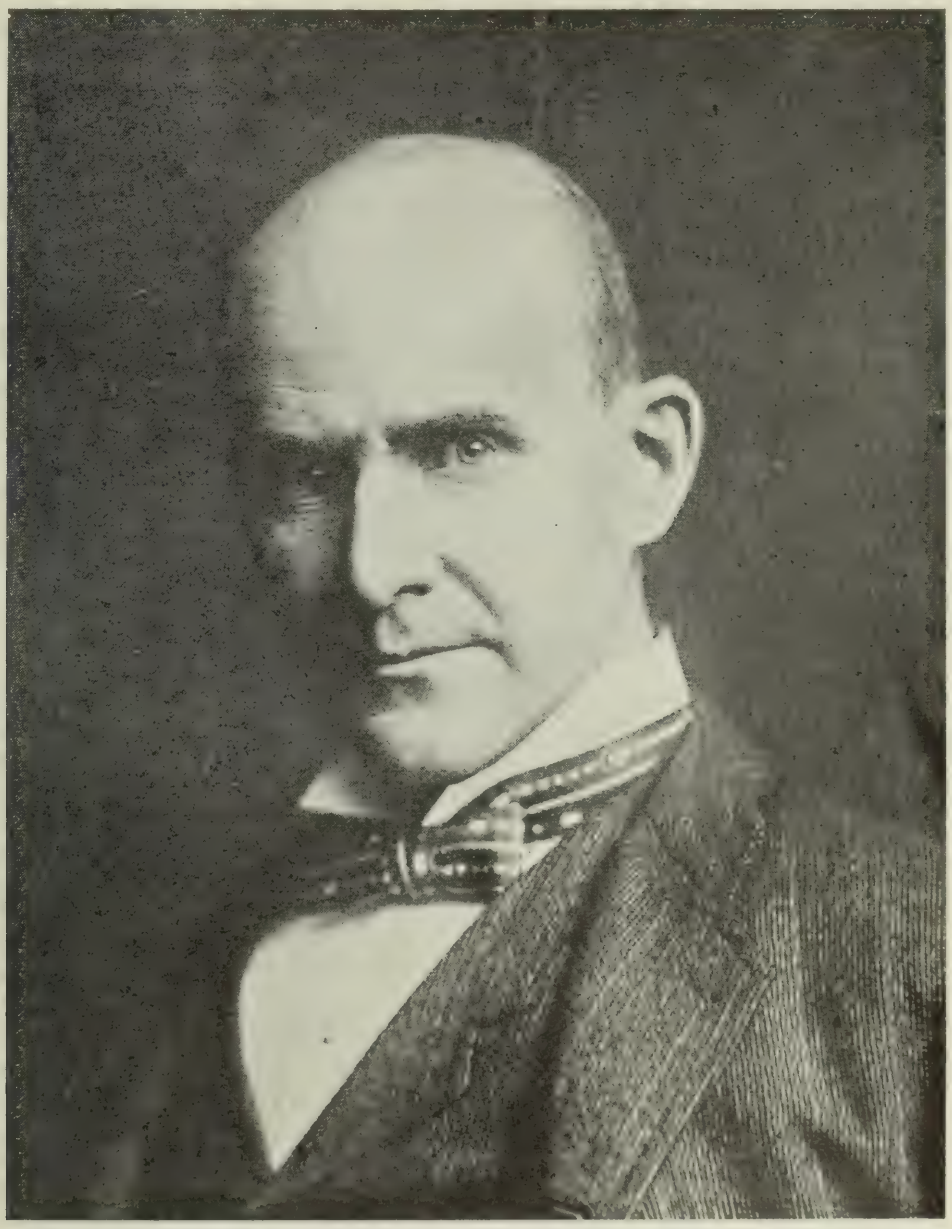
Again, socialism appeals to the world's workers upon the lines of their *class interests.* The Socialist nominees make no pretense of attempting to serve *both* capitalists and workers. That is a political sophistry which socialism leaves a monopoly in the hands of the political spokesmen for capitalism.

Socialism counts among the world's workers all those who labor with hand or brain in the production of life's necessities and luxuries. The services of a general manager of a great railway system, or the superintendent of a great department store, are quite as essential to modern civilization as are the section hand of the one or the delivery boy of the other, and the program of socialism appeals to the self-interest of every man and woman so employed. With the interests of the *owners* of the great machines of modern production and distribution the Socialists have no concern, *except to abolish that ownership and vest it in the public, thru legislation, municipal, State and national.*

Capitalism is founded upon production for *profit.* Socialism is postulated upon production for *use.* Whenever the owners of the world's machinery of production and distribution fail for any reason to realize profit, it is in their power to cease production or distribution and the world's workers may starve. Again, if the owners of the world's machinery of production and distribution permit it to be operated, they dictate the terms upon which the world's workers may use that machinery. In other words, the only function of the modern capitalist is to *own* that which his brother man must *use.* The worker has naught but his labor power, of hand or brain, to sell, and if he must sell his labor power upon terms dictated by another, *he is a slave.*

He who controls my bread controls my head, and so the contest between modern capitalism and socialism resolves itself into the age-old question of human slavery.

Upon this question the political forces



of this nation and the world are cleaving.

Deny it as they may, confuse it as they will, the spokesmen for the existing order are being slowly but surely driven to an admission of the Socialist indictment of capitalism.

The so-called progressive programs of the Democrats under Bryan and Wilson and the Republicans under Roosevelt are merely so many apologies for the crimes of capitalism. The standpat capitalists under the leadership of President Taft offer few apologies, but boldly take their stand for the existing order as it is.

The deplorable poverty of millions upon millions of workers in high tariff America, and a like condition existing in the ranks of the workers in free trade England, save the Socialists the necessity for wasting time upon this hoary but oft resurrected "issue" of capitalism. Whether under high or low tariff, in America or elsewhere, the worker and producer is exploited at the door of the factory or farm to the point of mere existence.

With the owners of the machinery of production and distribution in possession of *both the machinery and its product,* it matters little to them or to the workers whether wages be high or low, since thru manipulation of prices under capitalism the capitalists readily reduce the purchasing power of the workers' wages to the point of *subsistence, and that is*

THE VETERAN NOMINEE OF THE SOCIALIST PARTY

the point at which the world's workers always will exist under modern capitalism.

The present high cost of living can never be reduced without throwing capitalism into helpless bankruptcy; present prices are necessary in order to pay interest and dividends upon the monstrous capitalization of this age. The monumental capitalization, so huge in the aggregate as to stagger human imagination, represents the investments and the incomes of the owners of this nation. No capitalist politician, statesman or party dares lift a finger to reduce it, and it will continue to increase until the coming of socialism unless the entire machinery of capitalism breaks down previous to that time, bringing with it universal bankruptcy and a complete readjustment of our social and industrial system under capitalism. Such an eventuation is a possibility, but not a probability.

Control of corporations and the enforcement of the penal clauses of capitalist anti-trust legislation, by capitalist politicians, are twin frauds in the program of capitalism's efforts to fool the people.

The corporate wealth of this nation controls the capitalist government of this nation and will to the end of capitalism. Corporate wealth is the result of economic and industrial evolution. Until *corporate wealth* is supplanted by *common wealth* in the ownership of this nation, it will continue to write our laws and to enforce them or not, as best pleases its owners.

If it were possible to imprison the trust owners of this nation, it would have exactly the same effect upon economic evolution which has produced the trusts as the imprisonment of Galileo had upon the turning of the planets in their orbits.

But the Socialist wastes little time in expatiating upon these fleeting fantasies of the capitalist politicians. He realizes that the issues which divide the capitalist political camps are merely quarrels between rival groups of capitalists over the division of the spoils which they have expropriated from the workers. He is no more interested in the outcome of these political quarrels than he would be in the result of a quarrel between two hold-up men who had robbed him of his purse and who had fallen out over a division of its contents.

The Socialist contents himself with sticking to his political text. The monumental corruption, the hypocrisy and the shams of capitalist politics he sets down as one of the counts in his indictment of capitalism. Beside it he places the inexcusable impoverishment of his brother workers, the prostitution of his sisters, the destruction of his wife and children in the mines and sweatshops of capitalism.

The Socialist calls upon his brother worker to join him in the overthrow of capitalism thru capturing the powers of government and legally transferring the ownership of the world from capitalism to socialism.

He points out the staggering burden of militarism, the colossal fraud of capitalist courts, the indescribable corruption of capitalist business, the cant, the chicanery and the hypocrisy of capitalist society, and he urges his brother worker to join him in the struggle to usher in a better day.

For the first time in the world's history a subject class has it in its own power to accomplish its own emancipation without an appeal to brute force.

This is the appeal which socialism makes to the workers of this nation and the world.

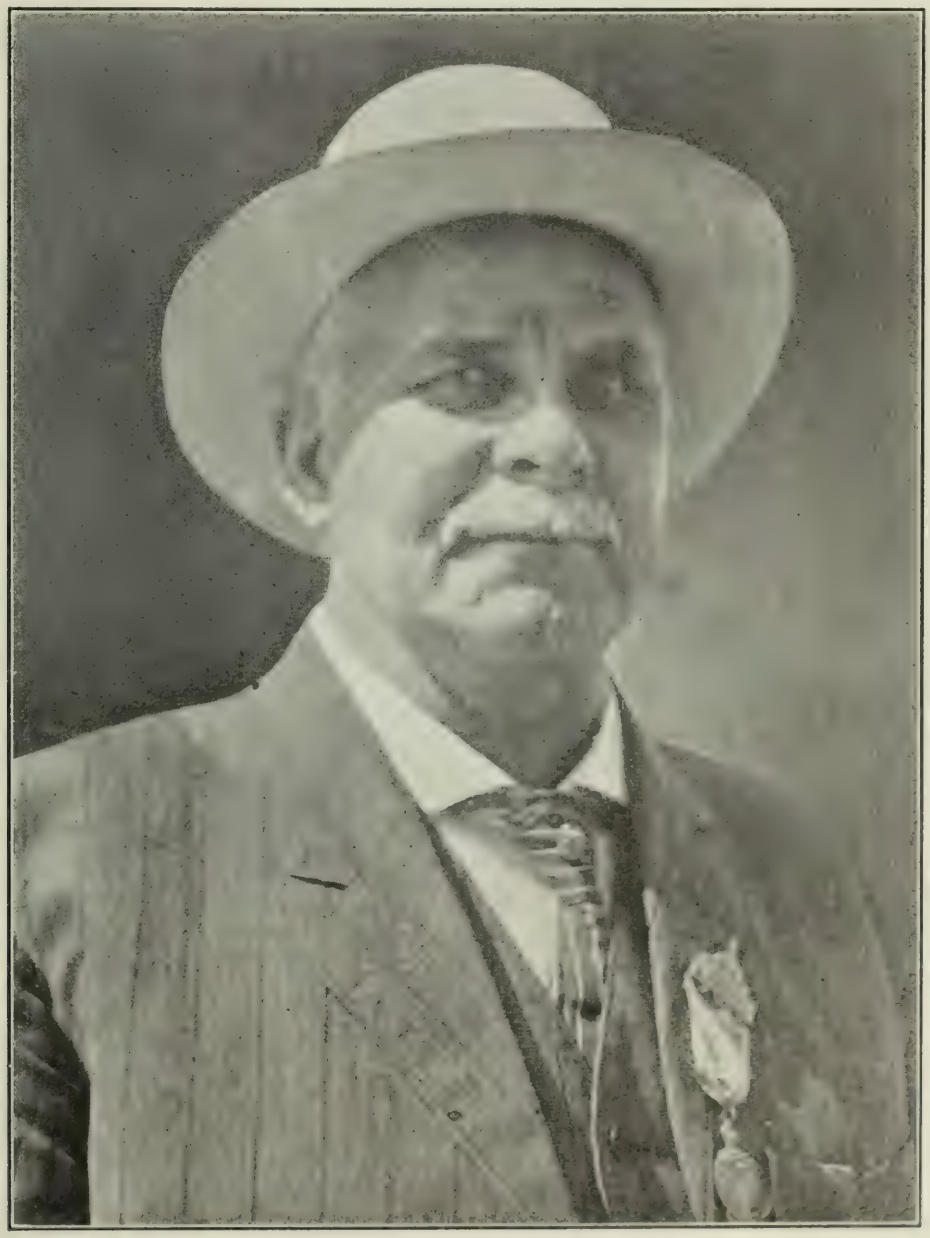
It invites them to seize political power in the name of the working class, and to legally write their own economic emancipation proclamation.

Under this invitation the nations of the earth, including our own, are seething with political revolt.

It is the sure precursor of mighty changes, political, social and economic, thruout the world.

TERRE HAUTE, IND.

The Prohibition Party's Appeal



BY EUGENE W. CHAFIN

CANDIDATE OF THE PROHIBITION PARTY FOR THE PRESIDENCY OF THE UNITED STATES.

THERE are many reasons why the Prohibition ticket should be victorious at the coming national election.

The greatest of all reasons is that we are the only party which, if elected to power, will prohibit the manufacture of liquor by national legislation in every inch of territory under the American flag. The solution of the liquor problem will also solve many other problems in American government. It will solve the problem of good government for our great cities, which are now ruled by the saloon vote.

It will also solve the problem of the high cost of living. There are nearly one million men engaged in making, distributing and selling liquor. These, together with their families, make an army of nearly five millions of people who produce no wealth, but are in the class of consumers only. As a result of this traffic we have those who are in jails,

EUGENE W. CHAFIN

penitentiaries, insane hospitals, poor houses and other places, who are sent there because of the liquor traffic, together with officers and attendants, which makes another army of more than five millions of people. Thus we have more than ten millions of people in this country who, as a result of the liquor traffic, produce neither food, clothing or shelter, the necessaries of life. More than one hundred and six millions (106,000,000) of bushels of grain are destroyed each year in the making of intoxicating liquors. If this grain could be turned into food and these ten millions of consumers transferred to the army of consumers *and* producers, it would solve the problem of the high cost of living.

There is but one solution of these problems and that is the election to power of the Prohibition Party, which will administer the government and interpret the Constitution and laws from the standpoint of making the manufacture and selling of liquors a *crime* and not a *business*. No relief can come to the people by the election of any one of the other parties now asking for the suffrages of our people.

TUCSON, ARIZ.

The Socialist Labor Party's Appeal

BY ARTHUR ELMER REIMER

CANDIDATE OF THE SOCIALIST LABOR PARTY FOR THE PRESIDENCY OF THE UNITED STATES.

TIME was when the Socialist was spoken of as a man who rocked a boat and said there was a storm. That time is no more. Not since the days when the old Roman Empire, long undermined, took a header toward dissolution and reconstruction has a society witnessed the spectacle of such universal unrest, irritation, discord and "high words," accentuated by the shrill notes of the storm hawk of anarchy, as is presented today upon the vast political stage of the United States.

For all this there is no hopeless chaos. Thru the thick dust raised by the universal clash, the lines are perceptible that distinguish the diverse social currents.

In the state of social statics, however bitter the outburst of feuds among the ruling sections of a commonweal, the menace of social dissolution is absent. It is otherwise at the transition stage of dynamics. At that stage the menace of the dissolution of the social bonds leaps up hideously—and, then, rough hewn tho class tactics may be, that menace shapes ruling class strategy.

Centering in the slums of our society, and ramifying upward to the Beckers in police departments, to the Lorimers in legislatures, to the Archbalds and Hanfords on judiciaries, to the Harry Thaws in millionaire circles, the cancer of dissolution of the social bonds that make society possible is on the rampage at the nation's vitals. At one end of the line the terms "friendship," "personal integrity," "respect for womanhood," "social safety," "public spirit" are being soberly twisted awry from their structural sense to individual purposes; at the other end of the line—as exemplified by the set with headquarters at Chicago which sails under the false colors of "Industrial Workers of the World"—individual appropriation, theft, is raised to the category of the rational sociologic principle of class expropriation by society thru the working class; individual deeds of mischief, such as "sabotage," and even murder, are pointedly suggested in print as methods of "warfare"; fraud is glorified as "tactics"; and to "strike at the ballot-box with an axe" is interpreted as "political action." From one end of the line to the other, the apparition is that of gaunt, rawboned anarchy—the bankruptcy of the moral sense; the dissolution of all social bonds.

In sight of the dread apparition, society, instinctively alarmed for its safety, ever flies to the other extreme—

absolutism. The move ever proceeds from the ruling class. The historic phenomenon reappears in the present campaign in the two banners that have been unfurled over the camp of the Republican Party—the banners of Taft and of Roosevelt.

Bitter tho these two standard-bearers may be toward each other, they represent not merely and broadly the identical principle of capitalist class rule; they also, and specifically, represent the identical prescription—"absolutism"—to save society at the present crisis. The terse sentences with which Woodrow Wilson addressed his Nashville, Tenn., audience on last February 24 denote that neither is he in the dark upon this head:

"Don't deceive yourself by supposing all the people in this country believe in democratic government, because they do not. You have only to listen to the utterances of very distinguished Republican speakers to see that they do not believe and do not pretend to believe in popular government. They will tell you they do not believe the judgment of the people can be trusted."

ARTHUR ELMER REIMER

Nevertheless, at one tho they be as to the prescription—"absolutism"—the two Republican spokesmen differ seriously upon the method of administering the same. The method of the one is the gum-shoe of theocracy; the method of the other is the rattle of the spurs of the man on horseback.

Neither have I space, nor should it be

necessary, here to pass in review the cumulative evidence of the systematic endeavor on the part of the Roman Catholic political hierarchy—ambushed behind religion, and in league with kindred spirits Jewish, Protestant and Atheist—to revolutionize the country backward to the theocratic social system of the Dark Ages; nor have I space, nor should it be necesary, here to recite the recently multiplying proofs that President Taft has been chosen as and has accepted the historic function of a twentieth century makeshift for the fourth century Constantine to place ultramontane theocracy in the political saddle of the land. On the other hand, neither have I space, nor should it be necessary, here to recapitulate the long list of events which—beginning with his exploits as police commissioner of the city of New York, continued almost to the last act of his Presidential term, the abortive attempt to Cromwellize the Federal House of Representatives, and prolonged by utterances unnumbered since his return from Africa—expose the absolutistic convictions both of Roosevelt and of his plutocratic as well as slum Rough Riding admirers.

With all the respect due to Woodrow Wilson, whose scholarly personality colors the Democratic party in this campaign, I must award to Hamlet the palm for wariness. Hamlet, perceiving his household to be out of joint, cursed the spite that called on him to set it right. With less wariness, Woodrow Wilson, perceiving his capitalist household to be out of joint, quixotically tackles the problem to set the smash-up right.

Whence does the flood of anarchy—governmental and slum—proceed? Surely not from the clouds; and Woodrow Wilson is too intelligent a man to impute the phenomenon simply to human depravity. Woodrow Wilson admits that today "opportunity is double-bolted." Legislation may tighten the bolt, or loosen it, and the door may be set ajar—but nevermore, under capitalism, thrown wide open again. Further economic evolution will reclose the door, and redouble-bolt opportunity. Where the social system starts with the private ownership of the necessaries for production, the bolt that, at first, slightly impedes fatedly becomes in the end a total bar to "opportunity"—so far as the masses are concerned. The chains of wage slavery become more galling; the precariousness of existence sets widening areas of the population under its ban; labor reacquires the biblical stigma of a curse; to escape the same governmental coruption, manifold crime, anarchy, in short, becomes the asylum of increasing numbers. At such a stage of capitalist rotten-ripeness, to look for reformatory redress in the governmental and economic maxims that rocked the cradle of the green infancy of capitalism is to be blind to economic evolution. It is to seek to hold back a runaway horse by the tail. Vastly more sagacious is the absolutists' proposition of insinuating or forcing a sharp-toothed curbing bit into the mouth of the runaway. Even under the chieftainship of the scholarly Woodrow Wilson the Democratic party of our generation makes good its reputation for "seeing events only after they have happened"—with Hamlet's fate as its reward.

Capitalism has organized the forces for and firmly sunk the piers on which to rear the structure of the industrial republic—the social system under which the plants of production are owned collectively and democratically administered. That way social evolution points, pushes and pulls. Around a banner with "Socialism" blazoned on its folds, a globe-encircling movement for human freedom and physical well-being is under way—a movement never before practical because never before was the material basis therefor at hand. The Socialist propaganda which that movement trumpets is a bold, at once destructive and constructive doctrine that needs for its triumph the *oneness* of purpose of its votaries, and *men* behind its vote. With a purpose equal to that of the Taft, Roosevelt and Woodrow Wilson parties, in point of sincerity and error, the Socialist party visionarily expects to encompass the triumph of Socialism by rendering the name of Socialism fly-paperly "attractive to the vote of discontent," and realizes not that that way lies a social cataclysm.

Socialism may be summed up in the

motto, "Down with the political state, up with the industrial administration!" To general and to cultivated ignorance the motto savors of the anarch's "No government!"—afraid, on the one hand, to alienate the vote of the "furtive Socialists" by a propaganda which these may mistake for anarchism, the Socialist party suppresses this vital revolutionary feature of socialism; on the other hand, afraid to forfeit the vote of floating, hence anarchistically tainted discontent, the Socialist party has elected a notorious anarchist to its national executive committee.

Socialist economics teach that the wage, that is, the purchasing power in money which the working class receives, depends upon the supply of labor in the labor market, and that the wage is bound to decline because the supply is bound to increase, owing to the otherwise desirable concentration of the plants of production and the otherwise still more desirable perfection of mechanical appliances. Socialism proves that, as a consequence, taxes come out of that portion of the workingmen's product that never reaches their pockets, it being plundered by the capitalist class in the shops of production, distribution and communication. Socialism, accordingly, establishes the pregnant fact—a fact necessary for the reconstruction of society—that the working class pays no taxes. Afraid, on the one hand, to lose the vote of workingmen by a propaganda that runs counter to a popular economic delusion, the Socialist party declares that "taxes are paid by the workers," and thereby palsies its striking arm; on the other hand, afraid lest the vote of the tax-paying, petty-bourgeoisie slip thru its fingers, Socialist party literature advances the derailing tenet that taxation is shifted upon "the assessable property of the workers"—a class the badge of which is to be stript of property—a class that has no property to assess, and that the petty bourgeoisie claims to be of.

Socialism warns that, under the cloak of religion, affluent financial, real estate and political bodies escape their share of the burden of government, thereby adding financial grease to the capitalist elbow of their pernicious duplicity. Afraid to seem to be afraid to be considered reactionary, the Socialist party one moment demands the taxation of all church property and the next moment, afraid to lose this or that creed vote, takes backwater with a general clause, which, read by the light of the debate that brought the clause about, may mean whatever is suitable to the vote-catching purpose, according to the occasion.

The overthrow of the political state, and the substitution of the industrial régime, implies the previous organization of the useful ocupations of the land. This previous organization is all-essential. It at once furnishes the *transitory* weapon of the requisite physical force—the class-conscious union—whereby to supplement the revolutionary ballot, and the *permanent* structure of future society, the constituencies of the industrial or Socialist republic. Afraid to scare away the "labor vote" that gravitates toward Socialism, but that reactionarily clings to the civic federation and the militia of Christ; hoping to escape entangling itself in "labor disputes"; and fatuously imagining a party of Socialism could accomplish the miracle, the Socialist party muffles the most important drum in the orchestra of Socialist agitation, education and organization.

Socialist economics teach that the wage of the working class is bound to decline owing to the fated increase of the supply of labor in the labor market, brought on by capitalist development. Of course, immigration does not tend to depress the supply—on the contrary. Nevertheless, an anti-immigration posture is fatal to the solidification of the workers. The anti-immigration posture at once turns the workers' faces from the nerve that aches—the private ownership of the necessaries for work—and it ruptures the class solidarity of the proletariat by quickening the latent superstitions of racial vanities. Afraid to estrange the vote of error-born jingoism, the Socialist party renders a shame-faced homage to the capitalist-born and machiavellic policy of rupturing labor's ranks with echoes of nativistic superstition.

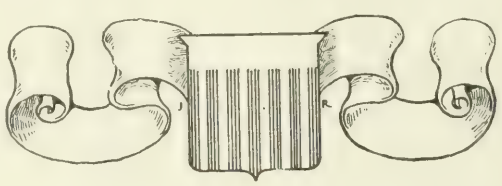
And so forth, all along the line, a true word creeping in here and there as contraband.

The healthiest of meats attracts flies; so much more does carrion. Altho the flies of impure elements will flock thickest upon the carrion of error, nevertheless, to overlook the circumstance that the social flies would have no standing ground, hence no opportunity for mischief, but for the honesty of the social error upon which they alight, would be wofully to miss the point. Leaving, accordingly, such "flies" aside as negligible and as only disturbing, but not essential factors in the consideration of the political parties that I have passed in review—

The Socialist Labor party rings the note of warning against the Taft Republican party of ultramontane theocratic absolutism. Even four hundred years ago economic development was far enough advanced to cast off the incubus, altho at the price of a long and devastating war. Twentieth century enlightenment will not brook the social monstrosity. The Taft Republican party menaces the land with a repetition, in America, of the Thirty Years War of Europe.

The Socialist Labor party rings the note of warning against the Roosevelt Republican party of mailed-hand absolutism. Dearly did France pay when the absolutism of Napoleon III threw her back upon her haunches. A similar check upon American progress is threatened by the apparition of our own would-be Napoleon the Little.

The Socialist Labor party rings the note of warning against the Democratic party. In the literal sense of the word "absurdity"—such answer as comes from the deaf—the program of Woodrow Wilson is absurd. It is not responsive to the huge socio-political interrogation mark of our age, particularly in our own country. At best it is a "pious wish," or a "motion to defer action."



The Socialist Labor party rings the note of warning against the party named "Socialist." Success, at the polls, of drag-netted forces spells bankruptcy after the polls close. The triumph of *un*-schooled "discontent," much more so when *mis*-schooled, only raises the crop of mutually destroying beings produced by the sown dragon's teeth told of in the mythologic parable. That way lies massacre for the proletariat, with their bleaching bones as pavement for absolutism to trample over into power.

The problem that addresses itself to this generation brings up the great issue of all ages since the rupture of society into classes, and the consequent rise of political government. The issue is brought strongest, because clearest, to America, where Socialism confronts capitalism, both clip and clear. Upon our people devolves the duty, as theirs will be the glory, of giving the signal to all others for economic freedom, the end of class rule, the downfall of political government, the rise of the industrial republic. Translated into modern idiom, the issue is "the unconditional surrender of the capitalist class"—nothing more, because, that goal once attained, mankind is free at last; nothing less, because the demand of the hour is not for half measures.

Upon these principles the Socialist Labor party—14,000 strong four years ago, 34,000 strong two years later—plants itself, challenging refutation, and conscious of ascendancy. Toward their promotion the S. L. P. unfurls its banner.

In the words of Martin Luther—using them as a historic utterance, made by a historic personage, at a historic juncture in the annals of man—"Here we stand, we can no otherwise!"

St. Paul, Minn.

Literature

Spirits Imprisoned

In tragedy there is no emotion so poignant as that of souls within cages, fretting spirits which beat their wings against the bars of circumstance.

The spirit of imaginative youth struggling against the ordering of a well intentioned conventional mind has given E. Temple Thurston the subject of *The Antagonists*.[1] It is a definite story with none of the author's usual interludes, which, delightful as they are, detract from the main issue; and it is charmingly told, with full understanding and a restrained strength.

An imaginative boy, son of a governess and an ex-butler, now a miller, has within him the tenderest feeling for art. The father does not understand—that is the tragedy of it—and maps out a commercial career. The lovable child awakens to a knowledge of the mystery of life, hastened by a precocious love affair with a designing woman of twenty-nine. The boy knows that he cannot be anything but a painter. Then he is enfolded by the passionate love of a girl whose childish playmate he has been. His father, the mother now dead, cannot understand his son's innocent plea for early marriage that he may be saved from himself. Then the boy breaks forth of his prison, takes his fate into his hands, and runs away to London.

"We all be in the same boat—three old maids, an' rowin' ter nowhere," says the old servant of the Misses Budd and Peacock in Mrs. Henry Dudeney's latest novel, *Maids' Money*.[2] Truly they are in a cage with the imp of the perverse leering outside. Two spinster cousins, a governess and a mother's help, have their days of struggle, as they fancy, terminated by the bequest of a country house and a comfortable income. But there is a sting to their joy. They must live together in the house; they may leave it only for a month in the year, but still remain in company; if one marries the other gets everything. What an idea for a farce! In Mrs. Dudeney's hands it becomes a gripping tragedy.

Constant companionship breeds dislike, contempt and finally hate, hate so terrible that one prays for the death of the other. The prayer is answered, and remorse comes to stay her happiness with the man she might have married. For two men came wooing the cousins, a dreamy penniless insurance clerk with an inventive crank, and a slovenly money-seeking doctor. There are really only four people in this story, but each stands out clearly and consistently. It is a novel of ripe reflection, careful in analysis, full of humor that bites; and it carries the reader along in the slow current of its tragic action to the inevitable and final plunge into darkness.

Why Should We Change Our Form of Government? Studies in Practical Politics. By Nicholas Murray Butler. New York: Charles Scribner's Sons. $1.

This is a collection of half a dozen addresses which were delivered on various occasions in the past five years and which bear directly upon the question propounded in the title. As a controversialist President Butler has conspicuous merits. In the field of politics there are very few American writers who manage to discuss complicated questions with such a combination of vigor and lucidity. Bitterly opposed to the socialistic tendencies of the time and to the growing impatience with constitutional restrictions, he has restated the old doctrines boldly and given us what is probably the most effective popular apology for the conservative position. His arguments are based upon broad considerations. He maintains that the initiative and referendum, which would overthrow representative government and destroy the fundamental guarantee of civil liberty, are reactionary as well as revolutionary; for political advancement, like all evolutionary processes, is marked by differentiation of function. Direct democracy,

[1] The Antagonists. *By E. Temple Thurston.* New York: D. Appleton & Co. $1.30.

[2] Maids' Money. *By Mrs. Henry Dudeney.* New York: Duffield & Co. $1.25.

like the amœba, is a primitive form. Now, such an argument is open to grave objection. Is it not fantastic to say that the initiative and referendum will change the form of our government? Certainly experience in Oregon has shown no weakening of the legislature; and that sinister group of radicals known as the People's Power League has been trying to secure annual sessions and a six-year mandate for the members! Curiously President Butler is heartily in favor of maintaining the judicial veto, which would appear to impair the responsibility of legislators and the alertness of citizens in watching votes at Albany or Harrisburg. The tone of the book is too pessimistic about the present and too reverential toward the past. If "our politics has become sadly commercialized," it is well to remember such incidents as the Yazoo frauds and the warning of Professor Ford that there has never been a golden age of political purity in this country. If we are now "condemned to the mediocre and second-rate . . . whose only claim to eminence is the magnitude of their thirst for office," should it be seriously implied that Webster did not thirst for office, or John C. Calhoun? And as for those constitutional debates whose absence is bemoaned, did any good ever come out of them? Was any important constitutional question settled by talking? And was Webster sounder on the tariff before or after the economic interests of New England had converted him? It will be seen—to put it mildly—that our author is not "glowing with the memory of tomorrow afternoon." The definiteness of his views and the admirable expression which he gives to them should make the little book something in the nature of a gospel for the friends of the old order.

Woman Adrift. By Harold Owen. New York: E. P. Dutton & Co. $1.50.

Woman Adrift is probably the ablest book yet written against woman suffrage, and, as such, deserves a notice to which on other grounds it could scarcely lay claim. But among pygmies a man of middle hight appears gigantic, and an anti-suffrage book which develops a clear and consistent line of argument, has the courage to face the conclusions of its own logic, and is written in an incisive and readable style to boot, however gross its defects may be in other ways, is so rare as to be practically unique. Mr. Owen's contention is that woman is practically useless and even harmful outside of the home, or, in the more emphatic language of the book, "if women were limited merely to the purposes of reproduction, the State and the nation could still continue." All statecraft, almost all of industry, the great bulk of art, literature and science is man's sphere, created and maintained by him alone: "He is the dynamic force, the creator, the originator, the imperative voice. She is—sometimes charming." The author opposes the entrance of women into business of almost any sort and denies that English women suffer any important legal injustices, altho to maintain this thesis in the face of the one-sided divorce law of his country he is forced into an endorsement of the "dual code of morality" (p. 159). But with all due allowance for the merits of the book, frankness and clarity, the conscientious reviewer is forced to point out certain defects in its treatment of the suffrage question. One of these is revealed in an amazing footnote wherein is explained the reason why no reference has been made to the actual working of the system condemned, the explanation being that no experience of foreign nations or distant colonies could apply to the "widely different" conditions of England. A book which devotes over 300 pages to speculating on what might be the consequences of extending the suffrage and complacently ignores all evidence as to what the consequences really are in women suffrage countries comprising over 12,000,000 population is irrelevant in a scientific age, however ingeniously written it may be. That selfsame footnote (p. 296) illustrates something worse when it speaks of woman suffrage as existing in "one or two of the least settled States of the United States of America." It illustrates the author's chronic inaccuracy of statement. Worst of all are the occasional outbreaks of pure nonsense which may occur in the midst of the sanest chapters. A typical example of this is the interjection into an otherwise ra-

tional critique of John Stuart Mill's position the remark that Mill's was "the only first-class mind that has supported woman suffrage." Only! Shades of Plato, Meredith and Lincoln!

Saint Gregory The Great. By Sir Henry H. Howorth, K. C. I. E., Hon. D. C. L., F. R. S., etc. With Illustrations, Map and Tables. New York: E. P. Dutton & Co. $3.50.

The story of the life of Pope Gregory the Great not only possesses large historical and ecclesiastical significance, but appeals strongly to the universal spirit of heroism and achievement. Gregory's noble extraction, his early entrance into public life, his ecclesiastical preferments and service as papal nuncio at Constantinople, fittingly prepared him for the great task of shouldering the burdens of the bishopric of Rome at a critical period of ecclesiastical development. But when one recalls the fact that Gregory filled his high office for only fourteen years, and that during most of this period his health, which had never been robust, was shattered by disease and harsh ascetic observances, the amount and variety of his labors and the effectiveness of his efforts are simply amazing. Besides the reforms in ecclesiastical discipline which he pushed with remarkable vigor, he showed an interest in every question which concerned the life of the Church, he managed with great astuteness the vast patrimonies of St. Peter's, took decisive action from time to time in the political troubles that harassed Italy, planned great missionary enterprises, made far-reaching changes in the calendar, musical forms and Church liturgies, and wrote, preached and taught so effectively that his example and writings have left their impress on the Church's thought and usage to this day. Not all his great influence, however, was exerted for the best. Side by side with his devotion to duty and high character as a bishop of his flock we find his foolish adulation of the base and cruel emperor Phocas and his weak subserviency to the vicious rulers in Gaul. His many marks of intellectual distinction and practical wisdom were curiously paralleled by the most fanciful theories of Scripture exposition, by childish credulity and crass superstition. He greatly strengthened, if he did not lay the foundation of, Rome's ecclesiastical supremacy and opened the way for her universal dominion, but his contempt for classical learning, art and all secular culture, and his religious narrowness and bigotry did much to block the wheels of progress and encourage obscurantism in its centuries of struggle against the forces of enlightenment. These various traits in Gregory's complex character and their reactions on the life of his time are carefully set forth in Sir Henry Howorth's new volume, which is rather a series of studies than a consecutive biography. The author has made a conscientious and extended examination of the sources and draws much of his material from the writings of Gregory, especially from his voluminous letters. His familiarity with the works of Dudden, Barmby and others has stood him in good stead, as his many quotations show, but he has followed an independent course in arriving at his conclusions and has set down his own estimates with both sympathy and decision. It is to be regretted that a book of such solid worth should be frequently marred by a halting style and crude if not ungrammatical expressions. The author promises another volume, to be issued soon, dealing with Gregory's mission to England, which is barely mentioned here, but this hardly warrants the caption which the publishers have printed on the cover of this book: "The Birth of the English Church."

Literary Notes

....Some good advice to young men on the cultivation of habits, manners and ethics that make character and bring success will be found in *Building the Young Man* (McClurg; 50 cents) by Kenneth H. Wayne.

....The choice language and gracious style of Rev. Oliver Huckel are the most attractive features of his book on *Spiritual Surgery* (Crowell; 75 cents), wherein he points out moral and spiritual truth thru the medium of analogy.

....Those interested in practical religious work among boys will do well to add to their literary helps the suggestive book by Prof. Allan Hoben, Ph. D., on *The Minister and the Boy* (Univ. of Chicago; $1), which is based on the author's own experience in boys' organizations.

....The inaugural address of President Porras, of Panama, October 1, 1912, is published in a pamphlet entitled *Progressive Panama*, by J. A. Ferguson, Ancon, Canal Zone, with many portraits and biographical sketches of prominent politicians of the republic and statistics of its resources.

....A new edition of the late Bishop Whipple's autobiography, *Lights and Shadows of a Long Episcopate* (Macmillan), has just been published. It is the story of a high-souled Christian apostle, working successfully for the establishment of religious institutional life in what was then a frontier section, and well deserves its continued popularity.

....What literary value there is in the *Daughter of Heaven*, by Judith Gautier and Pierre Loti, evaporated in the translating and adapting of it for the Century Theater in New York city. The spectacle is remarkable, however, for the unexcelled realism and richness of its stage effects, and for the beauty of its costuming and color. Yet the action is almost as much clogged by these splendors as by those preliminary scenes, not found in the French text as published, but added by M. Loti or by his graceless adapter, "George Egerton." The drama is not, in its original form, strong in action: as played, it is deplorable, and leaves the spectator cold except during perhaps ten minutes of the evening. The English translation of the *Fille du Ciel*, by Ruth Helen Davis, issued by Duffield & Co. ($1.25), is in many respects preferable to the clipt and stilted version used on the stage.

....The acting of Mr. Winthrop Ames's Little Theater company in New York is marked by more finish than we usually remark on the American stage, and the performance of Arthur Schnitzler's witty *Anatol*, a dramatic essay in cynicism, demands high praise. True, there is less variety in the interpretation of the principal figure than one might expect from a more talented actor than John Barrymore, but Mr. Barrymore, as the "toy philosopher," is convincing in his portrait of well-bred fatuity, refined sensualism and egotistical sentimentality, and the player's monotony of gesture and delivery is no serious blemish in view of the absence of anything like character-development in this social satire. Schnitzler may be condemned as a German decadent and his characters in this piece are triflers and light o' loves, but if such episodes as those of *Anatol* are deserving of representation on any stage they are best produced by a manager of Mr. Ames's taste and sense of fitness. The adaptation of the play is that made by Granville Barker, published by Mitchell Kennerley.

....*Modern Business Methods* has a scholastic ring. The corporation of today hires a man whose business it is to invent a system applicable to its needs. The volume by Mr. Henry E. Brown and Mr. William P. Teller is an attempt to synthesize these and give the student the basis that he may adapt himself to the methods of any firm. Its value is doubled by the extensive illustrations. (Chicago: Rand McNally; 75 cents.)

Pebbles

A COUNTRY dentist advertises that "he spares no pains" to render his operation satisfactory. —*Lippincott's.*

MISS INEZ MILHOLLAND tells of a Newport man who was invited to a house party at Bar Harbor, and telegraphed: "Regret I can't come. Lie follows by post."

"SAY, I want to show you something funny. Come over here where we can watch without being seen."

"What is it?"

"Wait till you see it. Let's stand here. Don't let them know we're watching, but I want you to look at that couple straight across from us. The girl has blue bows on her shoulders. Do you see them?"

"Yes. The boy has a rather high pompadour."

"Those are the ones. Just watch them for a moment. Don't let them know."

"I don't see anything wrong about them. They seem to me to be dancing very well."

"Oh, they're dancing all right; but they're foolish. Notice the way she's looking at him and the way he smirks at her. Do you know what I'd do if I were that girl's father?"

"What?"

"I'd go in there and yank her off that floor."

"Why?"

"She's a silly acting thing. See how she's making eyes at that young fool now. They both ought to be spanked."

"Oh, I don't think they mean any harm. They're both young and having a good time—that's all."

"You wouldn't think that if the girl were your daughter."

"Yes, I would."

"It's all right to stand here and say so, but you wouldn't, just the same."

"It happens that she is my daughter."

"What?"

"I say she is my daughter."

"My dear fellow, let me congratulate you."

"You've changed your mind rather quickly, haven't you?"

"Not at all."

"But you were insinuating a moment ago that my daughter was foolish. Now you're congratulating me on being the father of such a girl."

"Oh, I'm not congratulating you on being her father. I'm congratulating you on your self-restraint."—*Chicago Record-Herald.*

The Independent

Entered at New York Post Office as Second Class Matter
Publisher, Clarence W. Bowen
130 Fulton Street - - - - New York

A WEEKLY MAGAZINE FOUNDED IN 1848
One Year, $3.00 Single Copies, 10 Cents

Single copies over six months old, 25 cents. Postage to any foreign country in the Universal Postal Union, $1.75 a year extra; to Canada, $1.00 extra. Subscriptions will be received for other periodicals, and clubbing rates will be granted as low as those offered by any responsible agency.

An order for the change of an address should be received two weeks before the change is to take effect. The old as well as the new address should be given.

For the convenience of our subscribers we will send on receipt of the publisher's price any book reviewed or advertised in our columns.

Volumes of The Independent are completed at the end of December and June, and a full index is furnished free on application. Neat binders holding in book form thirteen current issues will be furnished for 45 cents.

If the numbers comprising any semi-annual volume are returned to us prepaid in good condition with $1.50 we will bind the volume in handsome and substantial half buckram and deliver it free anywhere in the United States.

We are always glad to receive articles for examination, but writers desiring the return of their manuscripts, if not accepted, should send a stamped and addressed envelope. Even so, we cannot hold ourselves responsible for their return. Authors should preserve copies of their manuscripts.

Advertising rates will be furnished on application.

The Attempted Assassination

WHAT the battle of San Juan Hill could not do for Theodore Roosevelt the surer bullet of a brooding weakling has done—it baptized him with blood; it has made him the Confessor—we trust not the Martyr—of his gospel. It has bracketed him with our martyr Presidents, scarce missing their full canonization. We rejoice that the assassin's pistol failed of its murderous purpose. Roosevelt has done great service to his country in the years of his administration; may he live to do more.

The exhibition he made of physical and spiritual self-control on the occasion was most masterly. There is not one man in ten thousand who could have done what he did. He would not hasten to a hospital; he would not consider his own life; he would speak, and he did speak. He stood before the vast audience, told them very seriously that he had been shot but five minutes before, that the bullet was in his body. He held up the pierced manuscript that had saved his life, and pointed out the spot where the ball had entered his breast. Then he told them that he cared not for himself; that he might die—that was of no importance; that all he cared for, that all any man fit to lead should care for, was the cause for which he fought. And then he continued for fifty minutes, reading from his mangled notes until his weakening voice and the loss of blood compelled him to stop; but not until he had exhibited such force of will, such superb nerve, as will be a pattern and inspiration for thousands who in the generations to come will hear and tell the tale. That was a man who was man all thru; and more persuasive than any vote-getting speech will be this sanguinary incident in the long life, we trust, of Theodore Roosevelt.

This is the time to acknowledge what has been forceful and admirable in Roosevelt's carrer. It is the time to put a period to that flood of vituperation which has disgraced this campaign. But it is not the time to slacken the contest of argument or to abate enlightening the voting people on the new and old issues involved. Mr. Roosevelt and Mr. Bryan are right in saying that the appeal must still be prest up to the day of decision; but it must be made without personal rancor. It was right—it was only decent—that President Taft and Governor Wilson should express to Mr Roosevelt their sympathy with him and their horror at the crime, but they and their friends must still consider the people, the nation, rather than their contesting rival. It is simply time to cease abuse and hold to argument. Mr. Roosevelt has not been innocent in this war of epithets, and has been free in the use of short and ugly words; and some of the speakers against him, tho not candidates themselves, have tried to make us believe that Mr. Roosevelt in his personal ambition was ready to overthrow the pillars of the republic and proclaim himself tyrant of the nation. That charge of treason is absurd and false, but there were those who believed what irresponsible journals and speakers declared.

Such a one was Schrank, the half-witted, semi-responsible dreamer and addled fanatic, who had the conceit to believe himself chosen by Providence to save the republic from falling into the hands of a despot. He believed what he had been told in the reckless journals he read, and acted on it conscientiously according to his lights. What a pity it is

that we cannot corral and confine all the cranks as possible bullet-saviors of the nation! What a greater pity it is that we cannot gag the mouths and blot the sheets that riot and reek with slander! They are crimson with the blood of four Presidents of the United States; they are guilty of the death of three. The chief guilt of such crimes does not rest on the men who drew the trigger, but on the men who inflamed the passion that pulled it.

Of the eight men elected President of the United States before the present incumbent, three have been assassinated and a fourth has by a miracle escaped the like fate, but now carrying in his body the bullet which he escaped in war. War has her victories, but for Presidents peace has far greater perils. Lincoln, Garfield, McKinley, died on the battlefields of peace, and only the accidental breastplate of his written speech saved Roosevelt's life. It is a horrible penalty that we pay for distinguished service to the country. We have to surround our Presidents with guards to save them from skulking, vengeful murder. We are a murderous nation; we kill our best. Murder is a habit. We make it easy. Any witless fool can buy a pistol; any gangster can draw his gun in a saloon fight; volleys of shots can fly in a street riot. The carrying of concealed weapons is forbidden in some States by laws that cannot be enforced; and in other States the man without a pistol in his hip-pocket is very nearly as faulty in attire as if he had forgotten his watch. The chief use of a pistol is to kill people. Its sale should be forbidden; its possession in a house should be regulated and registered by law.

Lincoln, Garfield, McKinley, Roosevelt —it is a mighty succession of victims, such as Russia or France or Italy cannot equal. Booth, Guiteau, Czolgosz, Schrank —it is a motley register of the refuse of the nations.

"Down with Roosevelt; we want no king!" was what Schrank wrote in his vindication. "Amen" say we to the second clause; the reason why we do not say "Amen" to the first is because we have no fear that Roosevelt will become king. We do not believe that he wants to be a king or that the American people want a king. It is particularly absurd to charge the Progressive party with making the President into a king when that party has gone to the opposite extreme of suggesting that the President be subject to recall by popular vote. If, however, we thought that Schrank had been induced to think that the election of Roosevelt for a third term meant the overthrow of popular government, that this one man thru selfish ambition and revenge was bringing ruin to the country and that his removal would avert the danger, then we could well see how a flighty patriotism could come to regard it as duty to sacrifice one's own life to free his country from the impending danger. "Resistance to tyrants is obedience to God."

To be sure we read history in the opposite way from Schrank. We fail to find in history that assassination, whatever excuse there may have been for it, has ever accomplished its purpose. Marat was a villainous man without any legal right to the power he used so ruthlessly. Alexander II ruled Russia as an autocrat. But the murder of the first did not stop the Terror and the murder of the second postponed parliamentarianism in Russia for a generation. Still the world accords to Charlotte Corday and the Nihilists a certain measure of admiration for their well meant but misguided acts.

No, we cannot throw the blame for the dastardly deed altogether upon the man who held the revolver. Schrank's crime had its origin in credulity and for this he was less to blame than those who have deliberately played upon that credulity with all the arts known to writer and artist. The worst feature of it is that there are many thousands equally credulous even tho not so easily moved to violence. Roosevelt, like Lincoln, Garfield and McKinley, was struck down by the miasma of malice that had enveloped him. We do not mean that it worked thru telepathy, auras or any supernatural agency. Fortunately in this case the agency is clear. The assassin has himself incriminated the men higher up and specified thru what channels the evil influence reached him. There are only two ways by which such catastrophes can be avoided in the future; one is to make all

of the people immune to virulent suggestions from the press; the other is for the press to refrain from virulent personal attack. The first remedy is impracticable, altho the majority of the American people have acquired an astonishing degree of immunity to printer's ink there is no antitoxin with which the rest could be inoculated. The second is the only way. It is perfectly possible to enter with earnestness into political questions, to point out the dangers of certain policies, to call attention to defects in characters of candidates without using language that would afford any pretext of justification for such a crime as this of Schrank's.

The Reaction

After full consideration, the politicians, in their wisdom, have decided that not more than 100,000 voters, or less than 1 per cent. of the 15,000,000 citizens that are expected to go to the polls on election day, will be influenced by the attack upon Mr Roosevelt's life. This is the "second thought" estimate of an influence which, on the day after the attempted assassination, was expected by the more excitable contingent to elect the Progressive candidate.

Whether wild or conservative, the expectation and the estimate are, equally, frank recognitions of an interesting phase of popular psychology. It is questionable, however, whether the usual interpretations of it are true.

The reaction in favor of a public man who has been roundly abused and then gets hurt or killed is, of course, emotional, and we are all of us emotional, even the "hard-headed" persons that President Hadley once rashly discriminated from the "soft-hearted." Men who remember the assassination of President Lincoln have had unfortunately numerous opportunities to observe the effect upon the common mind of murderous assaults upon public men. Including the attacks upon Mr. Gaynor and Mr. Roosevelt, there have been five of these highly sensational events. Our older readers, who remember them all, will confirm our judgment, we think, that in each instance the emotional recoil has been followed by a sober re-examination of judgment, no less than by a change of heart. Lincoln and McKinley probably stand higher in popular estimation than they would have done if they had died natural deaths. Garfield, subjected to the same searching revision of estimate, probably neither gained nor lost greatly by the ordeal. We think it probable that this will be true also of Mr. Gaynor and Mr. Roosevelt.

The emotional reaction to a murderous attack upon a public man not only awakens sympathy for him, but also it presently makes every thoughtful man ask himself whether his opinion of the victim has, after all, been just. A certain element of bitterness, perhaps, at least of prejudice, drops out of his consciousness and he looks at the facts dispassionately. This calmer attitude of mind is distinctly favorable to truth finding. It therefore happens that the public man who has in fact been misrepresented emerges from the re-examination of his character with credit. The man who has merely been reviled, but has not been to any great extent misrepresented, does not in the long run gain much, and he may not lose much, by the reconsideration of his character and behavior.

Lincoln and McKinley were not only maligned, they were also misrepresented. Thousands of men disposed to be just misunderstood them. Their tragic taking-off brought to light the facts and a more nearly truthful account of their characters. Garfield was maligned, but never seriously misrepresented. Gaynor was maligned, but his habit of declaring himself over his own signature on all possible occasions has prevented any serious misapprehension of his character or of his attitude toward public questions.

In a yet greater degree all this is true of Mr. Roosevelt. We doubt if any considerable number of his fellow citizens have ever seriously misunderstood him. His life and his mind have been an open book. In public and in private he has talked and he has acted perhaps with less reserve than any other prominent man in modern times. His devoted followers and his political opponents alike have known the man about as he has actually been. Those who admire him and work with him, do so because he represents and stands for things for which his op-

ponents detest or fear him. There is no misunderstanding on either side. The issue is clean cut. Partisans and enemies perfectly understand what he is and what he fights for, and they are aligned for or against him because they are themselves aligned for or against these things.

It is a good thing for the community that mankind is thus competent and disposed, now and then, to take its judgments in hand, examine them calmly and, if reason is found for so doing, subject them to revision. Happily, no such shock as that which is given by murderous assault is necessary to provoke re-examination and revision. No public character in American life has been more universally respected or more sincerely honored since his death than Grover Cleveland. The animosities, the gross personal attacks that disgraced the political campaigns in which he was a central figure died out and are almost forgotten. The mere passing of years has disclosed the true character of political events and the reasons for policies which Mr. Cleveland stood for, and has revealed the sterling sincerity, truthfulness and courage of the man.

There is no surer basis upon which to rest our belief in the mental and moral soundness of the American people than this habit which they invariably display of taking their own judgments in hand. The popular sympathy for Mr. Roosevelt and the frank readiness of the public to acknowledge that it has sometimes dealt with him severely will not elect him to the Presidential office; but they will secure for him an enduring regard and a final estimate of his career which will be at once true to the facts and essentially just.

For Whom Shall We Vote?

THE day of political decision is near at hand. Not a few who are yet undecided will of necessity within a few days make up their minds for whom to vote. The hard-and-fast Democrats must vote for Wilson, for Jackson is dead. The stand-pat Republicans will as certainly vote for Taft. The cowboy regiment and the army of his admirers could not be swerved from Roosevelt. The followers of the two warring Socialist factions and the Prohibitionists are immovably fixt to their single idea. But there are wide fringes of the three chief parties in which a multitude of voters are yet looking for the conclusive reason why they should choose one rather than another of the leading candidates. To such, and to all, we offer the pleas this week of the candidates themselves. Let the reader judge for himself.

In our view the conclusion is clear. We do not say he will be elected, but for the welfare of the republic at home, and for honor and peace abroad, we advocate the re-election of President Taft.

We do not favor the election of the candidate of the Democratic party. Governor Wilson is the best candidate it could present, a scholar of American history and he has made a good Governor. But he represents his party and its principles. We have previously pointed out a consideration that has serious weight with us, and on which we will not now dwell, that his is the party of racial oligarchy, which asserts, wherever it is in full control, white man's government, and the suppression of the votes of a tenth of our people because of color. That ought to be enough to damn a party, if it is not. We in the North are shortsighted and cannot look far enough to see a wrong that does not exist with us. But let that pass. Nearer at hand for those who are balancing their duty is the threat of business disturbance which the success of the Democratic party presents.

We believe in doing right tho the heavens fall; but the doctrine of the Democratic platform is not right, and the attempt even partially to enact it into law would be hazardous. It declares all protective duties wholly wrong and also unconstitutional. Then the party, if in power, ought to reduce all tariff to a revenue standard. To be sure, it will not do it and does not intend to do it; but the reductions proposed will be in the line of the principle proclaimed, and will frighten manufacturers. They will not extend operations by enlarging factories and making large contracts when they do not know what to expect. There will be a reduction of wages and strikes will follow, as when the Wilson tariff be-

came law. Of course there should be and will be tariff revision and reduction, but the promises of the Democratic party will seem to augur reckless reduction. We do not say that there will be reckless reduction, but it is threatened, and that will frighten business, whch has a very sensitive nerve.

Further, this danger would be accentuated by the fear of radical action as to trusts and monopoly. The Democratic proposals are radical enough to alarm capital. They do not seek regulation, but legal suppression. The platform demands criminal prosecution of trust officials, the absolute suppression of monopolies, of all holding companies and interlocking directors, a stronger Sherman anti-trust law, and sharp restraint, still by law and not by a regulating commission, of railroad and express, telegraph and telephone companies. If such a program were to be carried out, in full and speedily, as threatened and promised, without gradual and careful amendment, the result could hardly fail to be disastrous.

The Democratic party is pledged to two other policies that are utterly wrong. One is the denial of the right of the people to re-elect a President who has served the people well, and that without lengthening the term to six years. But much more important is its attitude on the Philippines. It condemns the acquisition of the islands, and demands that we should hasten to get rid of them. That is enough to condemn the party that has no pride in the admirable work for civilization we are doing there.

Nor do we favor the election of Mr. Roosevelt for a third term of the Presidency. Two terms are enough. But letting that pass, the Progressive party's attitude to the Constitution is a dangerous one. It promises that an "easy" and "expeditious" way will be found to amend the Constitution, which would be tantamount to having none at all, for a Constitution which could be amended expeditiously whenever a law seemed forbidden by it, is already sunk in wreckage. It is proposed by widening referendum to enact a State law which may be plainly unconstitutional. And not only are constitutions made of no account, but equally the judiciary is weakened by the recall of judges and the reversal by popular vote of their decisions, as approved by Mr. Roosevelt. Like the Democratic party, the Progressive party is seeking power in the Southern States on the doctrine that popular government means white government and white only. Mr. Roosevelt would not admit Southern negroes to his Chicago Convention because the people did not want them, meaning white people, as if negroes were not people.

On the foreign policy of the nation we fear Mr. Roosevelt. He opposed reciprocity and the arbitration treaties. He has great self-confidence; he loves the activity of war; he is ambitious to do great and spectacular things. We should fear him in case the Mexican situation should again become acute. His ambition might easily plunge us into war. There are a plenty of chances for war, and such a catastrophe would be worse than any probable domestic peril.

We now turn to the Republican party, and we heartily desire the re-election of President Taft. We support him because he represents the party of equal rights for all, the party which opened and has never shut the door of equal opportunity. We support him because he represents the party which is most likely to give us a period of continued and growing prosperity. His party is pledged to reduce excessive tariffs, and will do it under information impartially obtained, and based on the comparative cost of production here and abroad. It will control the trusts by a commission which will restrain them as railroad commissions operate in the States. This is the method already proved effective, and yet sufficiently conservative to avoid business disaster. Unlike the Democratic plan it is flexible, and corporations can learn what they can do.

We specially desire the re-election of President Taft because we trust him in international affairs. He has proved himself a prudent Executive. We have had great danger of war with Mexico, but Mr. Taft resisted demands for invasion, and held our troops on the Texas side of the border. He has maintained peace with Japan and all the world. We have not that confidence in Roosevelt. Mr. Taft's good record is not at all confined to his admirable foreign policy; it covers

his domestic administration. Within the last week he has put the great army of minor postmasters under the civil service, putting them out of politics, an immense step in the right direction, and he has urged Congress to allow him to do the same by the offices which require Senatorial confirmation. The Senate is not up to this progressive mark. On another page he recounts the achievements of the past four years, and it is well in advance of anything that can be said of other administrations for the last thirty years. Particularly we call attention to the fearlessness with which the Sherman law has been enforced, as compared with the slackness of its enforcement during the four years following the contributions of millions of dollars by the trusts to secure the election in 1904 of his predecessor. He has made mistakes, but they have been personal and minor ones, while his successes have been many and notable, and his failures, as in the arbitration treaties and Canadian reciprocity, have been to his credit and to the discredit of those who defeated his progressive policy. For such reasons we support the candidacy of President Taft.

Offices Taken Out of Politics

By an executive order issued last week President Taft "took out of politics" 35,000 post offices. Only a few lines of print were given by the daily press, as a rule, to this order, which goes far toward completing the work of reform in the civil service of the United States. It was the act of a progressive statesman.

Those who have read Mr. Taft's messages know that he would go further in this direction if he could do so without new legislation. He would place in the classified service and under the merit rules not only these 35,000 fourth-class postmasters, but all the other postmasters, all the collectors of customs and collectors of internal revenue and all the marshals. He would take out of politics the customs collectors of the ports of New York, Boston, New Orleans and San Francisco, the postmasters of New York and Chicago, the internal revenue collectors North and South. These are the officers whose influence may be and sometimes has been used effectively in politics. We think that two years ago he first asked Congress to put them under the civil service rules. In December last he asked again.

Has any one of his predecessors in the White House urged Congress, in the public interest, to take from him the power to appoint these officers? Let us see what this year's platforms say. The Republicans "favor the passage of legislation empowering the President to extend the competitive service so far as practicable." This is in accord with Mr. Taft's desire and aim, but the recommendations in his messages should have been distinctly approved. The Democrats would have "the law pertaining to the civil service honestly and rigidly enforced." They say nothing about new legislation, without which the extension desired by Mr. Taft cannot be made. The Progressives demand "legislation which will bring under the competitive system postmasters, collectors, marshals and all other non-political officers," but they give no credit to Mr. Taft for his repeated efforts to procure such legislation. In his message of last December the President said:

> "I wish to renew my recommendation that all the local officers thruout the country, including collectors of internal revenue, collectors of customs, postmasters of all four classes, immigration commissioners, and marshals, should be by law covered into the classified service, that the necessity for confirmation by the Senate be removed, and that the President and others, whose time is now taken up in distributing this patronage under the custom that has prevailed since the beginning of the Government, in accordance with the recommendation of the Senators and Congressmen of the majority party, be relieved of this burden.
>
> "I am confident that such a change would greatly reduce the cost of administering the Government, and that it would add greatly to its efficiency. It would take away the power to use the patronage of the Government for political purposes. When officers are recommended by Senators and Congressmen from political motives and for political services rendered, it is impossible to expect that while in office the appointees will not regard their tenure as more or less dependent upon continued political service for their patrons; and no regulations, however stiff or rigid, will prevent this, because such regulations, in view of the method and motive for selection, are plainly inconsistent and deemed hardly worthy of respect."

But Congress failed to honor his rec-

ommendation. Neither the Republican Senate nor the Democratic House would pass the Burton bill or any other bill designed to embody it in law. He has done what he could. By one order he has added 35,000 postmasters to the merit list. In this important field for reform he is far in advance of many who call themselves Progressives. The credit he deserves should not be withheld from him.

The New War

THERE was no time to close the gates of the Temple of Janus. A new war was on before the old war was off. On the day that the three Italians and the three Turks sat in conference together in the reading room of the Hotel Beau Rivage at Ouchy, while just outside the window the band played waltzes for the guests taking tea on the terrace, another kind of music was being heard in the Balkans, for on that day King Ferdinand watched from a hight on the frontier the capture of Mustafa Pasha by his troops, the first step in their march toward Adrianople. From this point to Adrianople is only seventeen miles, say half an hour's ride by rail. How long will it take the Bulgarians to get there?

The man who last tried to go from the Balkans to Adrianople in this rude way was Czar Alexander II, and it took him six months. On July 16, 1877, he crossed the Balkans; on January 15, 1878, he entered Adrianople. And the Russians then outnumbered the Turks three to one. The Bulgarians can barely muster as many soldiers as are now gathered to the defense of Adrianople, and if they are not quick about it they may find double their number confronting them. But the Bulgarians have the advantage over the Russians of 1878 in that they start with Shipka, Plevna and Philippopolis, which cost the Russians such sacrifice, already in their hands. And we may question whether the Ottoman Government of today has an Osman Pasha to conduct its defense. There are not many such.

This is an old and familiar battleground. Military strategists must know it as well blindfolded as the chess player knows his sixty-four squares. It has been fought over many times and by many peoples in the eighteen hundred years since the Emperor Hadrian built here his strong city and gave it his name. But the Turkish commanders do not have to depend upon the misleading precedents of history for their knowledge of how to best defend the key to Constantinople. They have enacted dress rehearsals of the war upon this stage year after year; the problem that they have set for the annual maneuvers—the very problem that now confronts them, the advance of a Bulgarian army on Adrianople. In the maneuvers of 1909 the Red army, the imaginary enemy, was supposed to cross the Bulgarian border at Mustafa Pasha, as now the Bulgarians have done, for the purpose of cutting the railroad connection at Demotica, as doubtless the Bulgarians intend to do. But then the invading army was headed off, at least to the satisfaction of the Turkish commanders. In the following year 70,000 Turkish troops were concentrated about Adrianople to oppose another fictitious invasion by an army from Bulgaria. It is only since the constitution was granted that such maneuvers on a large scale have been attempted, but whether the discipline of the army is as good as it was in the Greek war of 1898, when it had been drilled by German officers, remains to be seen. Formerly the Ottoman army consisted exclusively of Mohammedans, but under the new regime of equality and religious toleration Christians are also admitted to military service. It has been questioned, however, whether this change has strengthened the army by adding to its numbers or weakened it by destroying the unity and fanatical zeal to which it owed its former victories, a question now likely to be decided.

The Bulgarians have shown marvelous celerity and enthusiasm. From a population of 4,000,000 an army of some 250,000 has been put into the field within two weeks. It took us two months to get 15,000 ready, or apparently ready, to start for Cuba in 1898. The Bulgarian Government did not have to notify the reservists individually. A notice tacked up in a village brought out not only those

under orders, but old men and boys and others exempt. If the troop trains were not ready for them they walked or drove in their carts to headquarters. The single track railroad conveyed them to the frontier without confusion or accident.

Three rivers running from the Balkan Mountains meet at Adrianople, the Maritza, the Arda and the Tundza. Down each of these a Bulgarian army is now on the march, converging at their junction, Adrianople. If they should capture the city it would be an easy matter to reach Demotica, a few miles to the south, and then Macedonia would be cut off from Constantinople and surrounded by enemies—or if you choose, friends—on four sides, Bulgaria to the east, Servia to the north, Montenegro to the west and Greece to the south.

A British View of Panama

Dr. Dillon, whom nobody ever accused of being an optimist on international politics, introduces his discussion of the Panama question with the following paragraph. It is a little startling to have *perfide Albion* held up as a model in the matter of keeping diplomatic promises, but in this case we fear that the United States has given some grounds for criticism, particularly if our Government refuses to submit to The Hague the question of the interpretation of the Hay-Pauncefote treaty.

"'One day,' says a Turkish fable, 'two optimistic little fishes were caught and laid on a gridiron to broil for the angler's midday meal, whereupon one of them told the other that he would not believe it.' This Oriental parable is brought back to my mind by the childlike faith which the British people place in parchment treaties and diplomatic treaty-breakers. It is invincible. They make no practical difference between the plighted troth and the self-denying deed even of those Governments whose interest it is to break faith and circumvent them. They are ready to ground their policy—nay, to stake their national existence—on the dead letter of a faded State paper; and their belief is proof against the overwhelming evidence of the senses. And now that our trusty American cousins have treated us to a piece of clumsy sharp practice, the British nation, like the little Turkish fish, says it cannot believe it. In French politics 'Panama' has long had an evil sound and a sinister meaning. Yankee sharp practice is now investing it with a still worse import in world politics. Panama will soon be taken to connote the utter futility of international stipulations."

A Turkish Protest

The protest of Kiamil Pasha, Turkish Premier and aged statesman, against the appeal by King Ferdinand of Bulgaria to religious passion against the Moslem Turks, pitting the Cross against the Crescent, is humane and we might say Christian in the truest sense. We have a way of calling whatever is good Christian, sometimes forgetting that what is good may be human for all faiths, and that what is not Christian is not necessarily all bad. We are sorry to see something of this same incitement of religious passion in Professor Pupin's otherwise excellent address to the Servians and Montenegrins in a meeting in this city last Sunday. For the fund for the Red Cross in the Balkans, and "for other purposes," he subscribed $10,000, which was very proper, but he said, "It is the Christian against the Moslem. . . . To arms, then, fellow Serbs; to arms, ye followers of Christ." That language is unchristian. It is after the pattern of a Moslem holy war. It is of the spirit of the Crusades. Kiamil Pasha well says: "The war is likely to be bitter enough without letting loose religious passions. The Ottoman Government condemns it in the strongest possible manner."

The Youthfulness of Students

Whenever the alumni return to the alma mater the common remark is, "How much younger the students are than they used to be." In vain the registrar brings forward his statistics and proves that the average age of entrance to college has been steadily advancing for a generation; they persist in their conviction. Now, Professor Keeble in his presidential address before the botanical section of the British Association for the Advancement of Science, comes to the support of the common conception by laying down "the biological law that as society grows older its young men grow younger. Undergraduates call themselves men, not solely from a sense of pride, but also in obedience to tradition. Centuries ago they went up to the university as men of fifteen or sixteen; now they go up as youths of eighteen or nineteen. With respect to moral discipline we are not unforgetful of their

youth; but with respect to intellectual education we treat them as tho they were grown up." This reminds us of the sarcastic remark of a distinguished American scientist, that the college of liberal arts was a device for the artificial prolongation of boyhood.

Philæ and the Dresden Madonna

George Birdwood is one of the most accomplished of the students of the antiquities of India. He is greatly offended that the ruins of Philæ should be covered and destroyed by the Nile Dam, which is just now completed. It is of no comparative consequence to him that the dam will provide irrigation that will supply food and comfort to hundreds of thousands of human beings. Man does not live by bread alone, he says. The Parthenon, Philæ and the Taj Mahal are, he declares, taken with their surroundings, "the three most enchanting 'beauty spots' on the face of the world," yet he would not put the Parthenon before Philæ, with its temple of Isis, the palm-tufted Jeziret-el-Birbe, "and its grouped columns of the Greek and Roman periods set like an emerald in the golden silence" of the most spiritual stretch of scenery along the historic valley of the Nile; and certainly he would not prefer the Taj Mahal. "But," says he, "to an engineer nothing is sacred." Sir Henry Knollys, soldier and administrator, thought to pose Mr. Birdwood and asked, "Were one in a garret, with a Dresden Madonna on the walls and a live baby on the floor, and suddenly it was all ablaze —which would one save? He answers the question thus startlingly in the London *Times:*

"Well, I would try to save both, but if the direful choice were forced on me I should certainly save the Dresden Madonna first. One can get another baby any day, by adoption, if not by grace; but there is only one Dresden Madonna to be had for love or money."

One can imagine the horror which other correspondents express. It reminds one of the dilemma set before a certain Greek philosopher: If you had the chance to save only one of your drowning wife and child and sister, which would it be? His answer was, almost in George Birdwood's words, "The sister; for I could get another wife and another child, but not another sister, for my mother is dead."

We heartily commend the effort of Fisk University, Nashville, Tenn., to raise $300,000 for the beginning of an endowment. We have had close knowledge of that institution since its founding at the close of the Civil War for the education of the freedmen. It was named after Gen. Clinton B. Fisk, who was as devoted to all good service after the war as he was admirable as a soldier. Fisk University stands second in rank of scholarship of all institutions for colored youth, Howard University, at Washington, being allowed the first rank. The General Education Board has offered Fisk $60,000 on condition that private gifts raise the amount to $300,000, and we learn from Mr. Harvey L. Simmons, treasurer, of this city, that $126,000 remains yet unpledged. The graduates and faculty are giving and doing what they can, but the gifts of churches and men of means are desired, and can find hardly a worthier object. We much regret that President Gates's accident and subsequent illness has compelled his resignation. On another page a fuller statement is made, but we may here give our full endorsement to an effort which should not be allowed to fail.

One of the conditions that imprest Ambassador James Bryce in his visit to South America was the absence of color prejudice. Everywhere everybody is called white who is not a full-blooded Indian. There is no color problem, as in the United States, where every one who is not pure white is classed as colored. And he finds that the white crossed with Indian blood does not degenerate, as some of the most forceful are mestizos:

"The Mestizo in Peru is not palpably inferior in intellect to the Spanish Colonial of unmixt blood, but seems to be substantially his equal."

We observe a similar fact in this country.

That pugilist Johnson is a disgrace to his race as well as to humanity. We do not mean because of his profession, altho that is discreditable enough, but because

of his personal behavior, a rowdy as well as a prizefighter. Nor do we have in mind his marriage to a white woman, for that is not necessarily culpable, altho she had to divorce him. His last escapade with a silly white girl, to whom he is not married, gives occasion to the Chicago outbreak against him, and, with the story of his whole career, justifies Dr. Washington in stigmatizing him as a disgrace to his people.

The day following the death of the ex-Carmelite friar and famous preacher, Pere Hyacinth, *La Croix,* the pugnacious and clerical daily of the Assumptionists, stated that his son, Paul Hyacinth Loyson, had kept his father from returning to the Church. The young man wrote an indignant denial, which *La Croix* refused to publish. He next brought the affair into court On October 9, the court condemned *La Croix* to pay a fine of 100 francs, damages of 1 franc, and ordered it to print the letter which it had refused.

The patriotic passion of the allies in the present war against Turkey appears in the fact that 8,000 Greeks have already volunteered from this country and sailed for the seat of war, and it is believed that not less than 30,000 will go. There are fewer Serbs and Bulgarians here, but they are enlisting and pouring out their money for their country. One Serb farmer from Montana came to New York bringing $5,000 out of his $7,000 savings for his native country's cause. These farmers and peanut venders have heroism in their souls.

The way the Democratic campaign committee is acknowledging its receipts as fast as the money comes in is admirable. We are told who has given $15,000, who $10,000, and so down the list; and in the State journals the giver of a single dollar has his name printed. We are not sure, but if this way prevails we shall find at last as much rivalry to subscribe as there has been unwillingness.

Now that the price of beef has gone so high that families will not buy it, and the butchers are shutting up their shops, it is time to agitate for free beef. The food of the people should not be taxed. England gets her beef from Argentina at little more than half what we have to pay. There is a 27½ per cent. tariff on live cattle and 22½ per cent. on drest beef.

Three miles an hour is the best rate for walking. Elaborate experiments made in Germany on the rate of production of carbon dioxide proved that to be the most economical speed for the average man with no load or a light one. To go 50 per cent. faster requires nearly 100 per cent. more energy.

The Rev. Charles Stelzle in a late essay stated that "the death rate among negroes is increasing, whereas it is decreasing among whites." Professor DuBois quotes the census figures to show that it has decreased with the negroes as well as with the whites.

A woman who has taken the platform as a spellbinder says that she likes one who is 100 per cent. a man. But the wisest of the Roman authors gave his preference to the man who had a touch of the child in him, and the child who had something of the man.

It is a comfort to learn from *The Athenæum* that, as proved by the diction of the Hon. James Bryce's new volume on South America, "long residence in the United States has not spoiled his scholarly English." So in spite of all temptations he remains an Englishman.

Straw votes are too partial to be worth much, but we expect that the straw vote to be taken thruout the country on November 5 will indicate pretty clearly, tho of course it will not determine who is going to be elected president on January 13.

Probably it would be unfair to accuse Governor Wilson of trying to catch the 1,500,000 women voters when he sat on the edge of his Pullman berth and sewed a button on his coat with white thread.

Already we have Greece, Servia and Bulgaria, on account of their reluctance to join Montenegro in the fight against Turkey, alluded to as "the Balkin' States."

Insurance

A New Voice in New Hampshire

For more than twenty-seven years the State of New Hampshire, thru its laws and the advocacy of successive insurance commissioners, has been committed to the principles of that queer populistic doctrine engrafted years ago on Western and Southern insurance codes and known as the valued policy law. To students of sectional populations who understand the essential differences between them, the principle is known to be alien to the ideas and customs of the inhabitants of New England, and as a consequence the enactment of such a law in New Hampshire was an amazing thing at the time and has remained an anomaly since.

Altho the valued policy law is an invitation to the holders of policies in fire insurance companies to secure insurance in excess of the value of their property, guaranteeing them if it is totally destroyed by fire that the insurers will be compelled by the courts to pay the face of the policies regardless of the values involved, the results seem to indicate that the people of New Hampshire have remained beyond temptation. Apparently, the fire insurance loss ratio in that State has not been materially augmented by the existence of the law. Fire insurance companies do not seem to have complained of difficulties encountered in adjusting losses on an honest basis, and it is but fair to conclude that the buyers of fire insurance protection in that State are grossly misrepresented before the world by the valued policy statute.

In the sixty-first annual report of the Insurance Department of New Hampshire, recently issued, the Insurance Commissioner, Hon. Robert J. Merrill, makes three recommendations of interest—one of them being the repeal of the valued policy law, a law which, as he says, provides "that, in case of total loss resulting to a building, the amount paid by the insurance companies shall, in the absence of fraud, be the amount stated in the policy regardless of the true value of the property." He expresses the opinion that New Hampshire should rely for prominence upon grounds other than a law founded on suspicion and an apparent confession of inability to mete out justice to insurers and insured. "That the results of the valued policy law," he says, "have been neither as bad nor as good as its enemies or its friends claimed is only evidence that the great majority, both of insurance companies and insured, are honest and deal fairly with each other."

That is an accurate statement of the situation. The results under the law in New Hampshire have been nothing as compared with that which was possible among a less virtuous population. The immunity of the companies from being plundered rests solely on the general honesty of their policyholders in the State. Under the circumstances, it is difficult to account for the existence of such a law there except upon the theory that it represents the opinions and feelings of a mass of people—they may constitute a majority of the electorate—who own little or nothing, insurable or uninsurable, and who possess a constitutional dislike for corporations of any and every kind. Again, it is recalled that the law was enacted in 1885, a period of depression and social unrest in the United States, when populistic remedies were regnant, and perhaps the State became a temporary victim to economic delusions from which it has long since recovered

In common with most of the people of the country now, those in New Hampshire are become apostles of conservation and some of their insurance laws are anachronistic and destructive. Insurance Commissioner Merrill says that every year the department's attention is called to "suspicious fires in which there is little question but that the existence of this law plays greater or less part." He characterizes it, and justly so, as "contrary to the fundamental principles of insurance, namely, indemnity for loss, is vicious in conception, an incentive to crime, and ought to be repealed."

This is a new voice in New Hampshire, weighted with truth and sense, the words of a thinker and leader working for the best interests of his constituents, and it is hoped he will be hearkened to.

Financial

Diversity in Investment

THE head of a manufacturing company which is known from one end of the country to the other recently invested the sum of $101,000 thru a firm with which the writer happened at one time to be connected. At the very outset this man, who is known as one of the shrewdest in his own line, announced to his brokers that he believed in getting as great an element of diversity into an investment as possible, and that he wanted this moeny to go into a lot of different bonds. When his selection was finally made there were exactly fifty different bonds in the list, all railroad mortgage issues of the highest grade.

This investor thought he was getting diversity, but he wasn't—except in a most limited sense. The bonds he bought all have different names, it is true, and some of them are perhaps a little better than others, but all of them are about alike. They are all absolutely safe mortgage bonds, all yield about the same amount. All of them are railroad issues, and the same influence which will cause the price of any one of them to rise or fall will exert an absolutely similar influence on the price of all the others.

Splitting up an investment into a great number of different issues furnishes a certain amount of diversity, it is true, but not of the kind that the scientific investment of money demands. And that is true whether the amount involved is $5,000 or $100,000. It isn't enough, by any means, to fix on some kind of stock or bond and then pick out a number of different issues of that kind. An element of real diversity can't be obtained that way. The investor previously referred to thought it could, but he was wrong. All he really was doing was multiplying his chances of having something go wrong.

Real diversity in investment — the avoidance of putting all the eggs in one basket—can only be had by an intelligent appreciation on the part of the investor of his own individual needs, and the purchase of *different kinds* of securities conforming to these needs. If an investment is *very* small, it will hardly do to try to split it up among several classes of stocks or bonds, but where the amount involved is as much as three or four thousand dollars, the element of diversity should be carefully considered. It is easier, perhaps, to pick out some good bond or some good stock that seems to be suitable, and say, "I'll take three of those" or "I'll take fifty shares of that," but it isn't the way to do—the way to get the best results. During the life of the investment a time is almost sure to come when the investor will wish that he had taken more care.

Suppose that the amount to be invested is $15,000 and the income desired is 5 per cent. Lots of good public service corporation and industrial bonds and not a few railroad issues can be had to yield exactly that, but the investor who picked out one class of bond and bought ten of that kind would not be making the most of his opportunities. A far more reasonable thing for him to do would be to divide his investment into three parts and buy five of each kind of bond, subdividing the parts by buying two bonds of one company, perhaps, and three of another. His railroad bonds might yield him 4½ per cent., his public service bonds 5 per cent., and his industrial bonds 5½ per cent. The average would be the 5 per cent. he was looking for, but he would be in a far better position than the man who wanted 5 per cent. and set out to get it by buying bonds all of one class. His investment would have not only the cardinal virtue of diversity, but, in the case of changing conditions, would be flexible as well.

....In the first half of the current fiscal year Canada received 273,649 immigrants, and 89,659 of these were from the United States.

....The index number of *Bradstreet's* for October 1 was 9.4515, the highest point reached since this average of the prices of a large variety of staple commodities was first published.

The Independent

VOL. LXXIII NEW YORK, THURSDAY, OCTOBER 31, 1912 No. 3335

Survey of the World

Political Funds

Under the new law requiring the publication of campaign contributions and expenditures, long statements were filed last week with the Clerk of the House of Representatives by the treasurers of three political parties. The National Progressive party reported that $304,116 had been received and $292,756 expended. Unpaid obligations amount to $41,341. The largest contributors were Frank A. Munsey, $70,000; George W. Perkins, $45,000; W. Emlen Roosevelt, $30,000; Douglas Robinson, $15,000; Mrs. Willard Straight, $10,000. Among the others were Medill McCormick, $1,000; Alice H. Longworth, $600; Thomas A. Edison, Charles Scribner and R. R. Quay, each $500; E. W. Bok and Mary E. Pinchot, each $100. There were 92 who gave $50, and 170 whose contribution was $25. The number of those giving $1 was 4,687, and there were two contributions of 10 cents. The largest items of expenditure were as follows: Sent to thirty-seven State committees, $95,563; salaries of employees, $32,713; printing, $58,444; stationery, $9,573; telegrams, $10,298; speakers, $45,665; rent, $6,242; advertising, $20,565. The Democratic National Committee's receipts were $678,364, from 53,363 persons, 52,246 of whom gave less than $100. By Justice James W. Gerard the largest sum, $13,000, was contributed. Among those who gave $10,000 were Jacob Schiff, Samuel Untermeyer, James Speyer, Charles R. Crane and F. C. Penfield. In the $5,000 group were Nathan Straus, Rolla Wells and Roger C. Sullivan. Ralph Pulitzer gave $2,000. Contributions of $1,000 were received from Perry Belmont, E. C. Benedict, William F. Sheehan, William J. Bryan and others. L. D. Brandeis and Woodrow Wilson are in the list for $500 each. Governor Dix gave $100. No sum whatever was credited to Thomas F. Ryan or August Belmont, who gave $700,000 in 1904. The expense list resembled that of the Progressive party. To States $121,489 was sent, and the cost of speakers was $130,870. The Republican Committee's receipts were $591,032. At the head of the list were Charles P. Taft, $56,000; F. L. Leland, $50,000; Andrew Carnegie, $35,000; and J. P. Morgan & Co., $25,000. In the $5,000 group were the names of Edwin Gould, J. W. Seligman, Otto T. Bannard and George Lauder. Henry C. Frick gave $2,000, and $1,000 was the contribution of Robert T. Lincoln, Charles Lanier, H. W. Taft, Frank Hitchcock and Mrs. Russell Sage. For advertising and publicity $232,000 was set down in the expense list, and $53,000 had been paid for speakers.——An unofficial estimate of the pre-convention expenditures made in the interest of candidates has been published, as follows: Mr. Roosevelt, $836,015; Mr. Taft, $378,000; Governor Wilson, $219,104; Governor Harmon, $150,964; Mr. Underwood, $51,951; Speaker Clark, $45,948.——Several witnesses testified before the Senate committee last week. Thomas F. Ryan said that he contributed $50,000 at the beginning of the campaign in 1904; that within a short time he added $50,000, and after the campaign had collapsed he added $350,000 to pay the committee's debts and save the Democratic organization. He had decided, even before the nomination was made, that Judge Parker could not be elected. He paid the money with no hope of reward. He had recently contrib-

uted about $75,000 for the benefit of Governor Harmon, and had given about $30,000 to Mr. Underwood's fund. George W. Perkins testified and repeatedly became much excited, denouncing Senator Penrose, Mr. Hilles and others. He was frequently at variance with members of the committee. Among the subjects touched upon during the inquiry were the Harvester Trust suit and the contribution of the New York Life Insurance Company's money. He had given $122,500 for the pre-convention campaign of Mr. Roosevelt, he said. It was shown by other witnesses that work in the interest of Mr. Roosevelt was begun in December last. Senator Penrose was invited to assist the movement. He

MR. DEBS, THE SOCIALIST NOMINEE FOR PRESIDENT, IN ACTION

LINED UP FOR THE FINALS

asked for ten days' time, it was asserted, and then declined the invitation.——Cyrus H. McCormick's contribution of $12,500 for the promotion of the nomination of Governor Wilson has been returned to him. The Governor says this was not done at his request, but at the suggestion of Cleveland H. Dodge, whose opinion was that no one should be able to say that the Governor had been aided by money given by a representative of a corporation with which the Government was or might be in litigation.——It was shown by several witnesses, one of them being ex-Senator Beveridge, that the latter received for use in his campaign in 1904 the following sums: From George W. Perkins, $30,000; from E. L. McLean, $25,000; from Gifford Pinchot, $2,500, and that all of this money he returned to the contributors immediately after the election. They were his intimate friends. He had not cashed the checks.

Course of the Campaign

Mr. Roosevelt arrived at his home in Oyster Bay on the 22d. His physicians said he needed rest and quiet, but he longed to resume his work in the campaign. Three days later it was thought that he might be able to speak for twenty minutes on the 30th at a public meeting in New York. The 26th was his birthday. He was fifty-four years old. Hundreds of congratulatory messages were received at his home. He walked a short distance in the open air. He has sued, for libel, George A. Newett, of Ishpeming, Mich., publisher of *Iron Ore,* a weekly paper, in which it was said of him, two or three weeks ago: "He gets drunk, not infrequently, and all his intimates know about it."——In published interviews Mr. Taft has deprecated the use of personalities in campaign work. Writing to John Wanamaker, he urged that voters should preserve our prosperity by supporting the protective policy and by declining to experiment with Democratic tariff theories. In a letter to the Hardware Association he spoke of his veto of the bill revising the metal schedule:

"I vetoed the bill, which would have spelled ruin to many of you, because I was unwilling to approve legislation which vitally affected not only millions of workingmen and the families dependent on them, but hundreds of millions of dollars' worth of stocks of goods in the hands of storekeepers and distributors generally, without first providing for a careful and disinterested inquiry into the conditions of the whole industry. We must not make legitimate business the football of politics."

Seven Governors replied to his recent

letter, expressing approval of his suggestion concerning the establishment of mortgage banks for farmers. Attorney-General Wickersham, speaking at Circleville, Ohio, said that Dan R. Hanna's interest in the Roosevelt third party movement was born in April, 1911, when he was indicted for rebating. "Hanna was highly indignant," he continued, "and sent a thinly veiled threat to President Taft that if the indictments were not dismissed his influence and that of his papers would be thrown against the President." Fines of $123,000 were paid. Mr. Hanna has expended $177,000 in support of the Roosevelt movement. ——Referring to a report that he had decided to call an extra session of Congress if he should be elected, Governor Wilson said he had not given a thought to the question. It has been erroneously asserted that he recently became a member of the Knights of Columbus. In a letter to Mr. McAdoo he denies this, saying he has not been asked to become an active or an honorary member, and is not eligible because he is not a Catholic. He adds:

"I am a normal man, following my own natural courses of thought, playing no favorites and trying to treat every creed and class with impartiality and respect."

The New York *World* (Democratic) publishes the results of a canvass indicating the election of Wilson. It gives him 325 of the 531 electoral votes and a popular vote of 7,024,000, against a Republican vote of 7,920,000, of which Taft has 58 per cent. and Roosevelt 42 per cent.

Conviction of Lieutenant Becker

At the end of the trial of Lieutenant Charles Becker, of the New York police force, on the 24th, he was found guilty of murder in the first degree. The charge was that he instigated and procured the murder of Herman Rosenthal, a gambler, in July last. Three of his accomplices or agents testified against him. They had been concerned in the employment of the four "gunmen," now in custody, who shot Rosenthal. The trial consumed nineteen days, and the jurors were out seven and a half hours. Four of them at first voted for a verdict of guilty in the second degree. Becker will appeal, of course. It is said that decision on the motion for a new trial cannot be reached within three months, and that, if the motion be granted, Becker cannot be brought to trial again in less than a year. The men who shot Rosenthal are soon to be tried. It is reported that at least one of them is seeking an agreement by which his life may be saved.

Collapse of the Diaz Revolt

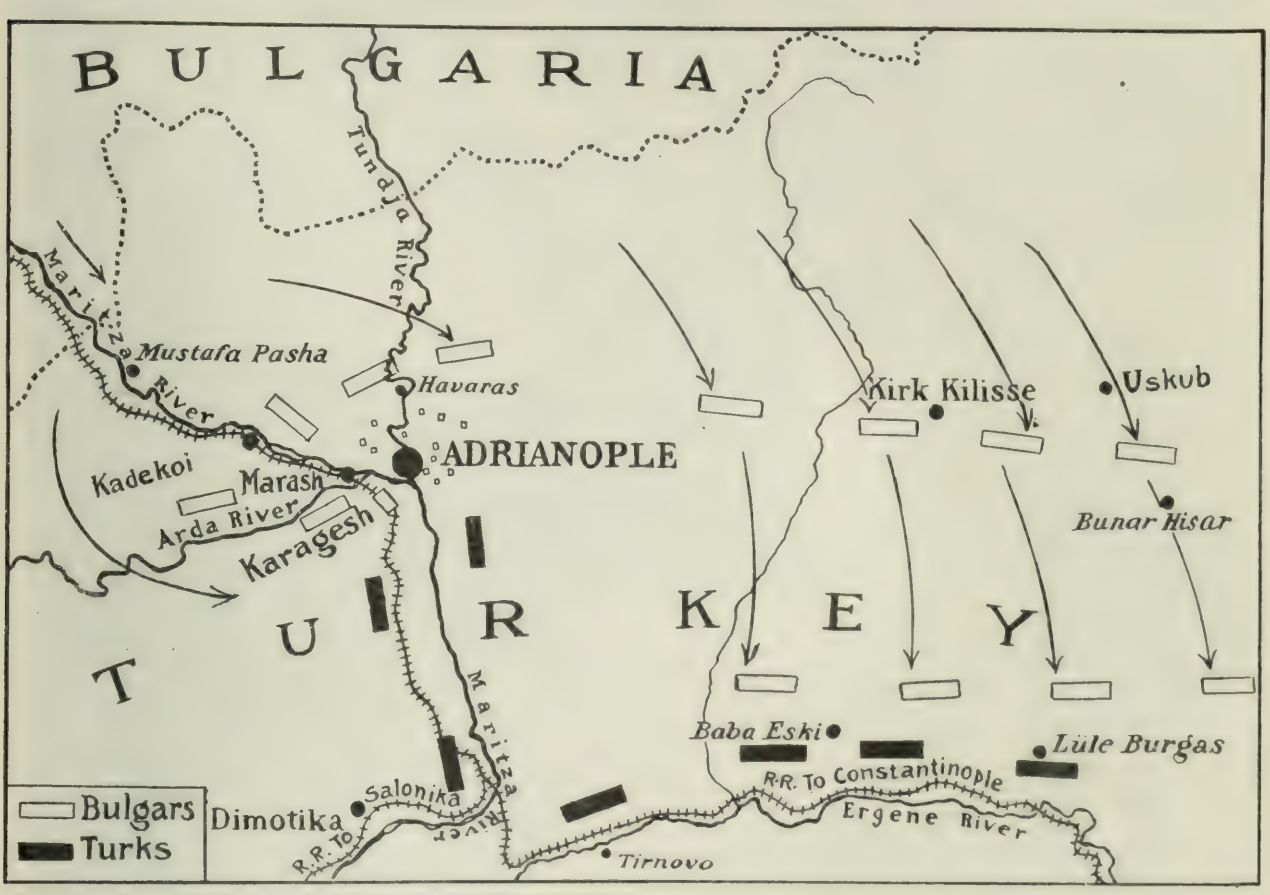
Felix Diaz's revolutionary movement in Mexico ended suddenly and unexpectedly on the 23d, when Federal troops, led by General Beltran, easily captured Vera Cruz, Diaz himself, and his army. This collapse of the revolt caused much surprise at Washington, for the movement was regarded as one that promised to be successful. Preparation for a great battle had been made. Fifteen thousand residents of the city had sought refuge on ships in the harbor. On the 22d Beltran politely asked Diaz to surrender, and, when Diaz with equal politeness, declined to do so, gave notice of a truce until the following morning. When the truce expired, Beltran's army entered the city and easily took possession. It was all done in two or three

GENERAL FELIX DIAZ

hours. There was little fighting and the casualties were few. The rebels fled to the barracks, where they surrendered, with Diaz and his staff. It is said that Diaz fell into a trap prepared for him. For some time he had been under suspicion, and among the advisers around him were several of Madero's agents. He was led to believe that the greater part of the army would join him. His men say he told them that Beltran's soldiers would enter the city only to come under his flag. Therefore they offered little or no resistance. In a telegram to the American press, Madero said:

"The Federal troops' easy capture of the important port of Vera Cruz, with Felix Diaz, the commander of the rebel movement there, insures the speedy pacification of the entire country. Foreigners are assured of complete protection of their lives and property thruout the republic. It may be taken for granted that the period of trouble thru which the country has passed is practically at an end."

At once there were trials by court martial. It was at first reported that on the 25th, Majors Zarate and Cuesta, of Diaz's staff, had been sentenced and shot, and that on the following day the lives of Lima and Migoni, also of the staff, had been taken. This was not true. Great efforts were made to save Diaz. A Federal court ordered that his case be transferred to a civil tribunal for investigation. For two months he had not been an officer of the army. Six hundred students pleaded for him with Madero, who declined to interfere. "If Juarez," said he, "could have shot Porfirio Diaz Mexico would have avoided thirty years of tyranny. Felix is a traitor, like his uncle." The Senate asked Madero for a report about the Diaz movement. He refused to give one, but advised the Senators to send a committee to Vera Cruz. Diaz, at his trial, said he alone had been responsible for the revolt. It appears that he had chosen General Trevino to be provisional President. The general is in command of the Monterey Military Zone. This choice had been approved by Orozco. There were two battles with rebels in Durango last week, and one in Chihuahua, but the Zapatists, in the south, were quiet.——On the 27th the military court condemned to death Diaz, Major Zarate, Colonel Migoni and Lieutenant Lima, and sentenced three other officers to be imprisoned for ten years. General Beltran did not ignore the civil court, but accepted writs of habeas corpus for Diaz and Zarate. The execution of their sentences was suspended.



Political Riots in Cuba On November 1 the Cuban people will elect a President, a Vice-President, members of Congress, Governors of States and officers of many municipalities. President Gomez is not a candidate. The Liberals have nominated Vice-President Zayas, and the Conservatives' nominee is General Mario Menocal. There is much excitement and there have been several riots. On the 25th, in the evening, a large mass meeting was held by the Liberals in Havana's Central Park. At the close of it, a little after midnight, there was a battle between the Conservatives and the Liberals. Several hundred shots were fired. Forty persons were wounded, two were killed, and several of the injured cannot survive. Mounted police and cavalry charged upon the mob, there were many shots from the windows of houses, the Liberals attacked the house of the Asbert Club, the house was defended by gunmen in the balconies, and much time passed before peace was restored. The same night there was a riot at a Conservative meeting in an outlying boro. Charles Aguirre, chief of police, a Zayas partisan, was displaced on the following day by Colonel Pujol, a soldier of good repute, but the influence of Dr. Zayas and of Speaker Ferrara (Aguirre's brother-in-law) caused the speedy withdrawal of Pujol, who was succeeded by General Mendieta, an earnest Zayista. The Conservative newspapers say that there should be no more political meetings, and some think it will be impossible to hold a fair and peaceful election. The Asbert Club is supported in the interest of General Asbert, Conservative candidate for Governor of Havana. After the riot the club house was searched by the police, and several members were arrested.——The commissioners (General McIntyre, of the War Department, and W. T. Doyle, of the State Department) who accompanied 750 marines to Santo Domingo recommend that a general election be held there. President

Victoria, who could legally remain in office until 1918, announces by proclamation that he will retire in July, 1914, and that an election will be held in the preceding May. His nephew Alfredo, Minister of War, and really the head of the Government, is to retire from the Cabinet at once. Cordova, Minister of Finance, whose course has been criticised, will also withdraw. Amnesty is offered to all rebels, political prisoners are to be released, and exiles are invited to return. Late reports show that the revolution is spreading and becoming more formidable.——At the Lake Mohonk Conference, last week, Major Finley, Governor of Zamboanga, said that all efforts to evangelize the non-Christian or Mohammedan inhabitants of Mindanao and adjacent Philippine islands were doomed to failure. The education of these people, he argued, should be exclusively industrial.——Pirates are at work again in the Sulu archipelago, and the Government at Manila has ordered the construction of a fast armed cutter to be used in pursuing them.

South America In Ecuador, the revolutionists, led by Colonel Saavedra, who fought with Alfaro in an unsuccessful revolt a few months ago, have attacked and captured the city of Limonez. Our Government has reached an agreement with Ecuador for the sanitary improvement of Guayaquil, a port which has been called "the pest hole of the Pacific." A preliminary survey will be made by American experts, and the expenses will be paid out of the fund appropriated for sanitary work in connection with the construction of the Panama Canal.—— The Historical Institute of Lima has protested against a contract made by Peru's Minister of Instruction, which gives Yale University exclusive privileges for archæological exploration and excavation. The protest has been referred to a committee of Congress.—— Train service on the Trans-Andean railroad was resumed on the 22d, after a suspension of five months, due at first to snowdrifts forty feet deep, and afterward to avalanches which buried the track. ——An army of brigands has attacked and defeated the police in the Brazilian State of Parana, killing forty of them. Troops have been sent to Parana by the central Government.——Venezuela, our Minister, Mr. Northcott says, is enjoying great prosperity, owing to long continued freedom from revolutionary disturbance. Many public improvements have been made. A dozen young Americans, graduates of scientific schools, are exploring the country in search of deposits of oil and gas.——It is expected that American marines will assist the Government of Nicaragua in guarding the polls at the Presidential election on November 2.——A ship will pass thru the Panama Canal, it is said, on October 23, 1913, altho the formal opening will take place on or about January 1, 1814.

Bulgars Capture Kirk-Kilisse The allied Balkan states have astonished the world by the swiftness and success of their attack on Turkey. They concluded a secret alliance, mobilized with unexpected celerity, invaded Ottoman territory almost simultaneously from the north, the west and the south, and have so far met with no defeat or serious check. During the second week of the war the Bulgarian, the Servian and the Montenegrin armies each captured important cities. Of these three movements the first is of greatest interest, for if it continues to be successful it will result in the taking of Adrianople and the seizure of the railroad 20 miles to the south of it, thus cutting off Macedonia from Constantinople. A glance at the accompanying map will make the movement plain. The Bulgarian army following the railroad entered Turkish territory at Mustafa Pasha and, as was anticipated, advanced upon Adrianople from the northwest. But what apparently was not anticipated by the Turks was that the blow was not delivered from this quarter but 32 miles to the eastward at Kirk-Kilisse (Kilissi or Kilisseh). The Bulgarian line extended as far east as Uskub (not to be confused with Uskub in Macedonia, captured by the Serbs), so Kirk-Kilisse was attacked simultaneously from the northeast, north and northwest. The Bulgarian infantry pushed forward with the greatest eagerness, sometimes, like the Montenegrins, getting into the way of their own artil-

lery. On Wednesday night, taking advantage of the moonlight, the Bulgars began at 10 o'clock to force their way thru the vineyards on the north of the city, fighting with bayonets step by step into the streets, until by 10 o'clock the next morning they were masters of the place. The defenses of Kirk-Kilisse had been planned by the German officers in the Turkish army and were thought to be very strong. According to Turkish statements 150,000 of their troops were massed about Kirk-Kilisse. Many of these retreated during the night in the direction of Bunar-Hissar, hotly pursued by the Bulgars. The main force retreated to the Ergene River. Here the new line of defense is drawn up between Baba-Eske and Sule-Burgas in order to protect the railroad connecting Constantinople with Adrianople and Salonika. The Bulgars claim to have taken 1,200 prisoners at Kirk-Kilisse as well as fifty-eight guns, two aeroplanes and a large quantity of ammunition. Mukhtar Pasha, who was in command, escaped, tho with the loss of part of his baggage, but his son was captured. The losses on both sides were very heavy, that of the Turks is estimated at 15,000 and that of the Bulgars at 5,000. If, as last reported, the Bulgars have actually taken Baba-Eske, it will be hard to keep them off the Orient railroad.——Meanwhile General Ivanoff was engaged in enveloping Adrianople by sending troops down both banks of the three rivers uniting at that point, until the Bulgarian line wrapt around the city from the eastern side of the Tundja to the southern side of the Arda. With hard fighting at such outposts as Havaras, Kadekoi and Maras, the Turkish troops were driven in until now the Bulgarian artillery is stationed on the hights within range of the city. The Bulgars even hold Karagesh, the railroad station of Adrianople, just across the Maritza River. The Turkish garrison is estimated at 60,000.

Serbs Capture Uskub

The Servian army, advancing from Vranya along the railroad encountered the enemy in force at Kumanova, ten miles from Uskub (Uskup). The Turks numbered about 25,000 men, including the model cavalry regiment drilled by German officers and command-

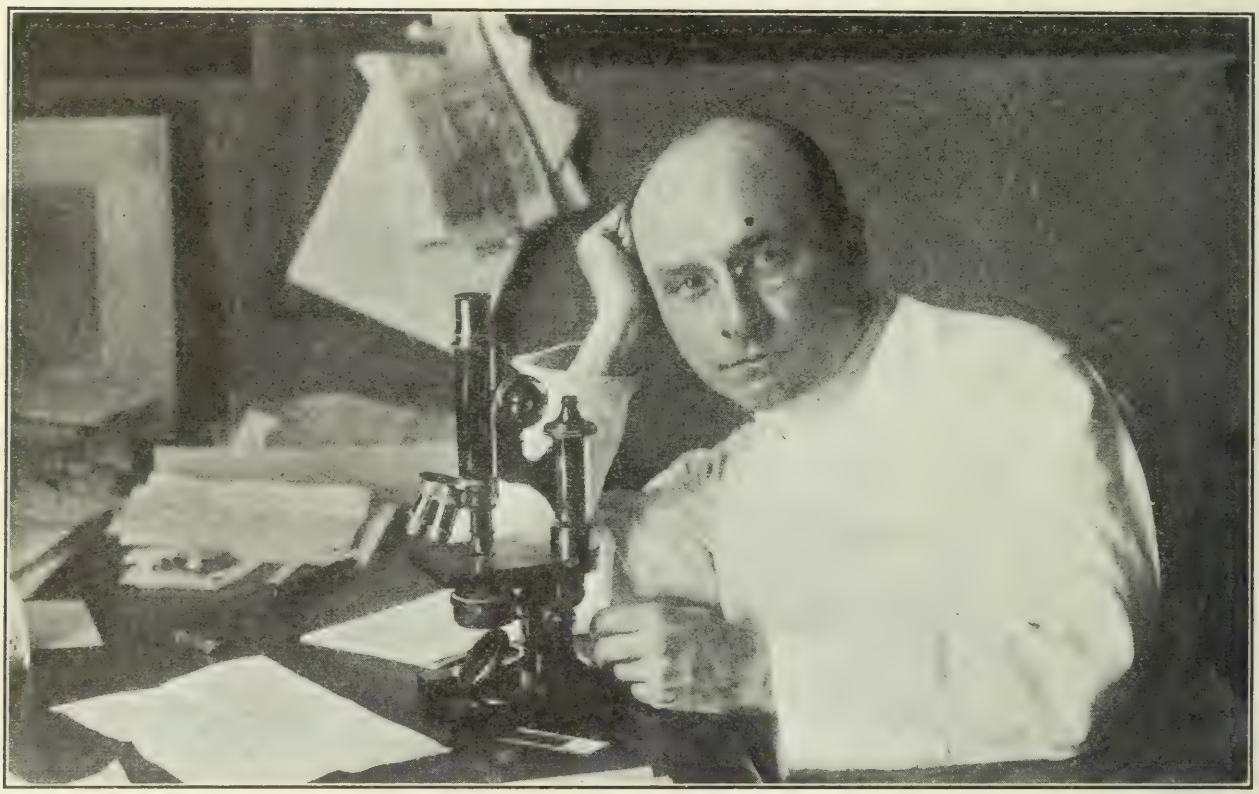
Copyright, Underwood & Underwood, N. Y

TURKISH ARTILLERY IN PARADE LAST SUMMER AT CONSTANTINOPLE

ed by Faik Pasha. The Servian artillery, under the personal command of the Crown Prince was employed with terrible effect, practically wiping out of existence three squadrons of the Turkish cavalry. In an all night engagement ending on Thursday morning the Turks were driven back to Red Rock, famous as a battleground between Christian and Moslem. Here the fighting was fiercest; first gunshot, then bayonet and finally knife and dagger. Five thousand Turks fell, killed and wounded, if we may accept the estimate of the Serbs, who

acknowledge a loss on their side of 2,000 killed and 900 wounded. The Serbs captured fifty-five field guns, six howitzers, six machine guns and two aeroplanes. The Turks retreated on Uskub and later surrendered that city without a struggle. This gives the Serbs the command of the railroad leading from the Sanjak of Novibazar to Salonika. They have also captured the city of Novibazar after three days of hard fighting, and have joined forces with the Montenegrins coming from Berana. This brings the entire Sanjak under the control of the allies and closes the passage by which Austria has long hoped to enter Turkey. ——The Montenegrins completed the investment of Skutari on October 24, and by the occupation of the forts of Tarakash (Tarabosh), which surrendered after a long bombardment, they gained a position overlooking the city from a hight 1,000 feet above the lake. Shells were dropt into the Mohammedan quarter until the panic-stricken inhabitants raised white flags on their houses.

Foreign Notes



The Czarevitch Alexis, the only son and heir of the Emperor of Russia, has been severely injured in the abdomen and for a time it was feared that his life was in danger. The Grand Duke Alexis was born August 12, 1904. The details of the affair are very mysterious. It is officially asserted with the utmost positiveness that the injury was the result of an accident, but various causes are alleged, one being that the boy fell from a high cupboard which he attempted to climb in the hunting lodge at Spala, where the imperial family was staying, and that in falling he struck against the sharp corner of a chair. Other official versions state that he fell from a pony, and that he slipt in the bathtub and struck the tap. According to other reports the affair took place, not at Spala, but on the imperial yacht "Standart," and the Crown Prince was injured either by a fall from a spar, or, as is more commonly believed, by a shot or dagger thrust from a terrorist. At any rate, Rear-Admiral Chagin, commander of the yacht, who was responsible for the safety of the Czarevitch while on the vessel, committed suicide by shooting himself. He filled the barrel of his gun with water in addition to the load and the discharge almost blew his head off. That the act was premeditated was shown by his care in arranging his affairs and making his will, which left $25,000 to his sweetheart, Helen Sokoloff. The girl, who is a college student, visited the flat of the admiral, and learning of his death, tried also to commit suicide, at first by drinking acetic acid from a bottle she brought with her, and when this was knocked out of her hand she attempted to cut her throat with the broken glass. According to rumors she is a revolutionist, and it was thru her intrigue that the admiral was absent from the yacht at the time when the attempt was made upon the life of the Crown Prince. —— France and Spain have agreed upon the partition of Morocco and a treaty is ready for signature. By these negotiations, which have been carried on for eight months, there is secured from Spain more territory than was accorded to her by the secret treaty of 1904. In consideration of the fact that France was obliged to cede to Germany a large area of her Kongo possessions in order to secure the withdrawal of German opposition to the French protectorate in Morocco, Spain agrees to give to France nearly 200,000 square kilometers in the Ifni region south of Agadir. The town of Tangier and a zone of 15 to 16 kilometers around it will be international territory because Great Britain did not wish the opposite side of the Strait of Gibraltar to pass into the hands of any single European Power. A railroad is to be constructed from Tangier to Fez by a Franco-Spanish company. Of the capital of this company France will supply 56 per cent., Spain 36, and foreign capitalists eight. The Sultan of Morocco will retain his honors and titles and will be represented in the Spanish zone by a khalif residing at Tetuan.——In the British Parliament, the Home Rule bill is being hotly debated. One of the points of attack is the apprehension that Gaelic will be adopted as the language of Ireland. An amendment prepared by Ian Malcolm to make English the sole official language of the Irish Parliament, courts and public services was defeated.

Dr. Alexis Carrel

Winner of the Nobel Prize in Medicine

BY JAMES J. WALSH, M.D.

Dean and Professor of the History of Medicine at Fordham University Medical School, New York.

opyrig ıt, B owa Bros.

THE announcement of the award of the Nobel Prize in Medicine for this year to a man who, tho not an American, has done all of his best work here in the United States, naturally attracts special attention. Dr. Carrel's principal scientific investigations have been carried out at the Rockefeller Institute, New York, and his announcements have been made in American medical journals and before our medical societies, where they met with the recognition they deserved. In spite of his French birth then, and even of the fact that he is with us much less than a decade, we think of him as one of ourselves.

There are a number of features in this award of the Nobel Prize for this year that are worthy of note. Attention has been called rather frequently to the fact many of those on whom the Nobel Prizes have been conferred in the last ten years were not, almost as a rule, the sort of persons on whom the founder of the prizes would apparently have planned to have them conferred. For Alfred Nobel, the great dynamite manufacturer, who founded this series of prizes, wanted to encourage scientific development. His idea was not so much to reward scientific authorities for the work that they had done or to bring consolation to great scientists in advancing years, but to stimulate and encourage younger men who had made the distinguished discoveries and to rouse them, if possible, to further good work. He knew that many a genius has his opportunities for original work hampered by material necessities which sometimes prevent the full development of his powers. These difficulties Nobel hoped to ameliorate.

Dr. Carrel is a young man; at least he is a man not yet forty, and for all those who are over forty that is surely young. He has the promise of a long career before him. His position at the Rockefeller Institute puts him above the hampering call of material necessities, but the $40,000 of the Nobel Prize will undoubtedly be welcome and ought to provide thoro stimulus and encouragement for the development of every effort and

faculty of the man on whom it is conferred.

There will naturally come to the Rockefeller Institute a good deal of *kudos* because of this award to one of its workers of this greatest of present day distinctions in science. The Rockefeller Institute itself is doing such good work, has been developed along such broad lines, and in general has so well carried out certain ideals of a medical investigating institution that those who are acquainted with it in its details of work will rejoice particularly over this merited recognition. Probably nowhere has Mr. Rockefeller invested money so productively for the good of the race as in this New York institution. I believe that it was founded originally because of the impelling desire to investigate certain diseases and especially diseases among children, after the death of a grandchild. The loss of that little life in the millionaire's family is probably going to prove the saving of the lives of many, many children of families of all degrees, and the lengthening of the lives of many of maturer years. Others may well emulate the fine use to which Mr. Rockefeller put his money when he founded the Institute with such liberal policy that its possibilities for good are enormous.

The man who deserves particularly to be congratulated on this award of the Nobel Prize to Dr. Carrel is the medical director of the Rockefeller Institute, Dr. Simon Flexner. Dr. Flexner himself is a distinguished medical investigator, a discoverer of many important phases of bacteriological progress in recent years, but he is much more than that, he is an administrator of high degree and a knower of men of special ability. It has often been said that perhaps the most difficult art is to recognize the possibilities of development among young men and secure budding genius so as to encourage and foster its work. The Carnegie Institution had this for one of the special features of its foundation, for Mr. Carnegie recognized how much it would mean for human progress. Dr. Flexner, at the Rockefeller, however, has succeeded in fulfilling this important social need all by himself. His recognition of Dr. Carrel's ability receives its due appreciation in this award of the Nobel Prize within six years of Carrel's coming to America. How much this means for the institution will be best understood from the fact that it is said that more than one European institution, notably the Pasteur Institute, has suffered in its productivity because of failure to recognize promising talent and give it opportunity.

Dr. Alexis Carrel was born June 28, 1873, in Lyons, France. He was educated at the University of Lyons, receiving his degree of B. L. in 1890 and B. S. in 1891. He did not receive his degree of Doctor in Medicine until 1900. Dr. Carrel's academic degrees came earlier than would be possible in this country,

THE LATEST NOBEL PRIZE WINNER

but his degree of Doctor of Medicine was delayed until he was twenty-seven, and his medical studies were evidently made after thoro preparation. He was connected with the University of Lyons for some years after his graduation, and while there published a monograph on "Cancerous Goitre" (*"Le Goitre Cancéreux,"* Lyon, 1900). This is a very careful study of an affection usually considered quite rare, but which the careful study of some eighty-three cases shows to be relatively frequent. This first contribution to medical literature was much more than the conventional thesis of the graduate in medicine, and will hold a place in our recent literature.

His first work in America was done at

the Hull Physiological Laboratory, University of Chicago. In the latter half of 1905 two papers, written in collaboration with Dr. C. G. Guthrie, appeared in *American Medicine* and attracted wide attention from those who are intently watching for new lines of investigation in medicine. The first appeared in August, 1905, on the "Anastomosis and Transplantation of Blood Vessels," the second in December, was on the "Transplantation of Veins and Organs." A new field of research was thus opened up, and then there came the striking paper in *The American Journal of the Medical Sciences* for 1906, by the same two men, on "Amputation of the Thigh and Its Replantation," showing the possibility of having the whole series of structures in the leg grow together after complete separation. This was not an entirely new idea, but it was so far in advance of anything that had been thought possible before as to prove startling. There are a number of cases on record in which a considerable portion of a finger has been cut off by some sharp instrument, replaced carefully, and has grown on again. Ears have been refastened to the head after removal accidentally and have become successfully reimplanted. That a whole limb should be removed and then be reimplanted seemed almost out of the question.

After this there came another interesting development of Carrel's work, now in the "Proceedings of the Rockefeller Institute," to which he had become attached. His studies in the transplantation of veins and organs seemed to have no practical bearing, because it would apparently be impossible to have a portion of another healthy vein to use for such transplantation purposes. Carrel showed by his article on "The Heterotransplantation of Blood Vessels Preserved in Cold Storage," published in 1907, that it was possible to preserve portions of veins and arteries in such a condition by cold storage that the ordinary death changes did not occur in them and that they could be grafted on to arteries or veins successfully. This showed at once the practical value of this line of work, for it would be perfectly possible for surgeons to be able to obtain such grafts as they might need from the healthy bodies of those who had been killed by accident. These might be preserved until needed. The idea of having a portion of another's tissue grafted on to us is not a very pleasant one, but the possibilities of successful surgical relief for conditions threatening life would soon outweigh that sentiment.

In 1908 there came the description of the successful transplantation of kidneys from one animal to another. In one case at least both kidneys were successfully transplanted and the animals not only survived, but remained healthy. In one of these cases a rapid calcification of the arteries of the animal took place, showing that there was some element in kidney function which had been interfered with and which when disturbed led to serious degeneration of arteries. One of the most interesting problems in modern medicine is the question of premature senility consequent upon degeneration of arteries. The place of the kidneys in this had not been clear before, and this was a distinct contribution to etiology.

In 1909, 1910 and 1911 papers were written showing further developments of the work on transplanting and repairing blood vessels. For instance, it was shown that so important a blood vessel as the aorta might be repaired by using a piece of peritoneum as a patch. Somehow Nature is able to make use of such heterogeneous elements. The study of the "Latent Life of Arteries," in 1911, showed that while arterial tissues might be killed by various physical and chemical agencies and then react as dead material when attached to a living body, portions of arteries carefully removed and placed in cold storage might well retain life, tho without exhibiting any of its manifestations except that when attached to living tissue it was accepted kindly and not rejected as dead matter.

In 1911 came the "Cultivation in Vitro of Thyroid" and then of various other tissues; that is, the demonstration of the growth of the cells of various organs when placed upon proper nutritive media in glass or other vessels. For instance, portions of thyroid placed on plasma of an animal corresponding to that from which the organ had been removed actually grew, that is, cells gave birth to new cells and new tissue was formed. The connective tissue grew more than the epithelian cells, but the two elements actually

increased. Dr. Carrel called attention to how much this might mean for the study of the internal secretions in men, one of our most difficult and important problems in modern medicine.

During the past year his work has been on the preservation of life in cold storage. It has long been known that the heart of many of the lower animals continues to beat for a considerable time after the animal's death. The frog heart, for instance, may easily be kept alive for hours or even days. The same thing is true for practically all of the cold-blooded animals. It was known that in warm-blooded animals stimulation might give rise to a short series of beats of the heart after the death of an animal. It was left for Dr. Carrel, however, to demonstrate that portions of the heart of warm-blooded animals might be stimulated into activity for a long time after the death of the animal, indeed almost indefinitely if kept under conditions in which exhausted material was removed and some nutritious material supplied. Portions of the heart of the chick, for instance, might be thus made to beat after removal from the body, and then if kept in cold storage the renewal of the beating might be brought about by stimulation after long intervals. As to how long life in the heart might be thus retained has not yet been decided, but it seems possible for an indefinite period to reawaken this functional vital activity under favorable conditions.

Almost needless to say, the publication of these results attracted wide attention. The promise of such discoveries is very great. The work opens up vistas as significant as those which came when Virchow established cellular pathology and Pasteur laid the foundation of bacteriology. Many of the ideas are so unfamiliar that to most people they seem impossible, but it can be readily understood that these are just the sort of discoveries that after a while will seem almost obvious. All great discoveries are said to run the gamut from the impossible to the obvious. The giving of the Nobel Prize will doubtless stimulate the discoverer to the full development of his fine scientific investigating spirit, and we may look for an evolution of these basic truths to a new science of life.

Carrel's work has not been due to flashes of genius or brilliant ideas that luckily worked out into scientific demonstrations. He is above all a tireless, faithful worker. Most of whose work has doubtless led nowhere and seemingly was wasted, but some of which has proved to have fine results. Perhaps the best idea of his faithfulness to his tasks may be gathered from the experience of reporters the morning after the announcement that the Nobel Prize had been conferred on him was made. All those who called up to secure personal details of his history were informed that he was in the midst of an important operation which would take several hours and that he could not be disturbed. He might be seen after 2 o'clock, but not during the morning hours. It might be expected that the morning after the blue ribbon of the scientific world came to a man under forty, that he would take a day off or at least not occupy himself with such a serious laboratory procedure as would prevent him from seeing friends and reporters. Dr. Carrel's arrangement, however, had been made to do this work on Friday morning, and it was done. He was interested in it, but it was much more a sense of duty that sent him to his laboratory on what must have been one of the happiest days of his existence.

Personally Dr. Carrel is very far from the kind of man so often pictured as the typical scientific investigator. He is far more than ordinarily interested in literature and sociology. There are many deep philosophic questions that he has thought of much more than superficially, and he is particularly interested in certain phases of psychology. The question of the influence of the mind on the body, especially in all that relates to medicine, and the wonderful cures even of definite physical conditions that sometimes follow strong influence exerted upon the mind have always had special attraction for him. Those who know him intimately think of him as a charming man of the world, without any of that abstraction or self-absorption that is supposed to characterize the man who takes the step across the borderland into the unknown in science, and makes a path along which others may easily follow.

New York City.

A Helping Hand to Commerce

BY CHARLES NAGEL

Secretary of Commerce and Labor.

OWING to the excitement which has attended the Presidential campaign, a number of measures of very considerable importance just enacted by Congress have not received deserved attention. In fact, it appears to be one of the purposes of this intensely personal campaign to divert public attention from the consideration of this Administration's record of very unusual accomplishments.

Among the measures which under normal conditions would no doubt have been extensively noticed is the consolidation of the Bureaus of Manufactures and Statistics in the Department of Commerce and Labor under the title of Bureau of Foreign and Domestic Commerce. This consolidation had been suggested during the last Administration, and was recommended by President Taft. Just when hope of success was about abandoned, and when a proposed transfer of the Bureau of Manufactures threatened its practical destruction, the consolidation was effected by a clause in one of the appropriation bills. While no essentially new authority is conferred upon this new bureau, it is nevertheless true that in its present organization this bureau represents the first distinct recognition of the part which the Government should play in the development of foreign and domestic commerce. The new title expresses this, and clearly indicates the purpose of the authority which up to this time had been distributed among two or more bureaus, and had been correspondingly ineffective. As now constituted, the activities of the bureau are practically to be measured by the appropriation. Assuming that Congress will hereafter supply the means, there is no reason why the Government should not now do for the promotion of general commerce what has been successfully done for agriculture.

It is not generally understood in how limited a sense our Government has been active in this field, altho of late very gratifying progress has been made. For a long period we provided general protection against foreign competition, and looked to commerce to do the rest. Within a few years the Consular Service has been reorganized, and now constitutes a very effective force for the collection of information of value to export trade. Now the creation of the Bureau of Foreign and Domestic Commerce, if properly sustained, will be in a position to render assistance at least similar to that which foreign governments extend to their foreign trade. This bureau, if it is provided with a proper force of commercial agents, will be in a position, by the publication of the reports made by these agents, and by consuls, to place in the hands of all our industries the information which is essential for the development of foreign trade. Even then the relation between Government and commerce will not be as close as it is, for illustration, in Great Britain, Germany and France; but we have probably gone as far as we can or should under our system.

At the same time, it is well to remember that greater reliance upon export trade presents other problems for solution. The very improvement just referred to will give prominence to shortcomings in other directions. For illustration, we lack a merchant marine. It is sometimes contended that we are fully accommodated by foreign ships, which are as ready to serve us as they are the patrons of the countries under whose flags they sail. This may be doubted. In cases of close competition, when rates control, it can hardly be questioned that the foreigner must have an advantage, particularly in those countries where the control of governmental agencies over common carriers is great. We fully appreciate the importance of equitable rates to the normal development of domestic trade. Obviously, the same factor must be guarded if foreign trade shall be conducted and extended under similar conditions; and unquestionably the most potent force for equitable rates would be competing carriers over whom our Government has undoubted jurisdic-

tion. The provision to admit foreign-built ships to American registry, and the admission of free material for ship building, are steps in the right direction. If these measures do not alone accomplish the desired result, they may at least point out what else is needed to accomplish what, by general consent, we must have —a merchant marine.

Again, the organization of large business is in need of immediate attention. In all the discussion that has been had about the anti-trust law, and the need for further legislation to authorize and to regulate concerns engaged in large business, we apparently have had in mind only domestic interstate commerce. It is true that the need for constructive legislation in this field is pressing enough. But how much more urgent is that need with respect to international business, now that export trade is made more and more our reliance, as the demand for lower import duties is growing stronger and stronger. We have been content to regard great questions from the domestic point of view only, but we shall have to modify our attitude, politically and commercially speaking. The question is not solely what we may regard as wise in making rules for competition at home. The question has become, what kind of competition may be forced upon us from abroad; not how large a concern we may wish to tolerate at home, but how powerful a concern may be sent into the field of foreign competition against us. We may still discuss theories, but we shall have to deal with conditions. Our legislation must be so framed as to allow of organizations that may satisfactorily serve us at home and successfully represent us abroad. Investigations and reports for campaign purposes will not answer that situation. We shall have to study conditions in other countries, and if we are not prepared to pattern our policy upon theirs, we shall at least have to invent a new one that may challenge theirs.

Finally, there is one more important condition to the successful extension of our trade, and that is a reorganization of our trade bodies. At present we still have boards of trade, chambers of commerce, business men's leagues or similar associations of one name or another in most cities. There is a strong movement in some cities to concentrate organizations, and in a few this purpose has been accomplished, with marked advantage to these cities. The saving in energy, the effectiveness of harmonious and well directed effort can not be disputed. But what is true of cities is equally true of whole States, and indeed of the entire country. We need a National Board of Trade—a truly representative body whose counsel may be sought with confidence by the executive and legislative branches of the Government in all matters of national commercial concern. Such a body could secure an enormous saving by the prevention of unintentional mischief and by the promotion of much needed general legislation. As special legislation has done much injustice, so general legislation may furnish great relief.

This is the meaning of the Chamber of Commerce of the United States which was organized in Washington this year. It is only a beginning, but it starts with a support from commercial bodies thruout the country that promises success. Without destroying or discouraging individual enterprise, ambition or resourcefulness, without denying these their legitimate triumphs, there must be impressed upon the people the idea of commercial patriotism. We must learn to understand and to support the common cause. We must grasp that foreign countries triumph today not so much by the organization of armies as by the organization of their commercial forces, who are trained like students and who press forward like soldiers to have their country excel and win. With commerce and industry so organized and the Government's Department of Commerce properly supported, we have a combination which will be the nearest approach feasible in our country to the systems which prevail in other countries. Here as elsewhere it will be well to bear in mind that it is not so much the system that brings happiness or unhappiness, success or failure. It is the spirit of the people that gives life and purpose to the system. We have the plan for intelligent co-operation between Government and business. What we need is the determination to employ our opportunity.

WASHINGTON, D. C.

The War in the Balkans

BY GEORGE WASHBURN, D.D., LL.D.

Ex-President of Robert College, Constantinople.

IT has long been obvious that this war was inevitable unless the great Powers could agree to compel the Turkish Government to grant some form of autonomous government to Macedonia. This was agreed to in the treaty of Berlin, but the Turks declined to carry out the provisions of the twenty-third article and the Powers could not agree to enforce it. They have since brought diplomatic pressure to bear upon Turkey in various ways—but Sultan Hamid was too clever for them. Since his dethronement they have done nothing, trusting to the promises of the new Young Turkey Government. During all these years there has been a reign of terror in Macedonia, which has not only been a disgrace to Europe but has aroused the indignation of the neighboring Christian states and forced them at last to take up arms to save their brethren from extermination. The Christians of Macedonia are of Bulgarian, Greek and Servian races and akin to the Montenegrins. Nothing more remarkable or unexpected has happened in Europe for many years than the alliance of these four rival states to fight the Turks. Nothing could have brought about such an alliance but the cold-blooded neglect of the great Powers to listen to the cry of Macedonia. The Balkan people have listened to this cry until they could stand it no longer, and they have forced their rulers to unite and declare war. What the end of it all will be no one can foresee, but while it lasts it will be a bloody and desperate conflict.

The Turks have gone into the war with light hearts and wild enthusiasm. The declaration of war was welcomed in Constantinople with as much joy as the revolution of 1908. They feel sure of victory, and nothing could please them more than the opportunity to crush these states, which once formed a part of their Empire. Whether they win battles or lose them they will fight until a European intervention compels them to desist, and we can hardly blame them, for they feel that they are fighting for the existence of their Empire. The prime motive of the revolution of 1908 was the hope that the adoption of a constitutional form of government would put an end to European interventions and the gradual dismemberment of the Empire, and thus restore and perpetuate the Turkish power. The action of the great Powers at the time confirmed their hopes. I think that the leaders honestly believed that they could hold the power and at the same time inaugurate a period of good government with equal rights for all—which would satisfy the people and the world. In all this they failed, and a few months ago another revolution destroyed the power of the Committee of Union and Progress, which had misgoverned the country for four years and had done nothing for Macedonia. The revolution and the constitutional government have failed to strengthen the Empire. Europe has allowed the Balkan states to declare war, and there is nothing left for the Turks to do but to fight to maintain the integrity of their Empire.

That is the Turkish view of the present crisis—at least the popular view. I do not think that the present ministry wished for war. They knew the truth of what a venerable old Turk once said to me—"Whenever the pot boils in Europe and blows off the cover it always falls on our heads." If they had dared to do it they would have made great concessions in Macedonia and quieted the Greeks by giving up Crete. The threat of a war in the Balkans enabled them to surrender Tripoli and make peace with Italy. But the Committee of Union and Progress was still strong enough to threaten the overthrow of the present government if any concession was made to the demands of the Balkan states in Macedonia. They cried out for war and roused all the fanaticism of the Moslem population.

The European Powers might have prevented the outbreak of war if they

could have agreed upon any form of intervention. No one of them desired a war in the Balkans. The *summum bonum* in their eyes was the *status quo*. They threatened the Balkan states. They cajoled Turkey, but they did nothing. A late number of the London *Times* contains an elaborate explanation and apology for their inaction, entitled "The Limitations of the Powers." An extract from this is worth quoting, for it involves a very honest confession of the weakness of what is known as the Concert of Europe:

> At first sight it seems inexplicable that the Powers should delay at all in taking whatever steps may be necessary to prevent a war which, all recognize, can, if it once breaks out, only with difficulty be prevented from developing into a great European conflict. The temptation to scold them for their comparative inactivity is so obvious that we cannot be surprised at the lectures, the objurgations, and the appeals to do their duty which are now being showered on them. The problem before the statesmen of Europe is, however, not so simple as it looks. The Concert of Europe, if we may use a phrase which has seldom corresponded to reality, is not a single organization directed by a single mind, or even by a group of men in close and constant touch with one another, sharing the same interests and having complete confidence in one another. It consists of six absolutely independent governments, each possessing special interests of its own, and its own sympathies and point of view. In some cases their interests are widely divergent, and their points of view are very far apart; they have not all adsolute confidence in one another, and the contact between them is neither very close nor very constant. It is no easy matter for them to co-operate effectively for any purpose, especially for any purpose involving immediate and decided action. Nor is the action which they are now being urged to take without risks and difficulties which render hesitation explicable enough. They could, if united, order the Balkan States to abandon their bellicose intentions; but if the order were not accompanied by a definite of the Macedonian question satisfactory to the undertaking to force upon Turkey a solution allies, it would in all probability be followed by revolutions in Bulgaria, Greece and Servia. No solution of the Macedonian question would be regarded as satisfactory that did not involve the disappearance of direct Turkish rule from the greater part of European Turkey. No Power which wishes to remain on good terms with Turkey—and several of the Powers have very good reasons for so wishing—or which, having numerous Mahomedan subjects, wishes to avoid provoking a reaction among them, could, without grave hesitation, take the lead in imposing such a concession upon the Porte. Were the Porte to concede that large degree of autonomy to the Macedonian provinces which alone would satisfy the allies, it would have to face the imminent probability of another revolution in Turkey. The popular passion now rising against the Balkan States would be turned against the Government which made what would be regarded as a humiliating concession to them. The Committee of Union and Progress, which the Ministers in office have overthrown but not crushed, has proclaimed its intention of supporting the Government in defense of Ottoman rights. In the event of such a surrender it would not hesitate to take full advantage of the situation; and the results of the chaos which would ensue might be almost as incalculable as those of the threatened conflict. We pray that the war, with the horrors it cannot fail to produce, may yet be averted; and we dread as much as any one the effects of the strain it may put upon the relations between Russia and Austria-Hungary and their friends; but we appreciate the difficulties of the position in which the Powers find themselves, and we deprecate any hasty criticism of the statesmen who are called upon to tackle a well-nigh insoluble problem."

The Powers chiefly interested are Austria, Russia and Italy. Austria is supported by Germany. She is opposed to any change in the Balkan Peninsula which does not leave the way open for her to come down to Salonica and annex Macedonia to her own empire. She is consequently opposed to any enlargement of Montenegro, Servia, Bulgaria or Greece. So long as Albania and Macedonia remain Turkish she is willing to bide her time. She would be glad to see the country peaceful and better governed by the Turks until her time comes; but she would rather see the whole population massacred than to see the territory divided among the neighboring Christian states. Her chief opponent in this matter is Russia. It is still the great ambition of Russia to secure Constantinople. They are not talking about it since the war with Japan, but the purpose has never been abandoned. Austria is the great obstacle in the way. Russia might allow Austria to come to Salonica if she would consent to allow Russia to take Constantinople, but on no other terms. Meanwhile Russia feels it to be for her interest to favor the extension of the Balkan states, especially the three Slavic States. Italy also is opposed to the farther advance of Austria to the south. She has her own ambitions on the east coast of the Adriatic,

which Austria will never tolerate if she can prevent it.

German ambition seems to be confined to the exploitation and perhaps the annexation of Asiatic Turkey, and it is not many years since an English statesman, then a minister, assured me that England would be glad to see Germany in possession of Asia Minor. If he were alive he might not be of this opinion now. France and England have more important interests at stake in Turkey than any other Powers, altho of late years Germany has gained upon them, and both France and England are now ruling a vast Mohammedan population in Asia and Africa which is supposed to have more or less sympathy with Turkey. Their policy in Turkey is more or less influenced by this fact. France is generally regarded as a special protector of Greece and has friendly relations with Bulgaria. The English and French are generally in sympathy with the Christian population of Macedonia, but the governments, since the Crimean War and the treaty of Paris, have always professed to defend the integrity of the Turkish Empire. They at least have no sympathy with the ambitions of Austria, Russia or Italy. England, under the leadership of Lord Beaconsfield, went wrong at the Congress of Berlin, and since that day has never had a fixt policy at Constantinople. She has a real sympathy with the opprest Christian races and no Power has used stronger language in condemning the conduct of the Turks; but whenever it has come to action she has drawn back, generally because she was unwilling to act alone. Lord Salisbury declared in a public address that the Crimean War was a mistake. He said, "We bet our money on the wrong horse," but at Berlin he made the same mistake. The treaty of St. Stephano, which he helped to destroy, was far more favorable to the interests of England than the treaty of Berlin, which he helped to make. It is a curious fact that the treaty of St. Stephano was drawn on the lines of the decisions of the conference at Constantinople, which Lord Salisbury dominated, and the rejection of which by the Turks led to the Russo-Turkish war. If England had accepted that treaty we should have been spared the Armenian massacres of 1894-96 and the troubles in Macedonia which have led to the present war. It remains to be seen what her policy will be in the Balkan struggle. The Grand Vizier in Constantinople declared the other day that England was the chief friend and defender of the Turkish Empire. The truth is that Turkey has no protectors. Every Power would be glad to see the last of the Turkish rule in Europe. It is only a question of who shall have the spoils of the Empire. As England and France do not covet any of these, they are in a limited sense her best friends.

Something is said in the newspapers of the probable intervention of Rumania, the small kingdom on the lower Danube. It is rumored that she has a treaty of alliance with Turkey and may attack Bulgaria in the rear. Rumania is a flourishing little state, more or less allied with the Triple Alliance. But her next neighbor to the east is Russia, and it is most improbable that she will be allowed to attack Russia's principal friend in the Balkans.

If Europe does not intervene and the war is prolonged, the chances are favorable to the Turks. The genuine Turk, of whom there are some five millions in the Empire, is first, last and always a soldier. He has proved his prowess upon a thousand battlefields ever since the time of Ghenghis Khan. The Ottoman Turks, always a small minority, have ruled the Empire and defied Europe for six hundred years. The only foreign soldier of whom the Turk is afraid is the Montenegrin. These mountaineers have never been conquered. A Turkish soldier once said to me, "I am not afraid of men, but these Montenegrins are devils." The Turkish army has been greatly improved of late years under the direction of the distinguished German officers loaned to Turkey by the Emperor. Special attention has been given to the training of the officers—and they have some experienced and distinguished generals. The Bulgarian army in training and discipline is one of the best in Europe, but it has had no experience in actual war and the Turks will probably concentrate their forces against Bulgaria, simply taking the defensive against the other states. The Bulgarians

will fight to the death, but the Turks will have the advantage in numbers and material of war.

The Greek army is full of patriotic enthusiasm, but it disgraced itself in the last war with Turkey and is undisciplined. The great advantage of the Greeks is in their navy, and if the Turks dare to venture outside of the Dardanelles they will probably be defeated—but such a defeat would not determine the fate of the army.

The Servians, like the Montenegrins, have been fighting the Turks for centuries, often with success, but the Servian army is not supposed to be very well disciplined or very reliable. It has suffered from the general corruption of the government.

In general the Balkan alliance is weakened by the fact that each state is fighting for itself, independently. There is no central control to direct the campaign as a whole, while the Turks have a commander-in-chief who can co-ordinate the movement of the armies and adapt it to any exigencies which may arise. If they can crush the Bulgarians they will be free to deal with the other states at their leisure.

Boston, Mass.

A May-Day Journey to Stratford

BY JAMES A. B. SCHERER

President of Throop Polytechnic Institute.

EVERY good American ought to go to Stratford before he dies—and to Paris afterward, if he must. Only the best Americans deserve the luck that befell McClintock and me on our first visit to the shrine. On a Sunday in May we entered Stratford—and what a wonderful May day it was! The train would carry us no farther than to Honeybourne, as English railways half revere the Sabbath day. The name was fragrant with delight to our keen nostrils—this gateway to the bourne where lies "Sweet Will." The tonic of the air made the intervening ten miles seem as naught to youngsters such as we became that morning, when we stoutly faced the verdant hills of Warwickshire. It was only our second day in England, the first having slipped away at Oxford, and every prospect pleased us with a new delight. England, as all know, is an exquisite garden, cultured to the acme of perfection, without loss of its natural charm. There is never a brown house by the roadside but it fits into the scene as tho it had grown there; and the first one we approached not only lured us with its quaintness, but bade us be at home with swinging outstretched sign. It is what they call "a public," and the chief charm of a public is its privacy. Seated there in rare good fellowship with McClintock, in that social frankness and that delightful mental abandon that comes all too seldom to men beyond the age of thirty, I thought of Irving in his solitary comfort at the Red Horse Inn of neighboring Stratford, and his soliloquy upon His Majesty the Traveler: "The armchair is his throne, the poker his scepter, and the little parlor of some twelve feet square his undisputed empire."

We had come into our own. Taught from childhood that every man's a king, we never realized our royalty until we sat armchaired in the English inn-parlor of Mr. John Eva, near the nestling green village of Shakespeare's Honeybourne.

But with the thought and the mention of Washington Irving both of us leaped to our feet, eager that no time should be lost before we, too, should sit by the "soft-flowing Avon," and tread the haunted ground where Shakespeare walked.

As we were setting forth once more on our tramp, the hospitable Eva interposed. 'E 'ad a trap that we might use, for a consideration. Quite as much for his name and his haccent as for his trap's sake we bargained with Mr. John Eva, and soon went bowling away toward

Stratford, in the very highest trap I ever saw. McClintock perched behind like a monkey; while I, from my throne beside the Cornish driver, looked down an indefinite distance on the back of the sleek little cob.

We had no sooner mounted the rounded hill beyond the railway than the glory of Shakespeare's England burst upon us, in flowers and bird song together. Great golden lamps of laburnum flamed in every green field, and strewn about were myriad sparks of yellow gorse. The May arose from either hedge-row, fragrant and white as a bride. I could almost swear that I heard Perdita's merry voice exclaiming, silver sweet:

> —Here's flowers for you!
> Hot lavender, mints, savory, marjoram;
> The marigold, that goes to bed with the sun,
> And with him rises weeping;
> Daffodils,
> That come before the swallow dares, and take
> The winds of March with beauty; violets dim,
> But sweeter than the lids of Juno's eyes
> Or Cytherea's breath; pale primroses.
> That die unmarried ere they can behold
> Bright Phœbus in his strength,—
> bold oxlips, and
> The crown-imperial; lilies of all kinds!

I cannot say that all these flowers were there; I can only vow that I seemed to see them all, and that I surely heard the voice of the "queen of curds and cream" as she made her way thru the May fields with Florizel, both in their best Sunday clothes.

And the birds! I jumped nearly out of Mr. John Eva's trap, so that the pony shied abominably, at the first song of Browning's wise thrush—

> That's the wise thrush; he sings each song twice over.
> Lest you should think he never could recapture
> The first fine careless rapture!

We recognized him on the golden instant, and felt as if he must know all about Browning, and were greeting us to England with a very sweet and secret word of welcome, which he and we had learned from the poet's soul. And there soars Shelley's lark, which Shakespeare had heard long before him, singing at heaven's gate. "The birds chant melody on every bush," a very tuneful and multitudinous choir, as we bowl thru the fields of Shakespeare. I never dreamed that England would be half so beautiful, or that birds could sing in Paradise more sweetly than one hears them in every roadside English copse "in the merry month of May."

There is a good bit of sentiment in the average American bosom, and neither McClintock nor I should feel ashamed of what happened when we actually rode down into Stratford. We had passed thru "Piping Pebworth," where I thought of the "Farrier Lass" of Amélie Rives, and where John Eva religiously told us the old yarn of Shakespeare's drinking-bout, which I do not like to believe; the laburnum had vied with the sun in lighting us on our pilgrimage, all the way, and the vocal honey of the birds had almost teased us with unbroken liquid delight, when suddenly, as we ascended a green oval hill, the spire of Shakespeare's church shot upward toward the throne of God, and the Avon glinted here and there among the trees like broken silver. "This were enow;" we held our breath for the beautiful pain of it; but on that breathless instant, as tho England were outdoing herself in honor of Shakespeare and spring, the air crashed with the ringing tongues of Shakespeare's chime of bells, and it was as if we verily heard that mighty voice of myriad universal tones. Yes, I shivered; I am not ashamed of it; and as I looked backward at old McClintock, that bronzed chief of the Sioux Indians was swallowing hard, I tell you! It was exactly eleven o'clock; we had come upon our shrine at worship time.

I remind myself of a comfortable word out of Hazlitt: "An overstrained enthusiasm is more pardonable with respect to Shakespeare than the want of it; for our admiration cannot easily surpass his genius."

On my second day in Stratford the highly intelligent spinster whom we had been fortunate to meet at the hotel was quizzing me, as we stood at Anne Hathaway's gate, as to whether Americans truly appreciate Shakespeare. (The story is embellished in the telling, but its essentials are true.) We had just come from his tomb in the beautiful church, where there is a distinct American chapel, furnished thruout by my countrymen, and where the verger further volunteered the information that the great window just behind the reredos

had been given recently by an English nobleman for the express purpose of preventing the main window in the sanctuary from becoming an American donation. We had also seen the great American fountain in the square, and Mr. Carnegie's gift near the Birth House, so that Milady, flushed with perhaps pardonable jealousy of the Yankee monopoly of Stratford, proceeded to intimate to me that our appreciation contains rather more of swagger than sincerity.

"Ah yes!" she said, very sweetly, "we quite understand the immense power of American wealth, and its tendency—you will pardon me?—to advertise itself, as it were, by the purchase of Shakespeare memorials here in Stratford; but can you really assure me that your countrymen appreciate the immortal poet as much in their homes as they *seem* to do when they come over to England?"

This was just a little more than I could peacefully receive, even from her Highly Acidulous Spinstership, so I said to her, very solemnly:

"Yes, madame, I do assure you. Why, we name even the fowls of the air with pet Shakespearean nomenclature over in the land of the prairies. For example, my favorite hen of all my prairie chickens is named Macduff."

"Most extraordinary!" exclaimed my new-found friend, in the inimitable British manner of saying those two words; "most extraordinary!" she repeated—"and may I awsk you why?"

"Because I want her to lay on," I answered her, of course. But—would you believe it? Her expression grew grave and perplexed; she shook her head very thoughtfully; then finally replied:

"Ah, yes, that is all very well; but—you will pardon me?—it seems to me most extraordinary, trained as an Englishwoman in the niceties of our language and of its grammar, don't you know, that you should bestow a masculine name upon a hen?"

When I had sufficiently recovered consciousness I remembered that when Eugene Field visited England, Mrs Humphry Ward gravely inquired of him where he had been when "discovered"; and that, upon Field's reply, with equal gravity, that he had been "up a tree," Mrs. Ward promptly asked him, "What kind of a tree?" And I feel, so far as British humor is concerned, that I am just where Field was.

PASADENA, CAL.

Out of Doors

BY MARTHA R. McCABE

OH, it's ho! for the fields today!
For the sweet, wide, out-of-doors!
For the air, like wine,
For the crisp sunshine,
And the asters along the way.

And it's ho! for the quiet wood!
For the flame on bush and tree!
For the stream, leaf strewn,
For the rifle's tune,
And the quail with her scuttling brood.

Oh, it's ho! for the everywhere
That's out under Heaven's blue;
For meadow and stream,
And hillsides a-gleam,
And the autumn that's in the air.

EMPORIA, KAN.

Competition Versus Monopoly the Issue of the Campaign

BY BENJAMIN M. ANDERSON, JR.

Instructor in Economics in Columbia University.

ONE vital issue between Governor Wilson and ex-President Roosevelt in the present campaign is the question of the relative merits of competition and monopoly in the field of manufactures and mining. Neither of them, probably, would question the contention that competition is, and should be, the rule in agriculture; neither would question the proposition that competition cannot be trusted to regulate railroad rates, and that regulated monopoly is preferable to competition in such enterprises as water and light, telephone, local transportation, etc. The question hinges on the possibility and desirability of competition in that great field now so largely occupied by our industrial trusts: manufactures, oil, steel, anthracite, etc. Mr. Roosevelt maintains that competition is impossible and undesirable, in the main, in these fields; that we should accept the fact of monopoly and make the best of it, by regulating the great combinations in such a way as to eliminate their power to oppress the public and labor, and to gain for the public the advantages that come from their efficiency. Mr. Wilson maintains that competition in these fields is possible and desirable; that we should, however, so raise the level of competition as to eliminate the unfair practices which have enabled large firms to crush out rising rivals; that if we make the field fair, men will win only thru efficiency, and that the public will gain thru immediately lower prices, and thru that continuous progress which the spur of competition assures.

The writer waives a discussion of the question as to the possibility of destroying the great monopolies. It is true that much is written about "inevitable economic tendencies," and the helplessness of law to prevent them. But for the purposes of this discussion it will be assumed that we can destroy the trusts if we are determined to do it. The question here raised is as to the desirability of so doing. And from the standpoint of economics, the central question involved on that point is as to the significance of the alleged "economics of combination." Other non-economic questions remain after that is settled. It might be maintained that, even if the trusts should be somewhat more efficient than competitive business, they are dangerous in a political democracy—a view for which much might be said, but the discussion of which lies outside the scope of this paper. The writer, conceding for the sake of the argument the possibility that under proper regulation the iniquities of monopoly from the standpoints of political corruption and the unfair distribution of wealth might be checked, wishes to center attention upon the question of the efficiency of the trusts as producers of wealth. Are the claims made for the "economies of combination" substantial or illusory?

A distinction must first be made between the social viewpoint and the business viewpoint, in the evaluation of these alleged economies. The two viewpoints are not entirely opposed, but the analysis which follows will show many points in which they are. Combination may enable the business concerned to make larger profits, but it may do so simply by enabling it to draw to itself income which would under competition have gone to other elements of society. The question will be considered primarily from the social viewpoint. Conceding, provisionally, the claims of the trust promotor's prospectus as to the business gains to come from combination to those in the combination, let us see how far these gains are really social gains.

The terms "economies of combination" and "wastes of competition" are usually correlative terms as used in cur-

rent discussions. It must be noted that the economies of combination are in no sense the same as the economies of large scale production. The question at issue is not whether we shall have business done in small shops or in big shops, but rather, whether we shall have the big enterprises run in competition with each other, or shall have them under one financial control. Thus, in the packing business, Swift in Chicago has an enormous plant, in which every by-product of the animals slaughtered is utilized to the utmost. Armour has a similar plant in Chicago. There are like plants in Kansas City, in Omaha, and other centers. The number of great packing plants in the country is really quite large. Now the question at issue between Governor Wilson and Mr. Roosevelt is not as to whether these plants shall be allowed to remain big; it is simply as to whether it is necessary or desirable to allow them all to be under the same financial control. We must, therefore, rule out from the "economies of combination" which are at issue all those economies which come simply from having large scale production. Unless it can be shown that large scale production does not reach its full efficiency till all the business in each line is done in a single plant, it is clear that the gains from large scale production do not justify monopolistic combination.

What are the specific gains that are supposed to come from combination as such, from the elimination of the "wastes of competition"? They have been set forth in numerous trust prospectuses and numerous books. A list of the claims of the trust promotor follows:

1. Power over prices: power to raise prices and to keep them steady.

2. Power over labor: power to control unionism and to prevent strikes.

3. Power over jobbers and other middle men: power to compel them to pay promptly: power to refuse to allow their claims for shortages and damaged goods, etc.

4. Power over the producer of raw material (often stated simply as the ability to buy more cheaply because buying in larger quantities).

I presume that little question will be raised but that virtually all these advantages of combination are socially disadvantages, however much they may contribute to the profits of the combine, and it may be assumed that Mr. Roosevelt's plan of regulation will seek—whether successfully or not I shall not here consider—to curb the power of our combinations at these points. It may be noted, however, that the monopoly's power to keep prices steady is, in itself, a good thing in part, even tho it be one which we cannot afford to have at the price of monopoly, in the author's opinion. Concession must be made, too, to the principle that there is economy in wholesale buying (item 4 in the list) in so far as it comes from eliminating unnecessary handling of the goods. Of course, as in the case of the tobacco industry, the cheaper raw material has come thru the power of the combine to oppress the tobacco growers, and is wholly indefensible. The writer does not believe that the advantage of wholesale buying is one that can continue indefinitely. It is one which makes large scale production in so far more advantageous than small scale production, but there is no evidence whatever that it is added to much by the financial combination of many big plants.

To resume the list:

5. The big firm can utilize by-products, which are wasted by the small producer.

But this is merely an argument for large scale production. It would be quite impossible to show, in the packing business, *e. g.*, that Armour and Swift cannot utilize by-products about as effectively when competing with each other as they can in financial combination with each other. This is accomplished by technical methods, and depends on the size of the individual plant, rather than on the financial control.

6. There is a gain from the integration of different stages in the same line, as, for example, in the case cited by President Van Hise ("Concentration and Control," p. 10), where by combining different stages in the manufacture of steel you are able to put the metal thru several processes without allowing it to get cold, whereas if the different processes were performed in different plants it would have to be reheated each time.

But, pretty obviously, this is again merely an argument for technical big-

ness of a single organization in a single locality. It means nothing as an argument for combining different plants in different localities. It is, further, in no sense an argument for the combination of *competing* producers in the *same* stage of production.

7. Where you have several competing firms, each will have a few patents covering certain parts of the process of manufacture, while the others will have patents covering other parts of the process. None will be able to use the best methods at all stages of production, because of the monopoly by others on patented processes. If they combine, however, then all plants can use all of the patents.

This is really a very curious argument. It says, in effect: "Monopoly in patents is a bad thing; let us remedy it by getting a monopoly of the whole business!" The logical conclusion of the argument would be the throwing open of all patents to all producers. It is an argument against the original theory of the patent itself. A patent is useful to its owner only in so far as it gives him a *differential advantage* over rivals who are trying to perform similar services. It presupposes the possibility of competition. If all the producers in a given line are in combination, then the idea, unpatented, would be just as useful as if it were patented. The idea in the patent is, of course, to stimulate invention by giving the inventor a chance at profits from which others are excluded, as compensation to him for his risk and trouble as inventor. It is interesting to note, in this connection, that the inventors are themselves complaining that the great monopolies have made it difficult for them to make profits out of their patents. The inventor has a much better chance when a number of rivals bid against each other for the use of his invention. Further, the inventors complain, many of their patents are shelved by the big monopolies, whereas firms under the spur of competition would be compelled to put them to immediate use. Conceding, however, the desirability of having all the producers in a given line make use of all the patents, it by no means follows that combination among them is necessary. The plan of throwing all patents open to all who care to use them upon the payment of a royalty (the same rate to all) to the inventor, would accomplish the end in view equally well, and would leave the spur of competition as a means of forcing into immediate use all really useful inventions. It would, further, assure the inventor of a real reward when his patent is put into use.

8. Competing firms have large advertising expenses, which are counted as part of cost of production, and raise the prices of goods. A monopoly can dispense with much of this advertising. Tremendous figures, in dollars and cents, are given in connection with this argument, and the implication of a tremendous social waste is seemingly taken for granted. This phase of the matter is especially stressed by President Van Hise on p. 89 of his "Concentration and Control."

It is doubtless true that monopolies need to advertise less than competitive firms do, and so can save a considerable part of the expense of production. But it by no means follows that society at large is saved the sums that this surface fact seems to indicate,—even assuming that regulation of monopoly could give the consumer correspondingly cheaper prices. What competition takes with one hand, it restores with the other. The consumer pays more for advertised goods; well and good. But he also pays vastly less for newspapers, periodicals, etc. Competition among publishers in expanding their circulations so as to get advertising, has compelled them so to reduce the subscription rates to their papers and periodicals that the purchaser often gets them for less than the cost of the paper on which they are printed. The social cost of advertising is simply the labor of typesetters, the labor of advertising writers, the paper and ink used in printing advertisements, etc.—a vastly smaller cost than the amounts paid for advertising would indicate. And the educational gain that comes from such a wealth of cheap reading matter—making all concessions that any one demands as to the cheap *quality* of much of the reading matter!—is simply incalculable. Besides, the advertising itself is not by any means social loss. It, too, has educational value. It stimulates *wants*—and wants are the steam that keeps social progress going. It is as much in the

multiplicity and insistence of his wants as in anything else that civilized man is superior to the savage.

9. Combination enables a business to discharge numerous traveling salesmen, and impressive figures have been offered to show how much is thereby saved.

That the business does save thereby is, for argument's sake, admitted, and that there is some social saving, after the discharged salesmen get to work at something else, is also admitted. But it is denied that the saving is *net,* by any means. For the traveling salesman is a dynamic social agent. He spreads ideas; he keeps the trade up to standards; he aids in making the country socially homogeneous; he breaks up provincialism and traditional methods of doing business. The writer has in mind many specific instances where young business men in small communities have been tremendously aided by advice from experienced traveling salesmen, and cases where young men about to embark in business have, on the advice of experienced elders, spent a few months "on the road" as a means of learning business methods in the line they wished to undertake from men engaged in that business in many communities.

It is not denied that there would be some social saving from the elimination of salesmen. The considerations raised on the other side are incapable of precise quantitative measurement, and the writer cannot say what they are worth in dollars and cents. But that they are substantial, and that their existence makes necessary a substantial discount in the "economies of combination" at this point, he is convinced.

10. Combinations find it unnecessary to offer premiums, and so save an item of expense often incurred by competitive businesses.

But, socially considered, the premium is no loss. To be effective as a premium, the thing offered must be something that the people want. Whether they patronize firms which offer premiums, and charge a little more on the main line to make up for the fact, or whether they patronize firms that offer no premiums, in either case they pay for what they want. And it will hardly be contended that it is a proper purpose of monopolistic combinations to keep the people from spending their money foolishly, even if it should be contended that the premiums are often things that the people could well do without. Moreover, not all combinations have refrained from offering premiums.

11. Combinations can save cross-freights, which under a competitive system are likely to occur. Instead of a Chicago firm shipping goods to New York at the same time that a New York firm in the same line is shipping the same goods to Chicago, under combination the New York branch of the combine would supply all the New York trade, and the Chicago branch all the Chicago trade, and large freight bills would be eliminated.

Now it is difficult to determine the extent to which such cross shipments have taken place under the competitive system. The presumption is, of course, that if the New York firm really has goods just as good and cheap as the Chicago firm, it could, with the freight item in its favor, undersell the Chicago firm in the local market, and prevent much of that sort of thing. But the argument that follows applies whether the amount of cross-freight is large or small: the saving on this point may be big in dollars and cents to the members of the combination; socially considered, it is subject to a big discount. Because the railroad business is a business subject to the law of "diminishing costs." Given the expensive roadbed, given the terminals, given the train crews and rolling stock, given the office organization, there is a huge expense, a fixt expense, whether the transportation business done is large or small. A train may run full almost as cheaply as empty. A track may be used twenty times a day almost as cheaply as once a day. Extra business does increase the expenses, the *variable* expenses, but it does not increase that tremendous item in the railroad's bookkeeping, the *fixt* expenses. If the traffic is large, the railroad may spread these fixt expenses over many items, and so make moderate rates to all; if the business is lessened, the fixt expenses must be met by a smaller number of items, and the rates on all freight correspondingly increased. Assuming that governmental regulation of rates keeps rates down to a reasonable return on the railroad's in-

vestment, then increasing traffic means lower general rates. It is, therefore, not true that the social saving from the elimination of cross-freights is anything like as great as the saving in dollars and cents to the members of the combine, even assuming that regulation of their prices by the government commission made them give the saving to the people. The net saving is only the *variable* expenses of the transportation concerned.

12. Combination enlarges the field of operations for men of great ability, and prevents their wasting their energies as managers of single plants where the full use of their powers is impossible.

This is an argument doubtless very pleasing to the vanity of "captains of industry." But it is very questionable indeed if it be more than an argument for large scale industry. There may be men whose abilities are so great that only monopoly can fully utilize them, and there are doubtless many men whose ambitions are so great that nothing short of monopoly can satisfy them. Theory cannot answer the question. An appeal to the facts of American industrial history might. But from the angle of theory it might be suggested that men will be more apt to use their ability to the utmost if spurred thereto by the competition of men of similar ability in independent enterprises. The writer has no first-hand data which would justify him in answering the question he proposes, but he raises the question if the men who were with Mr. Carnegie before the organization of the Steel Trust and who have since taken important positions with the Steel Trust have manifested greater productive efficiency in the bigger company than they did in the former?

13. The combination need make no extensions of credit, and so gets along with less capital than the separate firms require, thus saving interest.

True, but, on the other hand, the jobbers and retailers must then use *more* capital, paying interest for it at higher rates than the manufacturer pays, so that an even larger interest charge enters into the price that the consumer pays, and there is no social saving of capital.

In general conclusion on this point it may be said that many of the gains to the combination are clearly socially disadvantageous, representing merely subtractions from the incomes of other elements of society in exact proportion to the monopoly's gain; that many others, in so far as legitimate, come not from combination as such, but merely from large scale production in the single plant; that of those gains which come directly from combination, thru the elimination of "competitive wastes," virtually all are subject to great discount before they can be reckoned as social gains, and many are socially illusory.

Further, as against these and all similar arguments, are to be put the familiar doctrines of the classical economics as to the stimulating effect of competition, the great dynamic agent, which both in the biological and in the social-economic world has been the mainspring of evolution, and the fact that, other things equal, size is a handicap, leading to unwieldiness and red tape. "Cut-throat competition" has been much complained of, and it is held that cut-throat and unfair competition are inevitable unless you stop competition entirely. But competition means different things in different ages. Primitive man competes with a club. Since his day, society has been continually raising the moral and legal "level of competition," so that it is a vastly different thing. Physicians compete—but not as Standard Oil competes! It is the business of organized society to lay down the rules of right and wrong in competition, and hold competitors to them. Further, cut-throat competition occurs when competitors aim at monopoly. If competitors were sure that society would not tolerate monopoly if they should secure it, the main incentive to ruinous competition would be gone.

In the argument that has preceded, I have provisionally conceded that the claims of the trust promotor as to the business gains of combination are valid. But this concession need not be made. It is certainly undemonstrated that any combination has been successful because of these economies alone. The successful trusts have been successful primarily thru monopoly which they have secured by means other than the economies of combination, and there are numerous wrecks in the history of trusts in cases where thru failure to get monopoly the big combine found itself unable to hold

its own with less clumsy competitors. Professor E. S. Meade, of the University of Pennsylvania, easily one of the best informed men in the country as to the business aspects of corporations, maintains vigorously, in the April, 1912, number of the *Journal of Political Economy,* that, from the angle of business profits itself, the trusts have not made good, and similar views have come from other quarters.

Our conclusion is, then, distinctly adverse to Mr. Roosevelt's policy. Conceding for the sake of argument that the trusts can be so regulated as to take away their power of oppression, of consumer, of laborer, and of producer of raw material, conceding that their political power can be destroyed and that they can be made no longer a menace to democracy, conceding that the claims made for them from the standpoint of business profits are valid, it still remains true that the social benefits supposed to flow from them are largely illusory, and much more than offset, in the writer's view, by the loss of the industrial progress which competition assures. And it need not be added that the concessions listed, made for the purpose of narrowing the scope of the argument, are wholly unproved assumptions, the probability of which is so doubtful that to rely on them as a basis of practical action would be a wild leap in the dark.

New York City.

The Gray Sisters

BY MADISON CAWEIN

What is that which walks by night
In flying tatters of leaves and weeds,
When the clouds rush by like demon steeds,
And the moon is a jack-o'-lantern light
Low in the pool's dark reeds?—
What is that, like a soul who sinned?—
Is it a witch? or the Autumn wind?

What is that which sits and glowers
Under the trees by the forest pool?
With a cloak of moss whence the raindrops drool,
Chilling the air with a sense of showers
And touch of the cold toadstool:
What is that, with its breath of gloom?—
Is it a witch? or the Fall perfume?

What is that in a mantle of gray,
With rags like water that wreathe and wind?
That gropes the forest, as if to find
A path long lost, on its midnight way,
Shadowy, old and blind:
What is that, so white and whist?—
Is it a witch? or the Autumn mist?

You may have met them; you may have heard;
As I heard them; as I have met;
The three gray sisters of wind and wet,
Each with a spell, or a cryptic word,
Working her magic yet.
The three gray sisters, the witches old,
Daughters of Autumn, who haunt the wold.

Louisville, Kentucky.

What Shall We Do With the Constitution?

BY GEORGE SUTHERLAND

United States Senator from Utah.

IN the minds of some people the provisions of the Constitution are of the same casual nature and as lightly regarded as the resolutions they make with the New Year season of repentance; but to the thoughtful student of law and government the great principles of the Constitution, as old as the struggle for human liberty, are as nearly eternal as anything in this mutable world can be. We cannot outgrow them any more than we can outgrow the Ten Commandments or the enduring morality of the Sermon on the Mount.

The Constitution did not create the Union, but by perfecting it made it enduring—preserved it from destruction. If the present-day teachers of vague and visionary reform would know the fate which will overtake the Republic if the Constitution shall lose its binding force they have but to read the history of our country under the Articles of Confederation and see it repeated and intensified in the proportion that our population has increased, our territory extended, and our problems become more numerous and intricate. The patriotic, intelligent, justice-loving people of our land after all constitute but the body of the Union. Its soul is the Constitution.

But it is becoming unfashionable to speak well of the Constitution. There is abroad in the land a new political propaganda whose teachings suggest that the written Constitution is binding only upon the minority and that its meaning may be ascertained more accurately by inspecting the casual contents of the ballot box than by invoking the trained and deliberate judgment of the Bench. The lessons of history are being consigned to the limbo of ancient and discredited superstitions. The past is useful only in teaching us what to avoid. Doctrines and laws are right only in proportion as they are novel. The desirability of the thing proposed is measured only by its difference from things that are. Experiment is more highly regarded than demonstration. Prediction is exalted above experience. To advocate old, well-proven methods is to be suspected of nefariously working a confidence game upon a virtuous and progressive population. We are told that the Constitution stands in the way of reforms which are demanded by the people; that it has become a dead wall in the path of progress, to be assaulted and overthrown before we can move on.

Fortunately there are many, still, who do not accept this view; who believe that the principles of the Constitution are living forces, as vital now as when they were adopted; that it is not a wall but a wide, free-flowing stream within whose ample banks every needed reform may be launched and carried; who believe that the newly developed tendency in the direction of breaking down the organic consciousness of the people is the overshadowing and sinister menace to the American social structure today.

If this tendency shall go forward, increasingly, disaster must inevitably result, for an aggregation of individuals can no more escape the consequences which follow a violated law of their being than can a single individual. In both cases the penalty for excising the vital organs is death and dissolution. In the political body the vital organs are the legislative, the executive and the judicial departments. The functions of government committed to these organic institutions can no more be carried on by society, *en masse*, than the functions of the human body can be discharged without its organs.

The framers of the Constitution were deeply learned in the science and history of government. They knew the dangers to be guarded against if government by the people was to be just and enduring. They knew that pure democracy was a

beautiful but barren and deceptive ideality which had never survived and in the nature of things could never survive the test of practical experience, since it constitutes an attempt to carry on the complex functions of social organism without the necessary and appropriate organs. They realized that for even the three million people of their day to undertake by direct action the making of laws, the interpreting of laws, the executing of laws would only be substituting for the orderly, despotic rule of the king the spasmodic and often no less despotic rule of the fluctuating majority.

The voice of the people may be the voice of God, but neither God nor the people at all times speaks thru the excited will of the majority. The problem which faced the framers of the Constitution was to devise a means of securing the sober and deliberate will of the people; not the mechanical and helpless register of the passing whims and caprices and fleeting emotions of the constantly changing numerical majority. So they established a representative republic—a self-limited democracy. They provided for three separate departments, conferring upon each its distinctive powers, denying to each any authority to invade the domain of the others.

So delicate and yet so strong was the adjustment that the average citizen, except in periods of stress, has been scarcely aware of the existence of these governmental agencies. Until recently it has never occurred to him that direct participation on his part in the framing of laws, the recall of judges, the revision of judicial decisions was a fundamental or valuable right of which he was being unjustly deprived. He has lived in peace, secure in his possessions, only subject to such restraints as would enable others to do the same. But all at once the call has gone forth for the people to take possession of the machinery of government and by their direct action perform the difficult and complicated functions of making, construing, and executing laws.

We may not question the good faith of the people themselves in seeking these radical changes, but we may doubt their wisdom in having lent too ready ear to the professional demagog whose strident voice has filled the land with his ill-considered, impractical theories. If the vast majority of mankind had not earnestly desired that their dealings with one another should be characterized by the principles of justice, organized society would never have emerged from savagery, much less have gone steadily onward to higher and higher levels of development, advancing quite as much by the sturdy retention of the old truths as by the discovery and application of new ones.

We learn to distinguish what is wise and right from what is wrong and foolish by experience which compels our assent rather than by precept which only advises our understanding; molding by evolutionary rather than by revolutionary methods the fundamental principles of law and government into appropriate form. But the last decade of our history has witnessed the advent of certain amiable but restless gentlemen who have employed their talents in an effort to persuade themselves that the Constitution stands in the way of social and moral advancement. They have made slight inquiry as to their probable destination, but they are anxious to be on the way and are impatient at obstacles which they fancy the discredited document presents to an immediate start. They do not seem to realize that while progress involves change, change does not always mean progress.

There stands in Paris a stately and imposing structure called the Arch of Triumph. There are two methods by which the descent from the summit may be made, namely, going laboriously down the stairway or utilizing the force of gravitation by jumping from the parapet. A few years ago several gentlemen were standing on the top of that famous monument. All but one of them being commonplace people descended in the old-fashioned, orthodox way. That one, a gentleman of advanced views who had charmed the others by the brilliancy of his conversation and the boldness and originality of his speculations, took the other route, with the result that the following afternoon he was buried in the cemetery attached to the lunatic asylum from which he had escaped. The lesson of the incident I commend to the thoughtful consideration of the impatient reformers of these days. The constitu-

tional stairway may be slow and tiresome, but it at least assures safe arrival.

The chief value of the written constitution is that it operates to prevent ill-considered and impulsive action. It rarely presents an obstruction to real progress, and in that rare instance it will be far better to reach the desired result by the slow process of amendment rather than by the drastic and dangerous expedient of constitutional violation. It is urged that the Constitution was made for a past generation, whose problems were wholly different from those which we are called upon to solve; that its provisions stand in the way of a solution of the present day problems in accordance with enlightened modern sentiment; that the will of the people is progressive but judicial interpretation is reactionary. Utopian plans of reform are conceived which, because they cannot be put into instant operation, engender a spirit of almost intolerant impatience, and the search for a short cut to the desired end is strenuous and persistent. It is proposed to make judges more responsive to the popular opinion by hanging above their heads the threat of the recall. Mr. Roosevelt has suggested as another expedient the recall of judicial decisions, and other contrivances are from time to time advocated whereby the popular opinion as to the meaning of the Constitution may be enforced upon the courts, both State and Federal. Quite recently a Senator somewhat petulantly demanded to know *why* judges should not be responsive to the wishes of their constituents.

This demand that courts shall abdicate the duty of determining what is the existing rule of law and automatically accept the impressions of the multitude proceeds upon a complete misconception of the judicial office. Perhaps a sufficient reason why a judge should not follow the wishes of his constituents is that he has no constituents. The judge is not the recording agent of a constituency. He is an authoritative umpire between two contending parties. He administers not the edicts of a portion of the people, but the laws and statutes of all. It is incumbent upon him to enforce the rights of the few against the many. He is not concerned with anybody's wishes. He must regard the rights of one man as more sacred than the desires of all the world beside. The law and the evidence constitute the only compelling voice to which he must listen. The scales of Justice and not the ballot box is the insignia of his office.

The Constitution can be *amended* against the wishes of the minority, by the concurrence of three-fourths of all the States, but it cannot be—and it ought not to be—*construed* by a majority of the people, however preponderating, so as to bind the minority, however small. Such binding construction is the question arising in justiciable form for the court, the duly established official arbiter for that purpose. In that fact lies the safety of every State and of every individual. To suggest that the court must construe the Constitution in accordance with the popular will, or that judicial decisions should be subject to be overruled by popular opinion, however exprest, is simply to advocate a method by which the *rights* of the minority shall be subordinate to the *will* of those who for the time being predominate in numbers.

Abuse of sovereign power is an ever-present danger under any form of government. If the sovereign power be vested in a king every one realizes the vital necessity of guarding against its abuse. *The sovereign power, with us, is the people themselves.* The people as a whole desire to do no wrong, but the will of the people as exprest thru the decrees of constantly changing majorities may be unwise and sometimes unjust; and that this danger may be minimized without preventing the effective operation of the deliberate will of the people, certain fundamental principles were formally enumerated which the people agreed in advance should be beyond their own power to alter except in a way specifically nominated in the compact which they made. There is no other way by which, in a democracy, the weak can be safeguarded against the abuse of the sovereign power by the strong, or the few protected against the aggressions of the many.

If these cardinal principles were not first of all fixed and determined and thereafter faithfully adhered to; if in the last analysis the most despised and unpopular individual might not have his case determined by the independent

judgment of the court, uninfluenced by any consideration other than the learning and the conscience of the judge, standing with naked soul before God, this government, whatever it might be called, would not be an immutable government of law, but a fickle and inconstant government of the changing wishes of men.

So long as human judgment is fallible judges will be fallible. Judges have erred in the past and will err in the future. But to overturn their decisions by a vote of a majority at the polls would be to put the most ignorant voter, in a purely intellectual problem, on a par with the wisest and the best informed, since at the ballot box men are counted, not measured. There can be no greater delusion than to suppose that by putting a ballot into the hands of a voter you thereby put wisdom into his head, or that an aggregation of individuals can reach accurate conclusions by intellectual processes differing essentially from those employed by the single individual.

There is no doubt as to the right or the capacity of the people to govern themselves. In the United States they have always done so and they do so now. The question is not at all whether the people shall govern, but by what method they can govern best—by direct action or by the governmental agencies which they have created. All history demonstrates that where the power to make laws, to interpret and to execute them is vested in the same individual or body, despotism invariably results. The great purpose of the Constitution is to avoid this danger, to preserve the rights of the citizen by the definite and unchanging law of the land, instead of leaving him at the mercy of the transitory opinions of a constantly changing majority. The judges who preside over our courts are men who have devoted their lives to the study of the Constitution and the laws of the land in order to interpret them justly. We should pause long and think well before we conclude that their decisions, based upon ripe and exact learning, can be safely overruled at the ballot box.

"Progress" is an elusive term and very much abused. To publicly label a thing "progressive" is of itself suggestive of doubt, for progress should be self-evident. Progress consists in securing better products—not in smashing old producing appliances and setting up inefficient substitutes. To destroy the governmental methods of modern civilization in order to revive the primitive methods of the tribe is not progress. It is reaction.

I have never been able to convince myself that ability to mark a ballot is evidence of ability to make laws, or that because an individual possesses the necessary skill to insert a ballot in the aperture at the top of a box it follows that he is wise enough to interpret constitutions in their application to the diverse and intricate cases which from time to time arise among our people. It is not progress to place this direct power in his hands. Society advances not by trying to do everything itself, but by utilizing the services of those best capable and qualified to serve it, and by replacing with better men those who serve it ill. We do not employ every man coming down the street if we have work requiring the most skilled and experienced mechanics. The function of law making and law construing requires not only special training, but constant and deliberate concentration, which the people acting as a whole have neither the time nor the persistent inclination to exert. Instead of attempting the impossible task of direct government the people should employ their energies in the simpler work of selecting the right representatives to perform for them the duties of the bench and the legislature. If they would enter into this work as zealously as they have followed the preachers of new faiths they would very quickly discover that the will of the people is already the sovereign power of the land, and that whatever the people deliberately desire and demand they will obtain—obtain thru the Constitution, not in violation of it; and that in so doing they are making substantial and permanent progress.

WASHINGTON, D. C.

Is the Cost of Living Really Increasing?

BY WILLIAM FREDERICK DIX

Author of "The Face in the Girandole," "The Lost Princess."

THE much discussed increased cost of living is more of a theory than an actual condition. People prattle about the steady growth in prices of commodities and complain of the present great expense of everything without realizing that, while the purchasing price of the dollar is less than it was a decade or so ago, they are, as a rule, earning more dollars. It isn't that living has gone up, but that the value of gold has gone down. The housemaid need not complain that she has to pay eight dollars for a hat which she formerly got for five dollars, because, when she was paying five, she was earning eighteen dollars a month, while she is now getting twenty-five, and her employer need not complain that he is paying her more wages, because he, likewise, is doubtless receiving more for his work. Overlooking this, however, he does complain, and he complains likewise of his high plumbers' and carpenters' bills, caused by the fact that these artisans, who were formerly getting two or three dollars a day now receive four or five. And those same plumbers and carpenters are complaining because they have to pay more for their food and clothes. And so it goes around the circle.

Why have prices gone up? Because the labor that produces everything receives more dollars. And we are all laborers and are getting those extra dollars, so why complain? The purchasing power of the dollar has simply grown less because gold is more plentiful and consequently it is a cheaper commodity. Suppose for a moment that the prices of everything should be put back to the scale of a decade ago—furniture and commutation tickets, millinery and house-building—would we rejoice? Would we stand it for a moment? Would the cabinet makers and railroad employees and silk weavers and carpenters accept the big cut in wages that would be necessary? Hardly. We all like to earn more dollars than formerly even if, by doing so, those dollars become less valuable. We sacrifice the quality in order to get the quantity. By their constant demands to their bosses, by trades union agitation, by strikes and otherwise, workmen have been, little by little, forcing their wages scale upward. They did not take into consideration that their increasing pay meant increasing cost of production of everything required for them to live, but, even if they did, they would rather be paid more and pay out more. If the same general set of influences which brought about an increased pay in one trade raised the cost of the product of that trade, these influences also increased the pay and the cost of the products in other trades.

An economic shifting of balance such as this country has been experiencing is a dangerous one to the social body. It arrays the employers against the employees, for the employers increase their wage scales only with great reluctance, and employees must fight for every increase, and this constant pressure which the latter put upon the former class causes restlessness, discontent and sometimes serious disorder, and it speaks well for the country that so much has been done with equanimity.

It would be impossible for us to adapt ourselves to the changed conditions with perfect serenity, for prices rise unevenly, just as the remuneration of different branches of work increases unevenly. One trade will receive an advance before another, one large commercial house will arrange an increased wage scale before its competitor does, and that will cause the employees in the other house to be seemingly underpaid. And in many establishments salaries will be raised individually, and the clerks who are not raised will be envious of the fortunate ones. So, at various times, nearly every worker will feel that his remuneration is not increased in a way commensurate with the cost of living, and he is dissatisfied. Meanwhile, directors in large in-

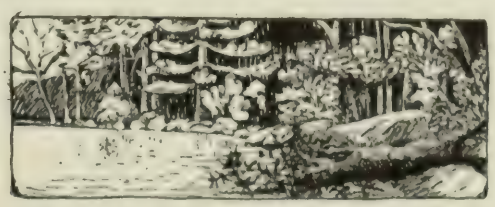
dustrial institutions, presidents of railways, public service companies, banking and commercial corporations, in addition to the regular problems of finance, maintenance, competition and so on, are constantly harassed by wage problems, labor agitation and strikes.

And the whole trouble is that dear old Mother Earth, out of her generosity, is giving us more and more gold! And, instead of being grateful, her children are discontented!

Another feature is apt to be lost sight of in connection with the increased cost of living—our wants have increased. We are not content to live as simply as we did a generation ago. If I remember rightly the best hotels in New York, twenty-five years ago, charged only five dollars a day for "room and board." The elaborately furnished "room and bath," with à la carte restaurant service, were unknown. Summer resort hotels charged even less. The famous old Crawford House, in the White Mountains, for instance, charged, I think, four dollars a day to transients and less by the week. There were no Mount Washington palaces in those days, nor such winter resorts as Palm Beach. A generation ago the average modest houseowner was contented with one bathroom, and the waitress—who received perhaps $12 to $16 a month—did not wear white cap and black uniform and serve every dish at his left elbow. The silver-plated cruet stand still adorned the center of the table, and when dinner was ready the dinner bell was rung. The modest houseowner did not dream of a motor car, as he most certainly does now; he did not belong to a golf club, and his wife did not yearn for her daily hint from Paris. He wore detachable cuffs and manicured his finger nails himself. Comparatively few people went abroad in those days, and when they did, compare the ship they sailed on with the monster floating palace of today! Hotels did not have valets on every floor and telephones in every bedroom, and a man with a hundred thousand dollars was considered wealthy. Every class of society is nowadays more luxurious, from the multi-millionaire, with town and country houses, shooting boxes in Scotland and a yacht on the Mediterranean, to the journeyman who has a steam-heated flat and the house servants who demand separate bedrooms and a bathroom, even in modest houses. Does your cook consent to do the family laundering on Mondays and Tuesdays nowadays?

One very important development in our national commercial life which has contributed to the cost of production of merchandise and consequent increase in their prices, and one which I cannot recall has ever been considered in this connection, is the extraordinary growth of the art of advertising inspired by the brilliant work of the various large advertising agencies. This new branch of the profession of middlemen has opened the eyes of manufacturers and the purses of buyers to an amazing degree. Compare the lavish advertisements in the magazines today, with their artistic illustrations and witty and terse text, with the crude, amateurish announcements of a generation ago. The writing of advertisements today is a literary development all its own, and the brief, pithy, attention compelling context in these illuminating pages has had a real effect upon literary style. A great modern advertising agency will take hold of a more or less moribund industry and inaugurate an aggressive campaign, which will make the house known from ocean to ocean and usher it into prosperity. A large percentage must be charged up by a manufacturing concern nowadays to the cost of production because of its advertising, and the buyer must necessarily pay for it. In other words, the buyer must pay for having the thing he buys made known to and urged upon him. Day after day he reads these alluring announcements in street cars, in circulars and in magazines till he comes to believe that life will not be complete till he has acquired a certain brand of chewing gum or fountain pen or garter or shingle stain or motor car. As the psychologist would express it, the constant appeal of the advertiser sinks into his inner consciousness, which will in time force his conscious volition to demand that he purchase, or words to that effect.

So the public pays for the privilege of being thus urged, and the effect is that the catalog of human wants and desires for the material comforts and luxuries of



this world has enormously increased. And, fortunately, our great prosperity enables us cheerfully to pay for the services of this great profession. And it undoubtedly has a great economic value, worthy of its remuneration because it galvanizes into life many feeble businesses and makes the prosperous ones even more prosperous. Many thousands of factories are built, many furnaces burn, many offices are kept busy, and countless thousands of workers are employed and supported by the prosperous public caused by the energy of the advertising agency. To drop into the vernacular, the advertisement delivers the goods because it makes the public come across.

While on the whole the increased pay people receive for their work fairly well balances the increase in their cost of living, there is one large and very honorable and useful class which suffers—the clerical forces of large concerns. Their scales of remuneration have not increased in twenty-five years. Office boys who got two or three hundred dollars a year a generation ago receive that same wage today. Clerks of almost every grade, bookkeepers, men and women employed behind counters, at desks, trusted, faithful young workers who must be fairly well educated, neatly dressed, accurate and honest—all the routine workers in banks, insurance offices, financial and commercial corporations of every description are struggling along at the old rates. They are not organized into any union and can only make individual requests, with no power behind them to influence their employers, and, almost without exception, the heads of these concerns, who are forced to pay more for everything else in the operation of their business, economize here. Many a young man remains unmarried because he cannot support a family, and those who are married find their house rents, food, clothes and everything steadily increasing with no corresponding remuneration for their faithful work.

This is where the shoe pinches, and to carry the metaphor further, it pinches the very foundations of business—the class of workers that does the yeoman work, keeping the wheels of trade running. Presidents of large corporations are eagerly piling up surplus or increasing their dividends to their stockholders, thereby adding to the value of their stock, themselves amassing wealth and enriching those who share in the ownership of the concern, and resolutely turn a deaf ear to the needs of the thousands of men and women whose comfort and prosperity depend upon their generosity, who have put their welfare into their keeping, giving daily, faithful work, and who now look in vain for the largesse which they deserve.

With this one important exception, and with the exception of the very few who have no earnings from work, but who live on the income of an invested estate—chiefly widows and retired business men, a class numerically very small —the chief difference between our life today and a generation ago lies in the change in customs rather than in any great shift in balance between cost and remuneration. European travel, wider reading, spread of education and culture, have made our wants greater. Formality, luxury, a new zest in sports and an emergence from cis-Atlantic provincialism, have been the chief factors in the evolution, so it seems rather absurd to complain of the alleged increased cost of living, does it not, when there isn't one of us who would go back to other times, other manners, even if it were possible to do so. Would you, for instance, have dear, well-meaning old Mother Earth tighten up her purse strings again?

The American Presidency

EDWARD STANWOOD'S *History of the Presidency from 1897 to 1909*,* a sequel to an earlier volume, issues from the press just before the people make, or try to make, one more President. The reader finds himself, in Chapter 1, living under William McKinley, with the ghost of bimetalism none too well laid, and the Dingley tariff bill about to be enacted—with the log-rolling amendments and disfigurements characteristic of American tariff legislation. Imperialism is about to become the "paramount issue," the United States developing into a world-power thanks to a Latin-American insurrection and the blowing up of the "Maine" in Havana harbor.

In one respect the situation in 1900 was without precedent since the adoption of the convention system. Both the leading candidates for the Presidency were as good as nominated months before the conventions. McKinley, the incumbent, was the Republican choice; Bryan the Democratic. The latter's capacity for leadership had already exprest itself more unmistakably than that of any earlier defeated candidate. But the emphasis of the 1900 campaign lay upon issues quite different to those of 1896. The Republican party shouldered the white man's burden, and, tho some of the most earnest anti-imperialists were lifelong Republicans, their protest was academic, for few of them supported the Democrat. It was a year of many nominations and heavy voting; 13,973,071 ballots were cast, or more than four years before, or four years after. The common impression that the aggregate vote given to the minor parties shows a tendency to increase is not substantiated by Mr. Stanwood's figures. The Socialist party has increased its vote largely at the last two elections, but its vote in 1908 was only slightly larger than in 1904. The following table is, perhaps, significant:

Year.	Minor candidates.
1880	318,883
1884	325,736
1888	400,510
1892	1,318,259
1896	538,881
1900	394,809
1904	809,881
1908	800,219

In 1896, the vote for Bryan and Watson under the Populist party emblem swelled the total. Four years earlier General Weaver, as the Populist nominee, polled 1,040,886 votes. In 1900, the increase of the Socialist and independent Populist vote is to be explained in part by the revolt of radical Democrats against the nomination of Judge Parker. It will be instructive to compare these statistics with those which will become available early in November.

How the act of an assassin may modify the national record is suggested in his sober manner by this historian in his chapter on McKinley's second term. The President seems to have cherished projects for developing our foreign trade, "and to reach that end by an important modification of the commercial policy." But his plans for reciprocity were checkmated by the crime at Buffalo, and a new President took office in 1901. Mr. Roosevelt's pledge to try "to continue absolutely unbroken the policy of President McKinley" was "absolutely sincere," and during the next three years the new executive "exercised self-repression." But the two men were "extraordinarily different in training and experience as well as in temperament and tastes and tendencies."
